b. Allowed for closed-circuit hydronic systems only: minimum 6 inch long brass nipple.

2.3 PIPING SPECIALTIES

A. See Section 230516 “Piping Specialties”.

2.4 SOLDER

A. S-1: Silfos or Silvaloy 15 silver solder (brazing) with 15 percent silver, 80 percent copper and 5 percent phosphorous.

B. S-1A: Safety Silv 56 cadmium-free silver solder (brazing) with 55 to 57 percent silver, 21 -23 percent copper, 15 to 19 percent zinc, 4 to 6 percent tin, and 0.15 percent other metals.

C. S-2, either.

1. 95 percent tin 5 percent antimony solder, lead free, or.
2. 95.6 percent tin, 4 percent copper, 0.4 percent silver, lead free.

PART 3 - EXECUTION

3.1 PIPE SERVICES

Service	Type of Pipe	Remarks
Above Ground Hydronic (HW, CHW)	PP-1; PP-2 Type L Hard	to 250 degrees Fahrenheit
Auxiliary pan drains	PP-2 Type L Hard	
Chemical water treatment	PP-2 Type L Hard	

3.2 INSTALLATION

A. Coordinate with work of other trades.

B. Install pipes and pipe fittings in accordance with recognized industry practices which will achieve permanently leak resistant piping systems, capable of performing each indicated service without piping failure. Install each run with minimum joints and couplings but with adequate and accessible unions for disassembly and maintenance/replacement of valves and equipment. Reduce sizes where indicated by use of reducing fittings. Align piping accurately at connections, within 1/16-inch misalignment tolerance.

C. Install underground piping per manufacturer's instructions.

D. Arrangement.

1. Except for large scale details piping is diagrammatically indicated. Install generally as shown.
2. Do not scale drawings for exact location of piping.
3. Install piping to best suit field conditions, in coordination with other trades.
4. Piping Arrangement.

    a. Arrange piping neatly along walls.
    b. In neat, horizontal groups.
    c. Each group to be in one plane, insofar as possible.
    d. Maintain required slope.

5. Do not sleeve structural members without consent of the Architect.
6. Maintain maximum 1-inch clearance from adjacent work, including insulation, except as noted.
7. Install piping concealed above ceilings or in walls unless otherwise indicated.
8. Installation of piping shall be made with use of appropriate fittings. Bending of piping will not be allowed.
9. Unions installed shall be accessible.
10. Locate piping runs vertically and horizontally; avoid diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. In finished and occupied spaces, conceal piping from view by locating in column enclosures, in hollow wall construction, or above suspended ceilings; do not encase horizontal runs in solid partitions, except as indicated.
11. Electrical equipment spaces: Do not run piping through transformer vaults and other electrical or electronic equipment spaces and enclosures unless the piping serves equipment in the room.

12. Use tapered reducers where any change in pipe size occurs. Bushings shall not be used.
13. Conceal piping in finished portions of building, above the floor line. Cutting of walls and floors shall be held to the minimum possible to secure the proper installation.
14. Provide concealed high points with air chambers with 1/4-inch copper tube vent line and stop cock carried to accessible point.
15. Install piping subject to expansion or contraction in a manner permitting strains to be evenly distributed and alleviated.
16. Pipe the discharge of each relief valve, air vent, backflow preventer, and similar device to floor sink or drain.

E. Installation of Protective Pipe Wrap.

1. Wrap pipe and fittings with two layers of protective wrap according to manufacturer's instructions. Overlap each layer of warp minimum 1/2 inch. Extend wrap three feet beyond section underground.
2. Protect all steel pipe buried in ground from corrosion by the application of protective pipe wrap. Clean and prime piping before application of the wrapping material.
3. No rocks or sharp edges shall be backfilled against the wrap. When backfilling with other than sand, protect wrap with an outer wrapping of Kraft paper; leave in place during backfill.
4. Wrap all copper piping below grade or concrete with plastic sleeve.

3.3 EXPANSION CONTROL

A. General.

1. Install piping to permit free expansion and contraction without damaging piping or construction.
2. Provide offsets, expansion loops, anchors, guides and supports to permit expansion, within stress limits of ANSI 31.1 Pressure Piping for temperature ranges specified.
3. Where pipe loops or changes in direction of piping cannot be employed to absorb expansion and contraction, provide expansion joints.
4. Install pipe guides so that movement takes place along axis of pipe only. Pipe moves laterally at expansion elbows.
5. Make riser offsets in manner to avoid pocket forming due to expansion.

B. Expansion Calculations.

1. Thermal Expansion.

a. Determine thermal linear expansion of each segment of piping systems.
b. Base expansion calculations on following temperatures, plus 30 percent safety factor.

1) Hot Water Heating.

a) Idle temperature: 50 degrees Fahrenheit.
b) Maximum temperature: 210 degrees Fahrenheit.

2) Chilled Water.

a) Operating temperature: 40 degrees Fahrenheit.
b) Maximum temperature: 100 degrees Fahrenheit.

c. Determine effect of linear expansion upon piping layout in building.

1) If resulting stresses exceed maximum allowable limits introduce additional loops and/or offsets.
2) Where space limitations preclude installation of loops and/or offsets provide expansion joints.

2. Structural Considerations

a. Install pipe anchors to provide required restraints on expanding piping systems.
b. Install pipe guides to provide required restraints against lateral action of expanding piping systems.

1) Spacing for expansion joints: per manufacturer's recommendations.
2) Spacing for pipe loops and/or offsets: as required to maintain alignment within allowable stress limits.

c. Locate anchors and guides only at building structural members capable of taking imposed reaction loads.
d. Determine horizontal and vertical reaction loads of anchors and guides to building structure.

1) Coordinate details and reaction loads with structural engineer for building.
2) If necessary, revise location and number of anchors and guides as recommended by structural engineer to result in allowable reaction loads to building.

C. Provision for Expansion.

1. Loops, bends, offsets.

a. As indicated or because of job required relocation of piping and equipment.
b. Design as follows:

1) Use spring type loop U-bend or offset U-bend.
2) Corner radii five to six times pipe diameters.
3) Join bends only by welding.

a) Welding-steel piping.
b) Brazing-copper or bronze piping.

D. Sloping, Air Venting and Draining.

1. Slope piping as indicated, true to line and grade, and free of traps and air pockets.
2. Reducers/increasers.

a. Eccentric.

1) At pump suction where reducer is required.
2) Top side flat.

b. Concentric: All other locations.

3. Connect branch piping to bottom of mains in closed systems.
4. Provide drain valves and hose adapters as indicated on drawings and at the bottom of all risers.

5. Vents: See Section 230516 “Piping Specialties.”

E. Piping Specialties: See Section 230516 “Piping Specialties.”

F. Pipe Hanging and Supports: See Section 230529 “Hangers and Supports.”

G. Copper.

1. Crimping of copper tubing prohibited.
2. Isolate copper tubing from ferrous materials and hangers with two thicknesses of 1 inch wide 10 mil polyvinyl tape, spiral-wrapped around pipe. Total width shall be a minimum of 3 inches.

H. Coatings: Reapply coal-tar coating on buried piping, after installation, to surfaces from which coating has been removed or scraped.

I. Pipe Identification: See Section 230553 “Mechanical Identification.”

J. Care of Floors.

1. Do not set pipe vises or threading machines on unprotected concrete floors.
2. Cover floor when making plumbing connections to avoid staining floors with oil, white or red lead or other substances.
3. Remove any stains at no additional cost to the Owner.

3.4 PIPE JOINTING

A. This section does not apply to refrigerant piping.

B. Fittings.

1. Provide standard, manufacturing fittings in all cases.
2. Prohibited fittings.

    a. Field fabricated.
    b. Bushings on pressure piping.
    c. Clamp-on branch connections.

3. Provide insulating couplings or dielectric unions at all connections of ferrous piping to non-ferrous piping.
4. Branch connections, steel piping.

    a. Equal to main and to two pipe sizes smaller: weld tees, same weight as piping.
    b. Three or more pipe sizes smaller than main, but 2-1/2 inches and larger: Bonney Weld-o-lets.
    c. Two inches and smaller: Bonney Weld-o-lets, Thread-o-lets, threaded Nip-o-lets, or steel couplings.

C. Unions: Provide unions or flanges to render all items in systems easily removable, including.

1. Control valves.
2. Both sides of pumps and equipment.
3. Where indicated on drawings.
4. Exceptions.

a. Copper water piping 1-inch or less, at Contractor's options, since the copper can be easily cut and the union is a less secure joint than a soldered joint.
b. Where unions are not allowed by code: Unions not allowed.

D. Pipe Ends.

1. Perform pipe cutting and end preparation to result in clean ends with full inside diameter.
2. Grind and ream as necessary.

E. Nipples.

1. Close nipples not permitted.
2. Provide extra heavy pipe for nipples where unthreaded portion is less than 1-1/2 inch long.

F. Threaded Joints: not allowed other than unions.

G. Welded Joints.

1. Weld pipe joints in accordance with recognized industry practice and as follows:

a. Welding shall be done by qualified welders in a first-class, workmanlike manner, conforming to the American Standard Code for Pressure Piping USA B-31.1 and B-31.1A.
b. Bevel pipe ends at a 37.5 degree angle where possible, smooth rough cuts, and clean to remove slag, metal particles, and dirt.
c. Do not weld-out piping system imperfections by tack-welding procedures; re-fabricate to comply with requirements.
d. Standards: Conform to Section UI, Chapter 4, "Welding of Pipe Joints", ANSI B31.1 and applicable portion of ASME Boiler and Pressure Vessel Code, Section IX.
e. Operator's qualifications: All welders engaged in work under this Section shall be qualified in accordance with State requirements. Each operator's certificate shall be on file at site and made available to State upon request. Welding of pressure piping shall be done by-welders who have been qualified by recognized agency within 6 months prior to date of Contract.
f. Preparation for welding: Bevel piping on both ends before welding; both ends shall have 1-1/6 inch land at bottom of bevel. Pipe with a 3/4 inch wall thickness or less shall be beveled to a standard 37.5 degrees.
g. Use backing rings on all butt-welding joints 6-inches and larger.
h. State employed Inspector will visually inspect welds. Any weld judged defective by visual inspection shall be cut out and tested in presence of Inspector. If percentage of defective coupons is deemed excessive, contractor shall cut additional coupons as directed by the Architect or the State Inspector. Removal and replacement of test coupons and samplings shall be done at no additional cost to the Owner. At the option of the State Inspector or the Architect, certain welds may be required to be radiographed.

2. Where required, peen and wheel-grind welds.
3. Ends of pipe may be burned for welding.

a. Grind bevel and remove scale between welding joint.
b. Ragged edges with metal beads, poor alignment other inferior work will be rejected.

4. Perform welding with oxyacetylene or electric arc process.

H. Soldered and Brazed Joints.

1. Solder.

    a. Use Solder S-1 for underground copper piping.
    b. Use Solder S-2 other than above.

2. Clean surfaces to be jointed, of oil, grease, rust and oxides.

    a. Remove grease from fittings by washing in solution of 1/16 sodium carbonate and three gallons hot water (except as otherwise specified for medical gas piping).
    b. Clean socket of fitting and end of pipe thoroughly with emery cloth to remove rust and oxides.
    c. Wipe excess solder from joint before it hardens.

3. When soldering or brazing materials that could be damaged by heat, remove sensitive parts and protect parts from heat. Joints shall be cool before reassembling valve.
4. Cut tubing square, reamed, and burrs removed.
5. Prevent annealing of fittings and tubing when making connections.

3.5 FLASHING AND SLEEVES

A. See Section 230529 “Hangers and Support.”

3.6 CLEANING

A. General.

1. During Construction.

    a. Keep openings in piping closed to prevent entrance of foreign matter.
    b. Clean pipe, fittings and valves internally.
    c. Hammer welds to remove slag and weld beads.

2. Clean system after pressure test. Do NOT let system sit filled with un-chemically treated water for more than 4-hours.

B. Cleaning Procedure.

1. Upon start-up fill with clean water.
2. Add alkaline detergent.

    a. Sodium silicate and/or sodium phosphate with non-foaming wetting agent.
    b. Phenolphthalein alkalinity to 2000 to 5000 parts per million as CaCo/3.
    c. Supplied and supervised by water treatment company.

3. Install temporary filter bags in line strainers during start-up.
4. Circulate water of each system at respective design flow rates or greater.

    a. Three 8-hour periods.
    b. At end of each 8-hour period remove and clean strainers and blow off low points.
    c. After third period, completely drain out entire systems of cleaning solution and removed filters at strainers.

d. Refill systems with clean water and circulate for additional 8-hour period at end of which interval, completely drain systems.
e. Drain, refill with clear water; circulate.
f. Test for alkalinity.

1) Not more than 200 parts per million in excess of alkalinity of rinsing water.
2) Repeat flushing of water of each system at respective minimum design flow rate as described above, until 200 parts per million or less.

5. Protect against damage from freeze up or discharge of water.
6. Should any pipe be plugged or should foaming of water systems occur, disconnect piping, clean again, and reconnect at no additional cost to the Owner.

C. Upon completion of cleaning, dose system with chemicals to obtain corrosion inhibition conditions as recommended by water treatment company.

3.7 FIELD QUALITY CONTROL

A. Testing of Water Piping.

1. Test water piping at completion of roughing in, in accordance with the following schedule and show no loss in pressure or visible leaks after a minimum duration of four hours, or time as indicated, at the test pressures indicated.
2. Make connections to existing systems with flanged connection. During testing of the new work, provide a slip-in plate to restrict test pressure to new systems only. Remove plate and complete connection to existing system at completion of testing.
3. Inspect pressure piping in accordance with procedures of ANSI B31.
4. Less than 100 pounds per square inch operating pressure: Test hydrostatically to 150 pounds per square inch.
5. Over 100 pounds per square inch operating pressure.

a. Test hydrostatically to 1-1/2 times operating pressure.
b. Never exceed test pressure ANSI B16.1 basis.

6. Duration: 2 hours.

a. With system valves capped and pressure apparatus disconnected.

1) Pressure change: none.
2) Compensate for temperature change.

7. Leaks and defects.

a. Repair or replace as directed by the Architect.
b. At no additional cost to the Owner.

8. Notify Architect in writing one week before test.
9. Furnish written report and certification that tests have been satisfactorily completed to the Architect.
10. Include written report and certification that tests have been satisfactorily completed.
11. Final connection to system shall be witnessed by Architect.

Hydronic Piping Test Log							
Date	System	Description of Piping Section Tested	Test Press. (psig)	Test Duration (hours)	Results Pass/ Fail	Witness (Contractor) Initials	Witness (Professional) Initials

This form stall be completed and submitted with the project closeout documents. Contractor shall copy this form if more sheets are required. Piping pressure test log shall be kept at project site and shall be made available to the Architect upon request.

END OF SECTION 23 21 13

SECTION 23 21 23

PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for all water pumps except.

1. Where integral with manufactured piece of equipment.
2. Where specialty pumps applicable to specific systems are specified under the relevant Section.

1.3 REFERENCE STANDARDS

A. Underwriters' Laboratories, Inc.: UL 778 – Motor Operated Water Pumps.

B. American Society of Mechanical Engineers: ASME Section VIII – Boiler and Pressure Vessel Code – Pressure Vessels.

C. ANSI/HI Pump Standards.

1.4 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Pump data	R	R		R
Mounting details				R

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

1. ITT, Bell and Gossett.
2. Grundfos (PACO).
3. Armstrong.
4. Or equal.

2.2 GENERAL

A. Centrifugal, single stage, unless otherwise noted.

B. Bronze fitted.

C. Statically and dynamically balance rotating parts.

D. Construction to permit complete servicing without breaking piping connections.

E. Pumps to operate at 1750 rpm unless specified otherwise.

F. Bearings: Grease lubricated roller or ball bearings.

G. Shaft seals.

1. Mechanical.
2. Single, inside mounted, end face rubber bellows type.
3. Springs: stainless steel.
4. Seal head: brass or stainless steel.
5. Babbitt filled carbon rotating washer.
6. Stationary seat: Ni-Resist.
7. Elastomer: EPDM.

H. Substitutions.

1. Brake horsepower rating at design conditions shall be no more than 10 percent above that scheduled.
2. Motor horsepower shall be no larger than that scheduled, or compensate Division 26 contractor for any associated cost to increasing motor size.

I. Motors: See pump schedule and Section 230513 “Common Motor Requirements for HVAC Equipment.”

J. Pump characteristics.

1. Pump curve shall rise continuously from maximum capacity to shutoff.
2. Shutoff head approximately 10 percent greater than design head.
3. Operation at or near peak efficiency.

4. For pumps serving variable flow (2-way valve) systems; or where multiple pumps operate in parallel other than lead/standby applications.

    a. Pump shall be capable of operating at 40 percent beyond design flow rate without exceeding break off point.
    b. Motors shall be selected for non-overloading operation at a flow rate 40 percent beyond design flow rate.

5. Impeller diameter.

    a. Maximum 90 percent of maximum published impeller diameter.
    b. Constant speed pumps: Trim to duty.
    c. Variable speed pumps: Trim to the maximum impeller size that does not cause an increase in motor size (so that maximum efficiency is achieved).

K. Pumps and flanges tested and rated to withstand 1-1/2 times specified working pressures based on both inlet pressures scheduled and pump shut-off head or 175 pounds per square inch working pressure at 250 degrees Fahrenheit, whichever is greater.

L. Pumps to be suitable for handling fluids at scheduled temperatures.

M. Pressure taps on both inlet and outlet for gauge connection mounted in the pump casing (not in external piping).

N. Factory tested.

O. Painted with at least one coat of high-grade machinery enamel.

2.3 END SUCTION

A. Base/motor type as scheduled.

1. Close-coupled.

    a. Back pullout feature for easy replacement of seals.
    b. Mounting base that provides sufficient height so the pump casing is above the bottom of the base feet (not requiring the pump to hang out over the front of the inertia base or housekeeping pad).

B. Mounting base that provides sufficient height so the pump casing is above the bottom of the base feet (not requiring the pump to hang out over the front of the inertia base or housekeeping pad).

C. Shaft: stainless steel.

D. Casing wearing ring: None.

E. Suction and discharge connections: flanged or threaded.

2.4 IN-LINE

A. Type as scheduled.

1. Close coupled.
2. Back pullout design.
3. Suitable for horizontal or vertical operation.

B. Shaft: stainless steel.

C. Wearing rings: renewable bronze.

D. Shaft sleeves: bronze.

E. Casing with suction and discharge gauge ports, vent and plugged drain ports.

F. Capable of being serviced without disturbing piping connections.

G. Pump volute base ring tapped for 1-1/2 inch 125 pound ANSI flange to support pump.

H. Pump flanges to have 125 pound ANSI flange drilling.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Install pump in accordance with manufacturer's written installation instructions.

C. Provide access space around pumps for service. Provide no less than minimum as recommended by manufacturer.

D. Install on isolation base or housekeeping pad as specified.

E. Decrease to pump suction from line size with flat-top eccentric reducers on horizontal inlet piping (or suction diffuser where indicated on drawings), concentric reducers elsewhere.

F. Support piping adjacent to pump such that no weight is carried on pump casings.

G. Allow at least 5 pipe diameters between pump suction entry and closest elbow, unless a pump suction diffuser is installed.

H. Inlet and discharge valves and other piping specialties shall be pipe size, not pump inlet or discharge connection size.

I. Equipment Mounting:

1. Install base-mounted pumps on cast-in-place concrete equipment bases.

J. Floor mounted pumps: mount base to foundation or inertia base.

1. Bolts in embedded pipe sleeve.
2. Double nuts or shims to form level assembly.

K. Equipment Mounting: Install in-line pumps with continuous-thread hanger rods and spring hangers with vertical-limit stop of size required to support weight of in-line pumps.

3.2 MOUNTING AND ALIGNMENT

A. See Section 230548 – Mechanical Sound and Vibration Control.

B. Floor mounted pumps: mount base to foundation or inertia base.

1. Bolts in embedded pipe sleeve.
2. Double nuts or shims to form level assembly.

C. Pour non-shrink grout under base, filling voids, and allow to set.

3.3 INSPECTION

A. Verify that adequate clearance between pump and adjacent walls or equipment is available to permit maintenance and repairs.

B. Check that pump is suspended from building structure and not supported by piping.

3.4 PRE-OPERATING CHECKS

A. Before operating pumps.

1. Assure that piping is clear of debris which might clog pump.
2. Vent air from pump system to assure water in pump and piping system.
3. Check for proper and sufficient lubrication.
4. Check for correct operation of check valve.
5. Check for correct rotation.
6. Confirm alignment again after grouting has properly set and re-align if required.
7. Check packing nut adjustment for proper leakage rate and packing lubrication.
8. Assure that strainer is clean before commencing testing.
9. Check for proper adjustment of vibration isolation.

3.5 TESTING AND ADJUSTING

A. After starting pumps.

1. Check for high bearing temperatures.
2. Check temperature of packing gland or mechanical seal for proper cooling operation.
3. Check for motor overload by taking ampere reading at maximum operating conditions, i.e. all valves open and individual pump running.
4. Check shut-off head to ensure impellers properly trimmed.

B. See Section 230593 – Testing, Adjusting, and Balancing.

3.6 TRAINING

A. See Sections 230010 – Mechanical General Provisions.

B. Engage a factory-authorized service representative to train Owner's maintenance personnel on.

1. Procedures for starting and stopping and troubleshooting pumps.
2. Procedures and schedules for maintaining and servicing pumps.
3. Organization and content of Operations & Maintenance Manuals.

END OF SECTION 23 21 23

SECTION 23 23 00

REFRIGERANT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes materials, equipment, fabrication, special-duty valves, specialties, and installation for the following:

1. Refrigerant piping.

1.3 REFERENCE STANDARDS

A. ANSI/ARI 495 – Refrigerant Liquid Receivers.

B. ANSI/ARI 710 – Liquid Line Dryers.

C. ANSI/ASHRAE 34 – Number Designation of Refrigerants.

D. ANSI/ASTM B32 – Solder Metal.

E. ANSI/ASTM B88 – Seamless Copper Water Tube.

F. ASTM B280 – Seamless Copper Tube for Air Conditioning and Refrigeration Field Service.

G. ANSI/AWS A5.8 – Brazing Filler Metal.

H. ANSI/AWS D1.1 – Structural Welding Code.

1.4 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Piping and fitting materials	R			R
Valves and specialties	R			R
Solder	R2			

1.5 QUALITY ASSURANCE

A. Each length of pipe, fitting, trap, fixture or device used in any piping system shall be stamped or indelibly marked with:

1. Weight or quality.
2. Maker's name or mark.

B. Examine piping layouts and determine requirements for piping offsets, loops or expansion joints to adequately protect systems.

1. Determine locations and design of anchors and pipe guides to maintain proper piping alignment.
2. Determine anchor reaction forces and coordinate locations of anchors with Architect.

C. Conform to ANSI/ASME B31.1.

1.6 PERFORMANCE REQUIREMENTS

A. Line Test Pressure for Refrigerant R-410A.

1. Suction Lines for Air-Conditioning Applications: 300 psig.
2. Suction Lines for Heat-Pump Applications: 535 psig.
3. Hot-Gas and Liquid Lines: 535 psig.

PART 2 - PRODUCTS

2.1 COPPER TUBE AND FITTINGS

A. Copper Tube: ASTM B 280, Type ACR.

B. Wrought-Copper Fittings: ASME B16.22.

C. Wrought-Copper Unions: ASME B16.22.

D. Solder Filler Metals: ASTM B 32. Use 95-5 tin antimony or alloy HB solder to join copper socket fittings on copper pipe.

E. Brazing Filler Metals: AWS A5.8.

F. Flexible Connectors:

1. Body: Tin-bronze bellows with woven, flexible, tinned-bronze-wire-reinforced protective jacket.
2. End Connections: Socket ends.
3. Offset Performance: Capable of minimum 3/4-inch misalignment in minimum 7-inch- long assembly.
4. Pressure Rating: Factory test at minimum 500 psig.
5. Maximum Operating Temperature: 250 ˚F.

2.2 VALVES AND SPECIALTIES

A. Service Valves:

1. Body: Forged brass with brass cap including key end to remove core.
2. Core: Removable ball-type check valve with stainless-steel spring.
3. Seat: Polytetrafluoroethylene.
4. End Connections: Copper spring.
5. Working Pressure Rating: 500 psig.

B. Solenoid Valves: Comply with ARI 760 and UL 429; listed and labeled by an NRTL.

1. Body and Bonnet: Plated steel.
2. Solenoid Tube, Plunger, Closing Spring, and Seat Orifice: Stainless steel.
3. Seat: Polytetrafluoroethylene.
4. End Connections: Threaded.
5. Electrical: Molded, watertight coil in NEMA 250 enclosure of type required by location with 1/2-inch (16-GRC) conduit adapter, and 24-V ac coil.
6. Working Pressure Rating: 400 psig.
7. Maximum Operating Temperature: 240 ˚F.
8. Manual operator.

C. Thermostatic Expansion Valves: Comply with ARI 750.

1. Body, Bonnet, and Seal Cap: Forged brass or steel.
2. Diaphragm, Piston, Closing Spring, and Seat Insert: Stainless steel.
3. Packing and Gaskets: Non-asbestos.
4. Capillary and Bulb: Copper tubing filled with refrigerant charge.
5. Suction Temperature: See DX Coil (AHU) Schedule.
6. Superheat: Adjustable.
7. Reverse-flow option (for heat-pump applications).
8. End Connections: Socket, flare, or threaded union.
9. Working Pressure Rating: 700 psig.

D. Moisture/Liquid Indicators:

1. Body: Forged brass.
2. Window: Replaceable, clear, fused glass window with indicating element protected by filter screen.
3. Indicator: Color coded to show moisture content in ppm.
4. Minimum Moisture Indicator Sensitivity: Indicate moisture above 60 ppm.
5. End Connections: Socket or flare.
6. Working Pressure Rating: 500 psig.
7. Maximum Operating Temperature: 240 ˚F.

E. Replaceable-Core Filter Dryers: Comply with ARI 730.

1. Body and Cover: Painted-steel shell with ductile-iron cover, stainless-steel screws, and neoprene gaskets.
2. Filter Media: 10 micron, pleated with integral end rings; stainless-steel support.
3. Desiccant Media: Activated alumina.
4. End Connections: Socket.
5. Access Ports: NPS 1/4 connections at entering and leaving sides for pressure differential measurement.
6. Maximum Pressure Loss: 2 psig.
7. Working Pressure Rating: 500 psig.
8. Maximum Operating Temperature: 240 ˚F.

2.3 REFRIGERANTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Atofina Chemicals, Inc.
2. DuPont Company; Fluorochemicals Div.
3. Honeywell, Inc.; Genetron Refrigerants.
4. Or equal.

B. ASHRAE 34, R-410A: Pentafluoroethane/Difluoromethane.

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS FOR REFRIGERANT R-410A.

A. Suction Lines NPS 3-1/2 and Smaller for Conventional Air-Conditioning Applications: Copper, Type ACR, drawn-temper tubing and wrought-copper fittings with brazed or soldered joints.

B. Hot-Gas and Liquid Lines: Copper, Type ACR, annealed- or drawn-temper tubing and wrought-copper fittings with brazed or soldered.

3.2 VALVE AND SPECIALTY APPLICATIONS.

A. Install solenoid valves upstream from each expansion valve and hot-gas bypass valve. Install solenoid valves in horizontal lines with coil at top.

B. Install thermostatic expansion valves as close as possible to distributors on evaporators.

1. Install valve so diaphragm case is warmer than bulb.
2. Secure bulb to clean, straight, horizontal section of suction line using two bulb straps. Do not mount bulb in a trap or at bottom of the line.
3. If external equalizer lines are required, make connection where it will reflect suction-line pressure at bulb location.

C. Install moisture/liquid indicators in liquid line at the inlet of the thermostatic expansion valve or at the inlet of the evaporator coil capillary.

D. Install filter dryers in liquid line between compressor and thermostatic expansion valve.

E. Install flexible connectors at condensing units.

3.3 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems; indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Shop Drawings.

B. Install refrigerant piping according to ASHRAE 15.

C. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping adjacent to machines to allow service and maintenance.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Select system components with pressure rating equal to or greater than system operating pressure.

J. Install piping as short and direct as possible, with a minimum number of joints, elbows, and fittings.

K. Arrange piping to allow inspection and service of refrigeration equipment. Install valves and specialties in accessible locations to allow for service and inspection. Install access doors or panels if valves or equipment requiring maintenance is concealed behind finished surfaces.

L. Install refrigerant piping in protective conduit where installed belowground.

M. Install refrigerant piping in rigid or flexible conduit in locations where exposed to mechanical injury.

N. Slope refrigerant piping as follows:

1. Install horizontal hot-gas discharge piping with a uniform slope downward away from compressor.
2. Install horizontal suction lines with a uniform slope downward to compressor.
3. Liquid lines may be installed level.

O. When brazing or soldering, remove solenoid-valve coils and sight glasses; also remove valve stems, seats, and packing, and accessible internal parts of refrigerant specialties. Do not apply heat near expansion-valve bulb.

P. Install piping with adequate clearance between pipe and adjacent walls and hangers or between pipes for insulation installation.

Q. Identify refrigerant piping and valves according to Section 230553 “Identification for HVAC Piping and Equipment.”

R. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 230517 “Sleeves and Sleeve Seals for HVAC Piping.”

S. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 230517 “Sleeves and Sleeve Seals for HVAC Piping.”

T. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 230518 “Escutcheons for HVAC Piping.”

3.4 PIPE JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Fill pipe and fittings with an inert gas (nitrogen or carbon dioxide), during brazing or soldering, to prevent scale formation.

D. Soldered Joints: Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook."

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube."

1. Use Type BcuP, copper-phosphorus alloy for joining copper socket fittings with copper pipe.
2. Use Type BAg, cadmium-free silver alloy for joining copper with bronze or steel.

3.5 HANGERS AND SUPPORTS

A. See Section 230529 “Hangers and Supports for HVAC Piping and Equipment.”

B. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal runs less than 20 feet long.
2. Copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.

C. Install hangers for copper tubing with the following maximum spacing and minimum rod sizes:

1. NPS 1/2: Maximum span, 60 inches; minimum rod size, 1/4 inch.
2. NPS 5/8: Maximum span, 60 inches; minimum rod size, 1/4 inch.
3. NPS 1: Maximum span, 72 inches; minimum rod size, 1/4 inch.
4. NPS 1-1/4: Maximum span, 96 inches; minimum rod size, 3/8 inch.
5. NPS 1-1/2: Maximum span, 96 inches; minimum rod size, 3/8 inch.

6. NPS 2: Maximum span, 96 inches; minimum rod size, 3/8 inch.
7. NPS 2-1/2: Maximum span, 108 inches; minimum rod size, 3/8 inch.

D. Support multi-floor vertical runs at least at each floor.

3.6 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

B. Tests and Inspections:

1. Comply with ASME B31.5, Chapter VI.
2. Test refrigerant piping, specialties, and receivers. Isolate compressor, condenser, evaporator, and safety devices from test pressure if they are not rated above the test pressure.
3. Test high- and low-pressure side piping of each system separately at not less than the pressures indicated in Part 1 "Performance Requirements" Article.

    a. Fill system with dry nitrogen to the required test pressure.
    b. System shall maintain test pressure at the manifold gage throughout duration of test.
    c. Test joints and fittings with electronic leak detector or by brushing a small amount of soap and glycerin solution over joints.
    d. Remake leaking joints using new materials and retest until satisfactory results are achieved.

3.7 SYSTEM CHARGING

A. Charge system using the following procedures:

1. Install core in filter dryers after leak test but before evacuation.
2. Evacuate entire refrigerant system with a vacuum pump to 500 micrometers. If vacuum holds for 12 hours, system is ready for charging.
3. Break vacuum with refrigerant gas, allowing pressure to build up to 2 psig.
4. Charge system with a new filter-dryer core in charging line.

3.8 ADJUSTING

A. Adjust thermostatic expansion valve to obtain proper evaporator superheat.

B. Adjust high- and low-pressure switch settings to avoid short cycling in response to fluctuating suction pressure.

C. Adjust set-point temperature of air-conditioning or chilled-water controllers to the system design temperature.

D. Perform the following adjustments before operating the refrigeration system, according to manufacturer's written instructions:

1. Verify that compressor oil level is correct.
2. Open compressor suction and discharge valves.

3. Open refrigerant valves except bypass valves that are used for other purposes.

E. Replace core of replaceable filter dryer after system has been adjusted and after design flow rates and pressures are established.

Refrigerant Piping Test Log							
Date	System	Description of Piping Section Tested	Test Press. (psig)	Test Duration (hours)	Results Pass/ Fail	Witness (Contractor) Initials	Witness (Professional) Initials
This form stall be completed and submitted with the project closeout documents. Contractor shall copy this form if more sheets are required. Piping pressure test log shall be kept at project site and shall be made available to the Architect upon request.							

END OF SECTION 23 23 00

SECTION 23 25 00

WATER TREATMENT – CLOSED SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Services of water treatment firm.
2. Chemicals.
3. Systems provided with water treatment prior to testing and starting for regular operation.

B. Intent of the Section is to provide complete chemical treatment to protect the following systems from scale formations, corrosion, algae and slime growth.

1. Chilled water.
2. Hot water.

1.3 WATER TREATMENT SERVICES

A. Retain qualified water treatment specialist for complete water treatment service including:

1. Perform analysis of water conditions, including local makeup water.
2. Recommend methods and materials required to comply with Paragraph 1.2B above.
3. Furnish all water treatment chemicals.
4. Supervise installation of water treatment chemicals and systems.
5. Provide written report of makeup water conditions and recommended methods and materials for initial and ongoing treatment of all piping systems.
6. Relieve operating staff and contractor of all responsibility for chemical handling, water testing and adjusting water treatment equipment during Warranty Treatment Period (other than providing required maintenance of treatment equipment).
7. Conduct monthly visits of qualified technical representative to:

    a. Collect samples from each treated system for analysis at firm laboratory.
    b. Inspect and adjust of water treating devices.

B. Water Treatment Period:

1. Water treatment applied concurrently with operation of each system for 1 year after project Substantial Completion.

2. Upon completion of the Warranty Treatment Period, inform Owner in writing of various types of service agreements available.

1.4 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Piping diagram	R			
Bypass chemical feeders	R	R		R
Chemicals	R	R		R
Water analysis	R	R		
Water treatment services	R			

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Water Treatment Service and Chemicals.

1. Anderson Chemical.
2. Chem-Aqua.
3. Nalco Chemical.
4. GE Betz.
5. Certified.
6. Or equal.

C. Bypass chemical feeders.

1. J.L. Wingert Co.
2. Industrial Chemical Corporation.
3. Or equal.

2.2 GENERAL

A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

B. Chemical Feed System Description:

1. Closed-Loop System: One bypass feeder on each system with isolating and drain valves with inlet piping connecting to discharge of circulating pumps, and outlet side of feeder connected to suction side of pump unless otherwise indicated.

a. Introduce chemical treatment through bypass feeder when required or indicated by test.

2.3 PERFORMANCE REQUIREMENTS

A. Maintain water quality for HVAC systems that controls corrosion and build-up of scale and biological growth for maximum efficiency of installed equipment without posing a hazard to operating personnel or the environment.

B. Base HVAC water treatment on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.

C. Closed-Loop System: Maintain system essentially free of scale, corrosion, and fouling to sustain the following water characteristics:

1. Conductivity: 1200 to 2500 umhos. (nitrite raises system conductivity).
2. Acceptable pH: Not less than 7.0 or greater than 8.5 (except for piping flush and clean step where the pH level is in the alkaline range of 9.5 to 10.5).
3. Hardness: < 5 ppm. (when closed loops have soft water make-up water).

2.4 CHEMICAL FEEDING EQUIPMENT

A. Bypass Chemical Feeders.

1. Batch feeder for closed circulating water systems.
2. Install feeder in convenient location where it may be easily refilled, maximum 4 feet above floor.
3. Install as indicated on drawings.

a. Support from floor.
b. Valves on air release, inlet, outlet and drain.
c. Air release valve on top.
d. Drain valve on bottom.
e. Capacity: 5 gallons.
f. 3/4-inch tappings.
g. Dome bottom with legs.
h. Steel or stainless steel.
i. Cap: Cast iron with Buna N O-ring: Quarter turn to open.
j. Operating pressure and temperature:

1) Minimum rated operating pressure up to 125 pounds per square inch.
2) Minimum rated operating temperature up to 250 °F.

4. Wingert Model DB-5HD or equal.

2.5 CHEMICAL TREATMENT TEST EQUIPMENT

A. Test Kit: Manufacturer recommended equipment and chemicals, in a carrying case, for testing pH, total dissolved solids, dissolved oxygen, biocount, chloride, and total alkalinity and for calcium hardness field tests.

B. Corrosion Test Coupon Assembly: Constructed of corrosion material, complete with piping, valves, and mild steel and copper coupons. Locate copper coupon downstream from mild steel coupon in the test coupon assembly.

1. Two-station rack for closed-loop systems.

2.6 CHEMICALS

A. Furnish chemicals recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment.

B. Provide supply of the following chemicals for treatment of water systems during the treatment period identified in 1.3B.

C. System Cleaner: Liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products.

D. Biocide: Chlorine release agents or microbiocides.

E. Closed-Loop, Water Piping Chemicals: Sequestering agent to reduce deposits and adjust pH, corrosion inhibitors, and conductivity enhancers.

F. All products shall be properly registered with the US Environmental Protection Agency and EPA registration number shall be clearly shown on all product literature and drum labels.

PART 3 - EXECUTION

3.1 WATER ANALYSIS

A. Perform an analysis of supply water to determine the type and quantities of chemical treatment needed to maintain the water quality as specified in "Performance Requirements" Article.

3.2 INSTALLATION

A. Per manufacturer’s recommendations

B. Install chemical application equipment on concrete bases level and plumb. Maintain manufacturer's recommended clearances. Arrange units so controls and devices that require servicing are accessible. Anchor chemical tanks and floor-mounting accessories to substrate.

C. Install water-testing equipment on white polypropylene backboard (on wall or free-standing support structure) near water-chemical-application equipment.

D. Install interconnecting control wiring for chemical treatment controls and sensors.

E. Mount sensors and injectors in piping circuits.

F. Bypass chemical feeders.

1. Mount on floor with top of reservoir tank maximum 4 feet above floor.
2. Supply to bottom of feeder to encourage mixing.

G. Valves and Piping.

1. See Section 232112 – Heating and Cooling Piping for piping materials and installation.
2. See drawings; arrange to be confirmed by manufacturer.

3.3 INITIAL CLEANING OF SYSTEMS

A. Prior to operation clean system as specified in Section 232112 – Heating and Cooling Piping.

B. Upon completion of cleaning, dose system with chemicals to obtain specified corrosion inhibition conditions.

3.4 START-UP AND SUPERVISION

A. Provide installation supervision and start-up automatic water treatment systems by qualified representative of water treatment equipment/chemical supplier.

3.5 TRAINING

A. Engage a factory-authorized service representative to train Owner's maintenance personnel on:

1. Procedures for programming and troubleshooting controllers.
2. Procedures and schedules for testing and maintaining water quality.
3. Organization and content of Operations & Maintenance Manuals.

END OF SECTION 23 25 00

SECTION 23 31 13

DUCTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Ductwork.
2. Plenums.
3. Boiler flues and breechings.
4. Fasteners, sealants, and gaskets.
5. Hangers and supports.

1.3 REFERENCE STANDARDS

A. SMACNA HVAC Duct Construction Standards, latest edition.

1.4 DEFINITIONS

A. Seam: locks or weld applied longitudinally to close section of duct, for example longitudinal seam, spiral seam.

B. Joint: abutting connection between duct sections for continuity of air passage, for example cross joint, transverse joint, coupling.

C. Reinforcement: hardware applied to strengthen duct, for example girth angles, tie rods, fasteners (not connectors), and the like.

D. Stiffening: folding, bending, beading, crossbreaking or corrugating of sheets to achieve strength through shape, for example pocket lock secures joint and is transverse stiffener, with girth angle and fasteners applied (not connectors), joint or stiffener is reinforced.

E. Duct Classification:

1. Velocity:

a. Low: to 2000 feet per minute.
b. High: above 2000 feet per minute.

2. Pressure classification: except as indicated on the Drawings:

    a. Low: to 2 inches water gauge.
    b. Medium: above 2 inches to 6 inches water gauge. Default 3 inches if not otherwise indicated on the Drawings.
    c. High: above 6 inches water gauge.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements.

1. Entire ductwork system, including materials and installation, installed in accordance with NFPA 90A.
2. Ductwork and components shall be listed as U.L. 181, 181A and 181B, Class I air duct, flame rating not to exceed 25 and smoke rating not to exceed 50.
3. Flues shall conform to the requirements of NFPA-211. Products shall be listed to UL-103 and shall carry the appropriate UL listing mark or label.

B. Mockups:

1. Before installing duct systems, build mockups representing static-pressure classes in excess of 2inch wg. Build mockups to comply with the following requirements, using materials indicated for the completed Work:

    a. Five transverse joints.
    b. One access door(s).
    c. Two typical branch connections, each with at least one elbow.
    d. Two typical flexible duct or flexible-connector connections for each duct and apparatus.
    e. One 90-degree turn(s) with turning vanes.
    f. One fire damper(s).
    g. Perform leakage tests specified in "Field Quality Control" Article. Revise mockup construction and perform additional tests as required to achieve specified minimum acceptable results.

2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.6 SUBMITTALS

A. See Section 230010 Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

C. Product Data: For each type of the following products:

1. Liners and adhesives.
2. Sealants and gaskets.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Ductwork materials and fittings	R			R
Duct fasteners, sealants, and gaskets	R			
Flexible duct	R			R
Flue	R			R
Duct pressure testing reports		R		

D. Mockups:

1. Before installing duct systems, build mockups representing static-pressure classes in excess of 3-inch wg. Build mockups to comply with the following requirements, using materials indicated for the completed Work:

   a. Five transverse joints.
   b. One access door(s).
   c. Two typical branch connections, each with at least one elbow.
   d. Two typical flexible duct or flexible-connector connections for each duct and apparatus.
   e. One 90-degree turn(s) with turning vanes.
   f. One fire damper(s).
   g. Perform leakage tests specified in "Field Quality Control" Article. Revise mockup construction and perform additional tests as required to achieve specified minimum acceptable results.

2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Spiral oval and round ducts:

1. United Sheet Metal Division, United McGill.
2. Semco Manufacturing, Inc.
3. Eastern Sheetmetal.
4. Lindab, Inc.
5. Or equal.

C. Duct Connection Systems:

1. Ductmate Industries, Inc.
2. Fabriduct Transverse Duct Connection system.
3. Ward Industries, Inc.
4. Or equal.

D. Flexible Connections:

1. Ventfabrics.
2. Duro Dyne.
3. Or equal.

E. Flexible Ducts:

1. Thermaflex.
2. Hart & Cooley.
3. Flexmaster.
4. Or equal.

F. Duct Sealants:

1. Foster Products Corporation.
2. Hardcast Corporation.
3. 3M.
4. Or equal.

G. Flexible Duct Clamps:

1. Panduit.
2. Dura-Dyne.
3. Young Regulator Company.
4. Or equal.

H. Hi-Efficiency Branch Take-Off Fittings:

1. Flexmaster.
2. Crown.
3. Sheet Metal Connectors.
4. Or equal.

I. Flues:

1. Metal-Fab, Inc..
2. American Metal Products Amerivent.
3. Simpson Dura-Vent.
4. Or equal.

2.2 MATERIALS

A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Steel Sheet Metal:

1. Cold rolled soft steel sheets.
2. ASTM A653 and A924.
3. Galvanizing: 1-1/4 ounces per square foot, total both sides.

    a. General: G-90.

b. Exposed to weather: G-90.
c. Plenum walls and blank-offs where in contact with cooling coil: G-90.

4. Lock-forming quality.

C. Stainless Steel Sheet Metal:

1. ASTM A480.
2. Type 304 unless otherwise specified herein.
3. Lock-forming quality.
4. Finish:

a. No. 3 or 4 finish on ducts exposed to occupant view.
b. No. 2B or 3 finish on concealed ducts.

D. Miscellaneous Products.

1. Screws and rivets:

a. Same material as sheet, except as indicated on the Drawings.
b. On aluminum sheets, provide cadmium plated or stainless steel.
c. Zinc or cadmium plated, permitted on galvanized sheets.
d. Minimum screw size: No. 10.
e. Minimum rivet size: 4 pound.

2. Duct Sealants:

a. Sealing compound: UL-181 listed, water based:

1) Foster Safetee Duct Sealant 32-19.
2) Childers CP-146.
3) Hardcast Products Group Flex-Grip 550.
4) Or equal.

b. Rolled Elastomeric Duct Sealant: Hardcast Products Group Foil Grip 1403-181BFX, or equal, UL 181 listed.
c. Gaskets:

1) Continuous, reinforced, inert self-conforming type.
2) 1/8 inch thick.
3) Width: to match angle connection..
4) 3M Weatherban Ribbon Sealant PF5422 or equal.

d. Two-Part Hard-Setting Joint Tape:

1) Two part process includes tape and hard setting sealant.
2) Mineral impregnated woven fiber tape.
3) Impregnated with activator/adhesive of polyvinyl acetate type.
4) UL Listed.
5) Flame spread: 10.
6) Smoke contributed: 0.
7) Equal to Hardcast RTA-50 sealant and DT-5400 4 inch tape.

3. Spring Fasteners:

a. Oval head stud and receptacle.
b. Screwdriver slot.
c. Self-ejecting.
d. Dzus or equal.

4. Angles, tie rod and shapes for reinforcing ducts: In accordance with SMACNA HVAC Duct Construction Standards, except as indicated on the Drawings.
5. Duct connection system:

a. Transverse bolted duct joints.
b. Flanges with permanent, non-hardening sealant.
c. Ductmate Industries Ductmate 25 and 35, Fabriduct TDC, or equal.

E. Flexible Connections:

1. Conforming to UL Standard No. 214 and NFPA 90A.
2. SMACNA HVAC Duct Construction Standards, except as indicated on the Drawings.
3. With metal edges at each end: No. 24 USSG galvanized steel.
4. Length of fabric connections.

a. Minimum: 4 inch.
b. Maximum: 10 inch.

5. Materials:

a. Coated glass fabric.
b. Flame spread rating: 25.
c. Smoke development rating: 50.
d. 30 ounces per square yard.
e. Sewed and cemented seams.
f. Indoors:

1) Neoprene.
2) Ventfabrics, Inc. Ventglas or equal.

g. Outdoors:

1) Weather-resistant.
2) Fiberglass with Hypalon.
3) UV, sunlight, and ozone resistant.
4) Ventfabrics, Inc. Ventlon or equal.

h. Fume Hood:

1) Fabric coated with Teflon fluorocarbon resins.
2) Meets UL Standard #214 for flammability and NFPA 102 requirements.
3) Ventfabrics, Inc. Ventel or equal.

F. Turning Vanes:

1. Galvanized steel ductwork: galvanized steel or painted black steel, except as indicated on the Drawings.
2. Other ductwork: same material as ductwork.
3. Construction per SMACNA HVAC Duct Construction Standards for:

a. Double wall vanes.
b. Vane length: Provide separate equal size sections for vane length greater than those indicated in referenced Standards.
c. Vane runners: Type 1 or 2 acceptable.

4. Vane radius:

a. 2 inch radius: duct width up to 36 inches.
b. 4-1/2 inch radius: duct with 36 inches or larger.

5. Vane shall be at the correct angle for airflow (leading edge in line with the entering duct section; leaving edge in line with existing duct section). If only 45° angles are available, turning vanes shall only be used in 90° elbows where the entering width equals the exiting width; all other elbows shall be full radius type unless otherwise indicated on the drawings.

G. Hi-Efficiency Branch Take-Off Fittings: Low-pressure round take-off fittings in rectangular duct:

1. Factory-fabricated hi-efficiency take-off fitting.
2. 26 gauge body, G90 galvanized steel.
3. 1” wide mounting flange with fully closed corners and pre-punched screw holes, adhesive coated gasket on flange.
4. Balancing damper:

a. 20 gauge blade.
b. G90 galvanized steel 3/8 inch square control shaft.
c. Nylon shaft bearings/bushings.
d. 2” high insulation stand-off.
e. Duro Dyne KR-3 Locking hand quadrant or equal.

5. No scoop allowed for any application.
6. Flexmaster STOD or equal.

2.3 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS

A. General: Fabricate ducts, elbows, transitions, offsets, branch connections, and other construction with galvanized sheet metal, according to SMACNA’s “HVAC Duct Construction Standards – Metal and Flexible.” Comply with requirements for metal thickness, reinforcing types and intervals, tie-rod applications, and joint types and intervals.

1. Lengths: Fabricate rectangular ducts in lengths appropriate to reinforcement and rigidity class required for pressure classification.
2. Materials: free from visual imperfections such as pitting, seam marks, roller marks, stains, and discolorations.

B. Cross Breaking or Cross Beading: Cross break or cross bead duct sides 19 inches and larger and 0.0359 inches thick or less, with more than 10 square feet of unbraced panel area, unless ducts are lined.

C. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-1, "Rectangular Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

D. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

E. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.4 SINGLE-WALL ROUND AND FLAT-OVAL DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.

B. Flat-Oval Ducts: Indicated dimensions are the duct width (major dimension) and diameter of the round sides connecting the flat portions of the duct (minor dimension).

C. Factory-fabricated spiral lock seam duct:

1. Snap-lock is not acceptable.
2. Factory-fabricated longitudinal seam acceptable for ducts larger than standard factory sizes.
3. Ducts up to 20 Inches in Diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
4. Ducts 21 to 72 Inches in Diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
5. Ducts larger than 72 Inches in Diameter: Companion angle flanged joints per SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," Fig. 3-2.
6. Round Ducts: Prefabricated connection system consisting of double-lipped, EPDM rubber gasket. Manufacture ducts according to connection system manufacturer's tolerances.
7. Flat Oval Ducts: Prefabricated connection system consisting of two flanges and one synthetic rubber gasket.

D. Fittings:

1. Same material and construction as duct in which installed.
2. For ductwork exposed to occupant view, do not use fabricated fitting at taps to VAV boxes and outlets. Instead use saddle tap cut into continuous spiral duct. Intent is for spiral duct to be continuous for aesthetic reasons. Saddle tap flange shall be 0.5 inches or less.
3. 90 degree tees, laterals, and conical tees:

    a. Fabricate to comply with SMACNA’s “HVAC Duct Construction Standards – Metal and Flexible”, with metal thicknesses specified for longitudinal-seam straight ducts.
    b. Center-line take-off, unless otherwise indicated on the Drawings.

4. Elbows:

    a. Seams:

        1) 4 inch and higher pressure class and all ducts exposed to occupant view: continuously welded seams.
        2) 1 inch to 3 inch pressure: spot welded with bonded (sealed) seams.

b. Gores:

1) 2 gores - less than or equal to 30 degrees.
2) 3 gores - 31 degrees through 45 degrees.
3) 4 gores – 46 degrees through 60 degrees.
4) 5 gores - over 61 degrees

2.5 DOUBLE-WALL ROUND AND FLAT-OVAL DUCTS AND FITTINGS

A. Flat-Oval Ducts: Indicated dimensions are the duct width (major dimension) and diameter of the round sides connecting the flat portions of the duct (minor dimension) of the inner duct.

B. Round, Longitudinal- and Spiral Lock-Seam Ducts: Fabricate supply ducts of galvanized steel according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible." Ducts to have a perforated inner liner, a 1-inch layer of fiberglass insulation (1-1/2 pounds per cubic foot density) and an outer pressure cell.

C. Outer Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on static-pressure class unless otherwise indicated.

D. Inner Duct: Minimum 0.028-inch perforated galvanized sheet steel having 3/32-inch-diameter perforations, with overall open area of 23 percent.

E. Duct Joints:

1. Ducts up to 20 Inches in Diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
2. Ducts 21 to 72 Inches in Diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
3. Ducts larger than 72 Inches in Diameter: Companion angle flanged joints per SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," Fig. 3-2.
4. Round Ducts: Prefabricated connection system consisting of double-lipped, EPDM rubber gasket. Manufacture ducts according to connection system manufacturer's tolerances.
5. Flat Oval Ducts: Prefabricated connection system consisting of two flanges and one synthetic rubber gasket.

F. 90-Degree Tees and Laterals and Conical Tees: Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," with metal thicknesses specified for longitudinal-seam straight ducts.

G. Diverging-Flow Fittings: Fabricate with reduced entrance to branch taps and with no excess material projecting from fitting onto branch tap entrance.

H. Fabricate elbows using die-formed, gored, pleated, or mitered construction. Unless elbow construction type is indicated, fabricate elbows as follows:

1. Mitered-Elbow Radius and Number of Pieces: Welded construction complying with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible."
2. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from minus 2- to plus 2-inch wg:
3. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from 2- to 10-inch wg:

4. Flat Oval Mitered Elbows: Welded construction with same metal thickness as longitudinal-seal flat oval duct.
5. Round Elbows 8 Inches and Less in Diameter: Fabricate die-formed elbows for 45- and 90-degree elbows and pleated elbows for 30, 45, 60, and 90 degrees only. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
6. Round Elbows 9 through 14 Inches in Diameter: Fabricate gored or pleated elbows for 30, 45, 60, and 90 degrees unless space restrictions require mitered elbows. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
7. Round Elbows Larger Than 14 Inches in Diameter and All Flat-Oval Elbows: Fabricate gored elbows unless space restrictions require mitered elbows.
8. Die-Formed Elbows for Sizes through 8 Inches in Diameter and All Pressures 0.040 inch thick with 2-piece welded construction.
9. Round Gored-Elbow Metal Thickness: Same as non-elbow fittings specified above.

I. Interstitial Insulation: Fibrous-glass liner complying with ASTM C 1071, NFPA 90A, or NFPA 90B; and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."

1. Maximum Thermal Conductivity: 0.27 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.
2. Install spacers that position the inner duct at uniform distance from outer duct without compressing insulation.
3. Coat insulation with antimicrobial coating.
4. Cover insulation with polyester film complying with UL 181, Class 1.

2.6 FLEXIBLE DUCTS

A. General Requirements:

1. Flexible ducts shall be used for supply air ducts only (not acceptable for return, exhaust, relief, outdoor, etc. air ducts).
2. UL 181, Class I Air Duct.
3. Labeled for compliance with IMC.
4. Minimum working pressure:

   a. 0 to 4 inch positive static pressure class: 4 inches.
   b. 0 to 1 inch negative static pressure class: 1 inch.

5. Acoustic Performance:

   a. Regenerative noise due to air turbulence within the duct shall not exceed the following sound power levels for a 12 inch diameter duct with an air speed of 1,000 feet per minute.

	Sound Power Levels, dB re. 10^{-12} Watts, at Octave Band Center Frequency, Hz				
	125	*250*	*500*	*1000*	*2000*
Maximum Regenerative Noise	*30*	*31*	*30*	*22*	*20*

6. Insulated Flexible Duct:

a. Chlorinated polyethylene (CPE) inner liner duct permanently bonded to a vinyl or zinc coated spring steel wire helix.
b. Fiberglass insulating blanket; minimum R-value:

1) Ducts outside the conditioned space and in conditioned envelope: 4.2.
2) Ducts outside conditioned space and conditioned envelope: 8.0.

c. Low permeability outer vapor barrier of fiberglass bi-directional reinforced metallized film laminate.
d. Flexmaster Type 8M or equal.

B. Flexible ductwork clamps:

1. Straps listed for use with flexible ductwork.
2. 2 inches and greater SP Class: Galvanized-steel strap with cadmium-plated hex screw to tighten band with a worm-gear action.

a. Adjustable toggle type.
b. Dura-Dyne Dyna Clamps or equal.

3. Less than 2 inches SP Class: Adjustable nylon strap.

a. With factory furnished installed tool.
b. Panduit PAN-TY Cable Ties, Heat Stabilized Nylon 6/6 or equal.

2.7 FLUES

A. Category IV appliances:

1. Positive pressure, double wall, factory-built, UL 1738 listed for Category IV appliances burning natural gas.
2. The vent shall have an inner gas carrying pipe of AL-29-4C superferritic stainless steel. The outer jacket shall be 430 stainless steel. The space between the inner and outer pipe, the thickness of materials, and construction of the modular sections and accessories shall be as specified by the terms of the product's UL Listing.
3. The stack system shall be from one manufacturer and shall be complete with caps, supports, and bracing.
4. Where exposed to weather, the outer closure band shall be sealed to prevent rainwater from entering the space between inner and outer walls.
5. Metal-Fab Model CG, Selkirt Saf-T Vent CI Plus, or equal.

2.8 HANGERS AND SUPPORTS

A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.

B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.

C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."

D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.

E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A 492.

F. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

H. Trapeze and Riser Supports:

1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.
3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Ductwork Installation – General:

1. Install ducts in accordance with manufacturer's written installation instructions.
2. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.
3. Construct with gages, joints, bracing, reinforcing, and other details per latest IMC, ASHRAE, SMACNA and NFPA, unless specified otherwise.

    a. Comply with most stringent.
    b. Provide ducts with IMC gages or thicker when traversing rated corridors.
    c. Combustion air ducts: Minimum 24 gage.

4. Construct of galvanized sheet metal, except where otherwise indicated herein or on Drawings.
5. Provide for duct rigidity by either of these methods:

    a. Beading at 12 inches on center, maximum.
    b. Crossbreak outward in ducts having positive internal pressure.
    c. Crossbreak inward in ducts having negative internal pressure.

        1) Exception: All ducts exposed to rain shall outward crossbreak on top of the duct.

6. Duct dimensions indicated are outside duct dimensions (OD) unless indicated on the Drawings as inside dimension (ID or net, clear dimension).
7. Alter duct sizes on basis of equal friction where required to facilitate installation. Reflect changes in shop drawings for review by Architect.
8. At duct penetrations of walls, floors and ceilings where exposed to occupant view, provide sheet metal angle type escutcheons with no sharp corners or edges.

a. Clearance from duct to opening shall not exceed 2 inches.
b. Escutcheons shall overlap wall, floor, or ceiling surface by ½ inch minimum.

9. Frame, trim, caulk and seal all duct penetrations through acoustical walls and partitions.
10. Tapers:

a. Pitch sides of duct in diverging or converging airflow maximum of 1 to 4 taper.
b. Abrupt, bushing type fitting not allowed.

11. Duct Openings:

a. Provide openings where required to accommodate thermometers, smoke detectors, controllers, and the like. Insert through airtight rubber grommets.
b. Where openings are provided in insulated ductwork for insertion of instruments, install insulation material inside metal ring for use as plug.
c. At fire dampers allow adequate length of duct to install access door.

12. Avoid penetration of ducts; provide airtight seal at unavoidable penetrations of hanger rods.
13. No exposed sharp metal allowed.

a. All exposed pins, screws and sharp objects shall be covered with hardening silicon.
b. All exposed sheet metal edges shall be hemmed with exposed corners rounded smooth.
c. Remove all sheet metal fish hooks.

14. Install lining in ducts and plenums as specified in Section 230700 – Mechanical Insulation.
15. Flexible Connections:

a. Coated glass fabric.
b. For indoor or outdoor use.
c. Use diaphragm type at plug fan inlets.
d. Install at connections to fans and air handling units and as indicated on Drawings.
e. 2 inch slack in fabric; install to allow minimum movement of 1 inch in both tension and compression.
f. Protect from direct solar and rain exposure with sheet metal shroud where outdoors.

16. Volume dampers: Install dampers as specified in Section 233300 – Duct Accessories

C. Elbows and Splits:

1. Use radius elbows in rectangular ducts unless otherwise indicated on the Drawings: Centerline radius dimension shall not be less than 1-1/2 duct width.
2. Where space does not permit duct radius specified above install short radius splitter vanes per SMACNA HVAC Duct Construction Standard.

a. Number of vanes determined by ratio of inner radius (R) to duct width in plane of radius (W).
b. One vane: Radius to width ratio above 0.3.
c. Two vanes: Radius to width ratio between 0.1 to 0.3
d. Three vanes: Radius to width ratio 0.1 and smaller.

3. Use square turns with turning vanes in rectangular ductwork, unless otherwise indicated on the Drawings, at following locations.

a. Use only where full radius elbow cannot fit.

b. Use only in ducts with 2000 fpm or less design velocity.
c. In high and medium pressure ductwork spot weld turning vane to duct.

D. Rectangular Duct Joints:

1. Transverse Joints:

a. In medium pressure ductwork shall be Fabriduct TDC or Ductmate or equal.
b. In low pressure ductwork shall be Fabriduct TDC or equal except that ducts under 19 inches longest side may be slip & drive (S&D)

2. Longitudinal seams shall be Pittsburgh. Snap lock not allowed.

E. Plenum walls, blank-offs, and casings:

1. Construct per SMACNA HVAC Duct Construction Standard, Casings and Plenums.
2. Static pressure class:

a. Upstream of fan: -2 inches.
b. Downstream of fan: fan static pressure or greater.

3. Seal all joints, edges, and penetrations as per HVAC ducts as specified herein.

F. Round and oval ductwork:

1. Joints between ducts:

a. Made with beaded sleeve joints as scheduled.
b. Duct sealer applied to male end.
c. Mechanically fastened with sheet metal screws or pop rivets.
d. Over joint and screw or rivet heads, apply coating of duct sealer.

1) Duct where exposed to occupant view: Sealant shall be within joint only and not visible.

2. Joints, duct and fitting:

a. Slip projecting collar of fittings into duct: Per SMACNA HVAC Duct Construction Standard.
b. Apply duct sealer: Seal and tape as specified above.
c. Mechanically fasten: Fastening schedule: Per SMACNA HVAC Duct Construction Standard.

3. Branch take-offs:

a. Medium pressure: 45 degrees (fittings).
b. Low pressure: straight 90 degrees (fittings).

4. Horizontal supports:

a. One or two piece clamp band strap.
b. Minimum: one per section.
c. Support fittings as required to prevent sagging.

5. Vertical Supports: one of the following:

    a. Clamp bands with extended ends supported by floor.
    b. Clamp bands with knee bracing.
    c. Pedestal at base of vertical.

G. Flexible ductwork:

1. Not allowed for:

    a. Return, exhaust, or outdoor air ducts.
    b. Product conveying systems such as kitchen exhaust and laboratory exhaust.
    c. Dryer exhaust (other than final exposed connection at dryer).
    d. Medium and high pressure ducts.

2. Continuous, single pieces:
3. Length:

    a. Low pressure:

        1) Maximum 5 feet, except where longer lengths are indicated on drawings. Where longer lengths are shown, the last 3 feet to 5 feet shall be wire flex duct and remaining ductwork shall be aluminum flex duct.
        2) Minimum length: 3 feet.

4. End connections:

    a. Connect to duct collars, terminal unit connections and round air outlets per manufacturer's instructions.
    b. Secure with strap clamps specified above.

5. Installations:

    a. Support adequately to avoid excessive droop.
    b. Minimum inside bending radius not less than one duct diameter.
    c. Install as straight as possible except as shown on drawings for sound attenuation.
    d. Cut ducts to lengths required rather than create bends to take up excess lengths except as shown on drawings for sound attenuation.

H. Grille connections:

1. Provide at entry to diffuser collar either.

    a. Straight duct for 1 duct diameters or greater.
    b. Full radius elbow.
    c. Side inlet plenum.

        1) Height: 4 inches minimum taller than top of grille to provide room for uniform airflow to grille.
        2) Width/length: 2 inches wider than duct or round diffuser collar, whichever is larger.
        3) Internal surfaces lined with minimum 1/2 inch thick Type AL duct liner as specified under Section 23 07 00 – Mechanical Insulation.

4) At contractor's option, where plenum is required at round neck diffuser, square neck diffuser with length and width equal to diffuser diameter may be substituted.

d. Thermaflex FlexFlow Elbow or equal.

2. Connections at grilles shall be insulated to the extent the duct is insulated including the final register box.
3. Seal connections at grilles per seal class of upstream ductwork.

I. Ducts exposed to weather:

1. Galvanized steel G-90, 304 stainless steel, or aluminum.
2. Make ducts subject to rain watertight.
3. Construct as follows to assure water run-off.

a. Arrange standing seams to not act as dams.
b. Longitudinal seams at bottom of duct.
c. Construct all ducts subject to rain watertight and to insure water runoff by one or more of following techniques.

1) Slope entire top of duct down toward side..
2) Vertical struts within duct to bow top panels of duct into convex shape.

4. Seal as specified herein.

J. Sound-rated duct packing:

1. Wherever possible avoid duct penetrations through sound-rated walls, floors and ceilings.
2. Provide packing for unavoidable duct penetrations.

3.2 INSTALLATION OF EXPOSED DUCTWORK

A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.

B. Ductwork exposed to occupant view shall be run straight and true, in line with building elements. No sagging or out-of-true straight runs shall be acceptable. Sidewall taps and duct joints shall be clean and free of visual blemishes and all sealant shall be internal to joint and not visible. Ducts shall have no external markings or tags. All duct beads shall be parallel.

C. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.

D. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.

E. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.

F. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.3 DUCT CLASSIFICATION

A. Minimum operating pressure for each duct system, general.

B. Static pressure class, unless otherwise indicated on the Drawings.

Application	SMACNA Pressure Class
Discharge of air handlers through shaft fire/smoke damper	4 inches
Air distribution duct from fire/smoke damper to VAV terminal boxes	3 inches
VAV downstream of terminal boxes	1 inch
Discharge of air handler though air distribution devices (for constant volume systems)	2 inches
Toilet exhaust	-2 inches
Return	-2 inches
Other fans systems	Per fan static
Return air transfers	1 inch negative

3.4 DUCT SEALING

A. Seal ducts per the Seal Level table below:

1. Seal factory fabricated ducts and plenums, including terminal boxes, if not factory sealed to Seal Level listed.
2. Provide more stringent sealing if required to meet other requirements herein.

Seal Level Requirement					
Duct Location	Duct Type				
	Supply		Exhaust	Return	Outdoor
	≤2 in. water column[b]	>2 in. water column[b]			
Outdoors	A	A	A	A	A
Unconditioned Spaces	A	A	A	A	A
Return Air Plenums	A	A	A	A	A
Conditioned Spaces	A	A	A	A	A
[b] Duct design static pressure classification.					

Seal Level Definitions	
Seal Level	Sealing Requirements
A	All transverse joints, longitudinal seams, and duct wall penetrations
B	All transverse joints and longitudinal seams
C	Transverse joints only

Longitudinal seams are joints oriented in the direction of airflow. Transverse joints are connections of two duct sections oriented perpendicular to airflow. Duct wall penetrations are openings made by any screw fastener, pipe, rod or wire. Spiral lock seams in round and flat oval duct need not be sealed. All other connections are considered transverse joints, including but not limited to taps and other branch connections, access door frames and jambs, duct connections to equipment, etc.

B. Ducts not exposed to weather: Seal using one of the following:

1. Duct sealer compound.
2. Gasketted TDC or Duct-Mate.
3. Two-Part Hard-Setting Joint Tape.
4. Flexible duct:

    a. Secure with straps or clamps as specified herein.
    b. Supplement with duct tape, both inner and outer liner.

5. Indoor duct where exposed to occupant view: Sealant shall be within joint only and not visible.
6. Fire and fire/smoke dampers: Sealant shall be listed as approved on manufacturer's UL installation sheet.
7. Continuously welded ducts: Additional sealing not required.

C. Duct exposed to weather:

1. TDC or Duct-Mate joints: Utilize interior joint gasket material plus a bead of butyl rubber sealant at the joint and continuous metal clip or cleat over the top of all four joints (top bottom and sides).

2. Continuously welded ducts: Additional sealing not required.
3. Other joints: Apply two part hard-setting joint tape to:

    a. Longitudinal joints.
    b. Horizontal joints.
    c. Transverse joints.
    d. TDC or Duct-Mate joints.
    e. Duct penetrations.
    f. Screws through duct.
    g. Gores of elbows.

D. Seal punched holes and corner cracks.

E. Seal all factory fabricated ducts, including transverse joints on gored elbows.

F. Seal end caps.

G. After installation and testing reseal joints found to be leaking at no additional cost to the Owner.

3.5 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.

1. Where practical, install concrete inserts before placing concrete.
2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.

C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.

D. Hangers Exposed to View: Threaded rod and angle or channel supports.

E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet.

F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.6 FLUE INSTALLATION

A. Install in accordance with manufacturer’s installation instructions and UL listing requirements and with local codes.

B. Category 1 Appliances: Minimum stack height shall be in accordance with GAMA Venting Tables for Category I Appliances and IMC.

C. Support from building structure using rigid structural shapes for attachment of fixed point supports. Anchor supports to structure by welding, bolting, steel expansion anchors, or concrete inserts. Size of structural shapes shall be in accordance with manufacturer’s recommendations.

D. Roof penetration pieces shall be UL listed products of the chimney manufacturer. Where roof is pitched up to 45° roof penetration pieces shall be of the pitched type so that it is not necessary to provide a horizontal roof curb. If roof pitch exceeds 45°, provide a curb around roof opening.

E. All inner pipe joints shall be held together by means of formed vee bands and sealed with P077 Silicone Sealant for flue gas temperature up to 600°F, or P071 High Temperature Sealant for flue gas temperatures over 600°F.

F. Screws shall be of the hex head type with shoulder stops and tapered leading threads for easy starting. Nuts for the inner and outer bands shall be retained by means of a free-floating cage to allow easy alignment.

G. Where exposed to weather:

1. The outer closure band shall be sealed with the same sealant as the inner joint.
2. Paint with one coat of corrosion and heat resistant primer and cone coat heat resistant paint. Paint color selected by Architect.

H. Termination:

1. Roof termination: Terminate with listed wind resistant flue cap 3 feet above the highest point where it pass through a roof and at least 2 feet higher than any portion of the building within a horizontal distance of 10 feet.
2. Wall termination: Terminate with listed 45° miter cut with bird screen unless otherwise indicated on plans.

3.7 CONNECTIONS

A. Make connections to equipment with flexible connectors complying with Section 233300 "Air Duct Accessories."

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.8 PAINTING

A. Paint interior of metal ducts that are visible through registers and grilles and that do not have duct liner. Apply one coat of flat, black, latex paint over a compatible galvanized-steel primer.

3.9 DUCT PRESSURE TESTING

A. Leakage Tests:

1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
2. Test the following systems:

    a. Supply, Return, Exhaust, and Outdoor Air Ducts: Test 100% of installed duct sections.
    b. Field installed plenums. Test 100% of all field installed plenums.

3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
4. Test for leaks before applying external insulation.
5. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
6. Give seven days' advance notice for testing.

B. General:

1. Pretesting shall be conducted prior to conducting test in presence of Architect. Once all required ductwork has passed the pretest duct pressure test, the Architect shall be notified to visit the site for witness testing.
2. Use portable high pressure blower and necessary instruments to indicate amount of leakage.
3. Conduct tests as prescribed in SMACNA HVAC Air Duct Leakage Test Manual, and make test before duct sections are concealed.
4. Procedure:

    a. Seal openings in ducts and plenums to be tested.
    b. Connect test apparatus to test section using flexible duct connection or hose.
    c. Close damper on blower suction side, to prevent excessive buildup of pressure.
    d. Start blower and gradually open damper on suction side of blower.
    e. Build up pressure in test section equal to static pressure class.
    f. Noise generated from duct leakage not acceptable. Seal as required.
    g. Determine amount of air leakage by makeup air flow measurements:

        1) Maximum permitted leakage for HVAC ductwork shall be:

$$CFM_{max} = \left(\frac{A}{100}\right) C_L P^{0.65}$$

Where,

CFM_{max} = The maximum permitted leakage, cubic feet per minute (cfm).

A= Surface area of the tested duct sections, square feet.

C_L= Duct leakage class, cfm/100 square feet at 1 inch water column.

= 6 for rectangular sheet metal, rectangular fibrous ducts, and round flexible ducts

= 3 for round/flat oval sheet metal or fibrous glass ducts

P= Test pressure which shall be equal to the design duct pressure class rating, inches water column.

2) Allowable leakage can also be calculated as 1 percent of the design operating air volume for the entire system. If this method is used, the total system leakage must first be determined and then compared with the 1 percent (of system volume flow) allowable leakage. Acceptance is indicated if the actual measured leakage of the entire system is less than the calculated allowable leakage.
3) If leakage exceeds permitted limit, repair leaks and retest duct sections at no additional cost to the Owner until permitted leakage limits are obtained.

5. Visually mark tested sections with certification sticker and initials of field test inspector.

C. Documentation:

1. Submit certification of test results of compliance to Architect.
2. Include certified test results showing compliance per Section 230010 – Mechanical General Provisions.

D. Duct system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.10 SYSTEM LEAK TESTING

A. Scope of Testing:

1. Supply: All supply air duct systems.
2. Return: All return air duct systems.
3. Exhaust: Systems greater than 10,000 cfm design capacity.
4. Outdoor air: Not required.

B. General:

1. Tests shall be done after air balancing; see 230593 – Testing, Adjusting and Balancing.

2. Determine the maximum allowable leakage per system using the methodology in described above. The duct surface area shall be all ductwork downstream of the fan through the air outlets.
3. Or, use the 1 percent allowable leakage as described above.

C. Test Conditions:

1. Fan balance complete and operating at design airflow conditions.
2. For variable volume fans, set all the variable volume boxes to design maximum airflow rates and operate the fan at optimum static pressure setpoint; (see 230593 Testing, Adjusting and Balancing); fan and boxes to remain in a static state during the testing.

D. Leakage Testing:

1. Collect the following information from air balance reports for each tested fan system. (This work is already required in Section 230593 Testing, Adjusting and Balancing, so no new work is required.)

   a. Pitot traverse in the supply (exhaust) duct downstream, positive pressure side (downstream, negative pressure side) of the fan, and
   b. Totaling the readings of individual air outlets or terminals

2. Subtract the readings in Paragraph above. If the difference in the readings, accounting for the accuracy of the test instruments, is greater than the amount allowed in Paragraphs above, repair air leaks as required and retest.

E. Documentation:

1. Submit certification of test results of compliance to Architect.
2. Include certified test results showing compliance per Section 230010 – Mechanical General Provisions.

3.11 PROTECTION

A. Adhere to SMACNA Duct Cleanliness for New Construction Guidelines for Intermediate Level Duct Cleanliness unless more stringent requirements are indicated herein.

B. Storage: Porous materials, such as lined and flexible duct, shall be stored where they will not be exposed to rain or other moisture sources.

C. Temporary closure: Provide temporary closure of polyethylene film or other covering which will prevent entrance of dust and debris at the following conditions:

1. Exposed ends of unlined installed ducts at the end of each day.
2. Exposed ends of lined ducts or plenums whether in storage or installed.

D. Duct cleaning:

1. Using the connected fan(s) force air at high velocity through duct to remove accumulated dust.
2. Protect equipment and spaces, which may be harmed by excessive dirt with filters, or bypass during cleaning.

3. In areas, which must be kept dust free, seal all outlets duct tight. When closures are removed avoid spilling dust in room.

3.12 INSPECTION

A. Verify that adequate clearance between ducts and adjacent walls or equipment is available to permit proper sealing, maintenance and repairs.

3.13 PRE-OPERATING CHECKS

A. Before operating the duct systems: Set all manual dampers in full open position.

3.14 TESTING AND ADJUSTING

A. After starting the duct systems: Check for noise and leakage. Repair as required at no additional cost to the Owner.

B. See Section 230593 – Testing, Adjusting, and Balancing: Coordination with Balance Agency:

1. Provide services of a sheet metal installer familiar with the system ductwork to provide assistance to the balancing agency during the initial phases of air balancing in locating all sheet metal dampers.
2. Install missing dampers.

END OF SECTION 23 31 13

SECTION 23 33 00

DUCT ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Access Doors.
2. Balancing Dampers.
3. Backdraft Dampers.
4. Fire dampers.
5. Fire and Smoke Dampers.
6. Wall Louvers.
7. Combination Louvers/dampers.
8. Drain Pans.
9. Belt Guard.
10. Condensate Pumps.
11. All duct accessories except, where integral with manufactured piece of equipment.

1.3 QUALITY ASSURANCE

A. Fire, smoke, and fire/smoke dampers shall be UL listed and constructed in accordance with UL Standard 555 Fire Dampers and UL Standard 555S.

B. Demonstrate operation of smoke dampers to authorities having jurisdiction and Architect as part of life safety testing.

C. Access doors shall be UL labeled.

D. Damper pressure drop and leakage ratings shall be based on tests and procedures performed in accordance with AMCA 500 - Test Methods for Louvers, Dampers and Shutters.

1.4 SUBMITTALS

A. See Section 230010 Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings according to the following table.

1. “R” means required.

2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Access doors	R2			R
Balancing dampers	R2			R
Automatic dampers	R	R		R
Backdraft dampers	R2			R
Fire dampers	R	R		R
Smoke dampers	R	R		R
Fire/Smoke dampers	R	R		R
Wall louvers	R			R
Combination louvers/dampers	R	R		R
Drain pans	R2			R
Condensate pumps	R	R		
Belt guards	R2			

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Access Doors, Ducts.

1. Ventfabrics, Inc.
2. Duo Dyne, Corporation .
3. Ruskin Mfg. Company .
4. PCI Industries – Pottorff .
5. Ductmate .

C. Access Doors, Plenum.

1. Ventfabrics, Inc.
2. Duo Dyne, Corporation.
3. Elgen Manufacturing Company.

D. Balancing and Automatic Dampers.

1. Ruskin Manufacturing Company.
2. Greenheck Fan Corp.
3. PCI Industries - Pottorff
4. Johnson Controls.

E. Backdraft Dampers.

1. Ruskin Manufacturing Company.

2. Greenheck Fan Corp.
3. Air Balance, Inc.
4. American Warming and Ventilating Inc.

F. Damper Hardware.

1. Ventfabrics, Inc.
2. Duo Dyne, Corporation.
3. Young Regulator Company.

G. Fire Dampers and Combination Smoke and Fire Dampers.

1. Ruskin Manufacturing Company.
2. Greenheck Fan Corp.
3. Air Balance Inc.
4. PCI Industries – Pottorff.

H. Wall Louvers and Combination Louver/dampers.

1. Ruskin Manufacturing Company.
2. Greenheck Fan Corp.
3. PCI Industries – Pottorff.

2.2 DUCT ACCESS DOORS

A. In accordance with SMACNA Duct Construction Manuals, except as indicated in the Drawings.

B. Construction:

1. Galvanized steel.
2. Rating same as duct pressure class.
3. Where duct is insulated:

   a. Fiberglass insulation, thickness to match duct insulation installed R-value, see 230700 – Mechanical Insulation.
   b. Double wall.

4. Removable type with safety chain linking door permanently to frame.
5. Positive seal polyethylene gasket.
6. Paired progressive cam-locks, quantity as required for tight, low leakage fit.
7. No tools required for opening and closing.

C. Size:

1. 20 inches x 14 inches unless otherwise indicated in the Drawings.
2. Ducts less than 16 inches: one dimension 20 inches; other dimension 2 inch less than duct width.
3. Larger sizes where required for access.

D. Provide in the following locations:

1. Coils in ducts (including at VAV boxes).

a. Entering and leaving side for cooling coils.
b. Entering side for heating coils.

2. Automatic dampers: linkage side.
3. Smoke dampers.
4. Fire dampers.
5. Smoke detection heads.
6. At the top of each lined duct riser accessible from the fan room floor (for inspection of duct liner).
7. Fan bearings enclosed in ducts.
8. Sprinkler heads in ducts.
9. Motors, actuators or other accessories that require access or service inside ducts.
10. Outdoor air plenums as required to clean plenum from dirt and debris.
11. Where otherwise indicated on the Drawings.

2.3 MANUAL, AUTOMATIC AND BACKDRAFT DAMPERS

A. Manual Dampers:

1. Conform to requirements of SMACNA HVAC Duct Construction Standards.
2. General:

a. Blades of same material as duct where damper is located.
b. Damper Hardware:

1) Ventlok 400 and 4000 series or equal; for low pressure systems 2 inch SMACNA pressure class and less.
2) Ventlok HiVel hardware or equal; for greater than 2 inch SMACNA pressure class.

c. Actuating quadrants typical for single and multi-blade dampers; provide closed bearing on opposite end from quadrant to prevent air leakage: Ventlok No. 609 or equal.
d. Bearing at one end of damper rod: Ventlok No. 609 or equal.
e. Sealed bushings installed at both ends to avoid duct leakage.
f. Accessible quadrant at other end of damper rod.

1) With lever and lock screw: Ventlok No. 635 or equal.
2) Insulated ducts.

a) Quadrants mounted on collar to clear insulation.
b) Ventlok Nos. 637, 638, or 639 or equal.
c) Selection based on insulation thickness.

g. For dampers above non-removable ceilings and without ceiling access panels provide Ventlok No. 677 or equal concealed damper regulator.

1) With paintable cover plate.
2) Required interconnecting hardware.

3. Single blade dampers:

a. Galvanized steel ductwork: galvanized steel, except as indicated in the Drawings.
b. Blade: Two gages heavier than duct gage, or 18 gage, whichever is lighter.

4. Multi-blade dampers.

    a. Low Pressure/Low Velocity Systems (2 inch water column or less static pressure class and 1500 fpm or less face velocity).

        1) Opposed blade damper.
        2) Ruskin Model CD35 or equal.

    b. High Pressure/High Velocity Systems (greater than 2 inch water column static pressure class or greater than 1500 fpm face velocity):

        1) Rectangular.

            a) Opposed blade damper.
            b) Ruskin Model CD60 or equal.

        2) Round and Oval.

            a) Oval: Ruskin Model CDR25 and DO25 or equal.
            b) Round: Up to 20 inch diameter: Ruskin Model MDRS25 or equal.
            c) Round: Larger than 20 inch diameter: Ruskin Model CDRS25 or equal.

B. Automatic Dampers:

1. Actuators: See Section 230913 – EMCS Basic Materials and Control System.
2. Construction:

    a. Return air dampers (AHUs):

        1) Class 2 smoke-rated Ruskin Model SD-36 or equal.
        2) End switches: Provide end switch to indicate fully-closed position.

    b. Blade Action:

        1) Throttling duty: opposed.
        2) Mixing duty: parallel.
        3) Two-position: parallel or opposed.

    c. Bearings: Molded synthetic sleeve, turning in extruded hole in frame.
    d. Seals:

        1) Blade: Inflatable PVC coated fiberglass material or neoprene mechanically attached to blade edge.
        2) Jamb: Flexible metal compression type.

    e. Linkage: concealed in frame. External linkage and jack-shafts will not be accepted.
    f. Axles: Minimum 1/2 inch diameter plated steel, hex-shaped, mechanically attached to blade. Side access for direct-coupled actuator.

3. Finish: Mill galvanized.
4. Damper area: See Drawings for sizes.
5. Low Pressure/Low Velocity Systems (2 inch water column or less static pressure class and 1500 fpm or less face velocity).

a. Integral, heavy-duty factory-installed motorized damper acceptable for exhaust fans unless otherwise scheduled.
b. Ruskin Model CD36 or equal.

6. High Pressure/High Velocity Systems (greater than 2 inch water column static pressure class or greater than 1500 fpm face velocity):

a. Ruskin Model CD60 or equal.

C. Backdraft Dampers:

1. Required locations:

a. Where indicated on the Drawings.
b. In suction or discharge of all exhaust fans as listed in equipment schedule.

1) Integral, heavy-duty factory-installed type acceptable unless otherwise scheduled.

2. General Applications:

a. Construction:

1) Extruded aluminum construction.
2) Extruded vinyl locked into blade edge.
3) Blade ends overlapping frame.

b. Performance:

1) Start to open: .02 inches w.g. or less.
2) Fully open: .05 inches w.g. or less.
3) Leakage for 24 inch wide damper: 25 cfm per ft^2 or less.

c. Ruskin Series CBD4 or equal.

3. High Velocity Applications:

a. Applies to discharge of air handlers and where velocity exceeds 1500 fpm. Damper shall be specifically designed for location at turbulent fan discharge.
b. Frame:

1) Minimum 12 gage galvanized steel channel.
2) Bolt Holes: Both flanges.

c. Blades:

1) Airfoil-shaped with integral structural reinforcing tube running full length of each blade.
2) Material: 7 inches x minimum 0.080 inch Alloy 6063-T5 extruded aluminum.
3) For multiple section dampers, provide galvanized steel or aluminum bracket to link dampers so they operate together.

d. Axles: Minimum 3/4 inch diameter plated steel.
e. Bearings: Bolt-on bearings with re-lube ball bearings.

f. Linkage:

1) 3/16 inch thick x 3/4 inch plated steel tie bar with minimum 16 gage plated steel linkage arms; stainless steel pivot pins.
2) Located out of airstream (side or external linkage).

g. Counterbalance: Located out of airstream.
h. Seals:

1) Blade:

a) Mechanically attach blade seals to blade.
b) Silicone rubber, rated for 300 degrees Fahrenheit.

2) Jamb: Vinyl

i. Ruskin CBS92 or equal.

2.4 FIRE DAMPERS

A. Ratings (test conditions and label) per UL Standard 555.

1. 250 degrees Fahrenheit minimum.
2. 1-1/2 hour fire rating, unless otherwise indicated in the Drawings.
3. Dynamic (closes against air flow).

B. Factory sleeve.

C. Damper.

1. Multi-bladed, equipped with fusible link, spring loaded type.
2. Style:

a. As indicated on the Drawings.
b. Ducted, rectangular duct: Style B (out of airstream).
c. Ducted, round duct: Style A (in airstream) with damper sleeve 2” in each dimension larger than duct; plus cap and collar.
d. Unducted: Style A (in airstream).

D. Fusible Link.

1. UL listed.
2. Fusible links on fire dampers shall be constructed to UL Standard 33 – Fusible Links for Fire Protection Service.
3. Temperature rating: Per code.

E. Type:

1. Rectangular type up to 1000 feet per minute: Ruskin DIBD2 or DIBD10 Style A or equal.
2. Rectangular type 1000 feet per minute and higher: Ruskin DIBD2 or DIBD10 Style B or equal.
3. Circular and oval type: Ruskin DIBD2 Style CR and CO, or DIBD10 Style R and LO or equal.

F. Status end switches:

1. Where indicated on the Drawings.
2. Ruskin SP100 or equal Switch Package.

2.5 COMBINATION SMOKE AND FIRE DAMPERS

A. Fire ratings (test conditions and label) per UL Standard 555.

1. 250 degrees Fahrenheit minimum.
2. 1-1/2 hour fire rating, unless otherwise indicated in the Drawings.

B. Factory sleeve.

C. Damper.

1. Two-position duty: Either parallel blade or opposed blade.
2. Leakage class as scheduled, minimum Class 2, rated per UL 555S.
3. Locate damper in sleeve starting at approximately 3” from end of the sleeve opposite the damper actuator end. (Damper shall be installed with this end protruding 3 inches out from inside surface of wall.)

D. Actuator.

1. 120 volt.
2. Two-position unless otherwise indicated on drawings.
3. Spring return normally closed unless otherwise indicated on drawings.
4. Electronic cut-out at full-open so that actuator creates no noise holding open.
5. Permanently lubricated gears.
6. Direct coupled with steel clamp; aluminum clamp and external linkage not acceptable.

E. Controls.

1. Heat-actuated electric release.
2. Controlled closure to prevent duct and HVAC component damage.
3. Time to drive from full closed to open and or spring from full open to closed shall not exceed the following:

   a. FSD’s: 15 seconds.
   b. All others: 75 seconds.

4. Damper to automatically reopen after a test, smoke detection or power failure condition. In the event of heat activated closure, the damper must be manually reset at the damper.
5. Release temperature: as scheduled on drawings or use the following: 165 ºF. This must be <286 ºF for life safety system or whatever design-fire temperature is for exhaust dampers. Should be about 50°F above normal temperature, not less than 160°F per IBC. In non-life safety buildings, use 165ºF. For life safety bldgs with smoke control, use 250ºF which is more than 50ºF above the design smoke temperature, typically 165ºF.
6. Ruskin EFL or equal.

F. Status end switches.

1. Where indicated on the Drawings.
2. Ruskin SP100 or equal Switch Package.

G. Type.

1. Ruskin Type FSDR25, or equal for round ducts. (UL R5531, CSFM #3230-245:108).
2. Ruskin Type FSD36, or equal for 1800 feet per minute and below. (UL R5531, CSFM #3235-0245:0124).
3. Ruskin Type FSD60 or equal for 1800 feet per minute and above. (UL R5531, CSFM #3235-0245:0126).
4. Alternative Ruskin Type FSD60FA or equal for 1800 feet per minute and above. (UL R5531, CSFM #3230-245:116 respectively).
5. Ruskin Type FSD60M, for short sleeve where needed. (UL R5531, CSFM #3230-245:110).

H. Smoke Detector.

1. Detects presence of smoke in the airstream of ductwork in HVAC systems without a minimum operating velocity including no flow operation.
2. UL Listed.
3. CSFM Listing.
4. Ruskin DSDN, or as provided by Div-26 or equal.

2.6 CONDENSATE PUMP

A. Manufacturer: Little Giant, Diversitech, or equal.

B. Provide where scheduled.

C. Contractor shall verify pumping head requirements.

D. Features:

1. Discharge check valve.
2. 115-volt with grounded plug connection.
3. High level alarm contact.

2.7 BELT GUARDS

A. Fabricated per OSHA and SMACNA Duct Construction Standards.

2.8 WALL LOUVERS & COMBINATION LOUVER/DAMPERS

A. Louvers licensed to bear AMCA Certified Ratings Seal. Ratings based on tests and procedures performed in accordance with AMCA 511 and comply with AMCA Certified Ratings Program. AMCA Certified Ratings Seal applies to air performance and water penetration ratings.

B. Materials.

C. Screen.

D. Gutters: Drain gutter in head frame.

E. Downspouts: Downspouts in jambs to drain water from louver for minimum water cascade from blade to blade.

F. Vertical Supports: Hidden vertical supports to allow continuous line appearance up to 120 inches.

G. Sill: Steeply angled integral sill eliminating areas of standing or trapped moisture where mold or mildew may thrive and effect indoor air quality.

H. Assembly: Factory assemble louver components; mechanically fastened.

I. Blank off panels for unused portions of louvers: 20 gage galvanized sheet metal.

J. Factory Finish:

1. Kynar 500 (70% Kynar Resin) 2-Coat Fluoropolymer Coating or equal, unless otherwise specified on Drawings.

a. Conform to AAMA 2605-98.
b. Apply coating following cleaning and pretreatment.
c. Cleaning: AA-C12C42R1X.
d. Dry louvers before final finish application.
e. Total Dry Film Thickness: Approximately 1.2 mils, when baked at 450 degrees Fahrenheit for 10 minutes.
f. Warranty: Limited 20 year warranty on standard colors.
g. Color: Color as selected by Architect from manufacturer's standard colors.

K. Basis of Design Louvers:

1. Outside air intake: Greenheck EHH-601 or equal. 6-inch deep wind-driven rain louver.
2. Exhaust outlet: Greenheck EHH-601 or equal. 6-inch deep wind-driven rain louver.
3. Combination louver/damper: Greenheck EACA-601 or equal, 6” frame.

2.9 DUCT ACCESSORY HARDWARE

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts.

B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Compliance with ASHRAE/IESNA 90.1-2010 includes Section 6.4.3.3.3 - "Shutoff Damper Controls," restricts the use of backdraft dampers, and requires control dampers for certain applications. Install backdraft dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.

D. Volume dampers.

1. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.

    a. Volume dampers shall be installed as far away from air outlets as functionally reasonable to avoid noise in the occupied space.
    b. Provide also in wyes and branch take-offs to outlets whether indicated on the Drawings or not, except.

        1) To sidewall outlets in exposed ducts (opposed blade dampers in outlets shall be provided).

2. For ductwork exposed to occupant view, volume damper handles shall be on top of duct or otherwise concealed from occupant view.

E. Set dampers to fully open position before testing, adjusting, and balancing.

F. Install test holes at fan inlets and outlets and elsewhere as indicated.

G. Fire and smoke dampers.

1. Provide in ducts and openings as indicated in the Drawings.
2. Provide access door in duct adjacent to each in location where damper may be inspected and internal fusible link or fire-stat may be replaced.
3. Install duct smoke detector provided by Division 26 if required; see Division 26 drawings.
4. Smoke and fire dampers installed in tunnel corridors shall have weight of damper supported from structure above.

H. Control dampers.

1. Field mounted control dampers installed with concealed linkage shaft accessible on side of damper with space for direct-coupled actuator.
2. Actuator installation: See Section 230913 – EMCS Basic Materials and Devices

I. Install belt guards at all exposed belts.

J. Drain pans.

1. See Section 221316 – Sanitary Waste and Vent Piping.
2. Condensate drain pans (including pans on fan-coils, packaged units, and air handlers).

    a. Slope to drain connection to allow complete draining of pan.
    b. Provide condensate pump where scheduled.
    c. Piping from intermediate drain pan to lowest pan.

        1) Pipe to within 1 inch of and discharge into lowest drain pan.

d. Piping from lowest pan drain connection to sewer.

1) Trap height and offset must allow water seal to remain and to allow complete drainage of pan both when fan is operating or not.

e. Field test.

1) Test all drain pans after installation to ensure proper slope and drainage and to prevent conditions of water stagnation that result in microbial growth.
2) Drainage shall be considered acceptable if after covering the entire pan with 1/2 inch water, the pan drains within 3 minutes to leave puddles no more than 2 inch in diameter and no more than 1/8 inch deep.
3) Test with the fan system in operation for pans on the suction side of the fan, and with the fan off for pans on the discharge side of the fan.
4) Document tests: See Section 230010 – Mechanical General Provisions.

3. Auxiliary drain pans.

a. See Section 221316 – Sanitary Waste and Vent Piping.
b. Separate drain from main drain pan.
c. Discharge where water flow is readily observed but not over any material or equipment that may be damaged by water.

K. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:

1. On both sides of duct coils.
2. Upstream from duct filters.
3. At outdoor-air intakes and mixed-air plenums.
4. At drain pans and seals.
5. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.
6. Adjacent to and close enough to fire or smoke dampers, to reset or reinstall fusible links. Access doors for access to fire or smoke dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.
7. At each change in direction and at maximum 50-foot spacing.
8. Upstream from turning vanes.
9. Upstream or downstream from duct silencers.
10. Control devices requiring inspection.
11. Elsewhere as indicated.

L. Install access doors with swing against duct static pressure.

M. Label access doors according to Section 230553 "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.

N. Install duct test holes where required for testing and balancing purposes.

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Operate dampers to verify full range of movement.

2. Inspect locations of access doors and verify that purpose of access door can be performed.
3. Operate fire, smoke, and combination fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed.
4. Inspect turning vanes for proper and secure installation.
5. Operate remote damper operators to verify full range of movement of operator and damper.

3.3 TESTING AND ADJUSTING

A. After starting duct accessories.

1. Check for noise and leakage; repair as required at no additional cost to the Owner.
2. Operation test: Test each piece of equipment to show that it will operate in accordance with requirements.

B. See Section 230593 – Testing, Adjusting, and Balancing

END OF SECTION 23 33 00

SECTION 23 34 23

FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Centrifugal fans.
2. Propeller fans.
3. Centrifugal inline fans.
4. Ceiling exhaust fans.
5. Roof mounted fans.
6. Axial flow fans.
7. All fans except where integral with manufactured piece of equipment.

1.3 REFERENCE STANDARDS

A. ANSI/AFBMA Standard 9 – Load Rating and Fatigue Life for Ball Bearings.

B. AMCA 99 – Standards Handbook.

C. AMCA 210 – Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.

D. AMCA 300 – Reverberant Room Method for Sound Testing of Fans.

E. AMCA 301 – Methods for Calculating Fan Sound.

F. ANSI/AFBMA 11 – Load Ratings and Fatigue Life for Roller Bearings.

G. NFPA 92A – Recommended Practice for Smoke Control Systems.

H. NFPA 92B – Standard for Smoke Management Systems in Malls, Atria, and Large Areas.

I. UL 705 – Standard Power Ventilators.

J. UL 762 – Standard Power Ventilators for Restaurant Exhaust Applications.

1.4 QUALITY ASSURANCE

A. AMCA certified ratings per applicable AMCA standard based on the testing conducted in an independent laboratory.

B. Performance Ratings: Conform to AMCA 210 and bear the AMCA Certified Rating Seal.

C. Sound Ratings: AMCA 301; tested to AMCA 300 and bear the AMCA Certified Sound Rating Seal.

D. Fabrication: Conform to AMCA 99.

E. Conform to AMCA Bulletins regarding construction and testing.

1. Fans shall bear AMCA certified rating seal.

F. Scheduled equipment performance is minimum capacity required.

G. Scheduled electrical capacity shall be considered as maximum available.

H. Classification for Spark Resistant Construction, levels A, B, and C conform to AMCA 99.

1.5 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Fans	R	R		R
Performance curves	R			
Sound Power ratings	R			
Motor ratings and electrical characteristics	R			
Dampers, housings, linkages, and operators	R			
Roof curbs	R			R
Fan speed controllers and other accessories	R	R		

C. Include:

1. Complete graph of fan curves, not just curve for design conditions.
2. Sound power levels:

a. Fans 1 horsepower and larger: dB by octave bands.
b. Fans less than 1 horsepower: sones.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Belts: One set(s) for each belt-driven unit.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

1. Loren Cook.
2. Greenheck.
3. PennBarry.
4. Or equal.

2.2 GENERAL

A. AMCA certification in accordance with ARI Standard 210 and 211, and AMCA Standard 2408 for centrifugal fans.

B. Fans used shall not increase motor size, increase noise level, or increase tip speed by more than 10 percent, or increase inlet air velocity by more than 20 percent, from specified criteria.

C. Performance.

1. See fan schedule on the Drawings.
2. Capacities: minimum as scheduled on the Drawings.
3. Brake horsepower rating: Maximum 10 percent above that scheduled on the Drawings.
4. Fans and drives shall be capable of accommodating static pressure variations of plus or minus 10 percent.
5. Motor horsepower: No larger than that scheduled on the Drawings, or compensate Division 26 contractor for any associated cost to increasing motor size.

D. Wheels.

1. Class as stated per AMCA rating for static pressure.
2. Formed steel or extruded aluminum.
3. Statically and dynamically balanced in its own bearings with a maximum full amplitude shaft deflection at bearings not to exceed 0.001-inch at 1200 RPM.
4. Exposed fan wheels protected by finger proof screen.

E. Shafts.

1. AISI C-1045 hot rolled and accurately turned, ground, and polished.
2. Sized for a critical speed of at least 125% of maximum RPM.

F. Motors.

1. Comply with Section 230513 – Motors and Controllers.
2. Provide electrically commutated motor (ECM) where scheduled.

G. Housing.

1. Bolted and welded construction utilizing corrosion resistant fasteners.
2. Scroll wrapper and scroll side panels shall be a minimum 12 gauge steel.
3. The entire fan housing shall have continuously welded seams.
4. Spun inlet bell and shaped cut-off for centrifugal fans.
5. Weatherproof drive covers at utility sets shall have access doors.

H. Direct Drive.

1. Internal thermally protected motor.
2. Speed controller.

I. Belt Drive.

1. Matched, multiple V-belt.
2. Capacity: minimum 1.5 times motor horsepower.
3. Pulleys:

    a. Cast iron.
    b. Variable pitch diameter.

        1) Except motors with variable speed drives.
        2) Fans up to 7-1/2 hp motor.
        3) Fans from 10 hp to 25 hp, under 1000 rpm.

    c. Fixed pitch diameter.

        1) All motors with variable speed drives.
        2) Fans 10 hp and over 1000 rpm.

    d. Select at mid point of range.
    e. For fans that operate as part of the life safety system, provide a minimum of two belts.

4. Automatic belt tensioner to maintain proper belt tension and provide quick belt removal and replacement, where scheduled.
5. Companion sheaves to maintain belts parallel.
6. Drive guards.

    a. Comply with requirements of State OSHA.
    b. Provide holes in belt guards for tachometer readings.
    c. Indoor Belt Drives: 16 gage expanded metal or wire screen enclosure with 70 percent free area and steel frame.
    d. Outdoor Belt Drives: 16 gage solid galvanized sheet metal with stamped louvers near top and bottom for ventilation.

J. Bearings.

1. Designed and tested specifically for use in air handling applications.
2. Heavy duty regreasable ball or roller type in a cast iron pillow block housing.
3. Bearing shaft mounting mechanism shall be concentric mount, not set screw mount.
4. Grease fittings extended to accessible locations outside housing.

5. Life rating: Minimum 200,000 hours per ABMA Standard 9 or 11 L_{50} rating, at maximum catalog speed.

K. Painting.

1. Electrostatically applied, baked polyester powder coating, minimum 2 mil thick.
2. Paint must exceed 1,000 hour salt spray under ASTM B117 test method.

L. Discharge: As indicated on Drawings.

M. Smoke Control Fans.

1. Fans used for smoke control purposes shall comply with the International Building Code.
2. Belt-drive fans shall have 1.5 times the number of required belts and no less than two belts.
3. Shall operate within their nameplate rating.
4. UL listed power ventilator for Smoke Control Systems.
5. UL listed for 500˚F for 4 hours and 1,000˚F for 15 minutes.

N. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch-thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.

1. Configuration: Built-in cant and mounting flange.
2. Overall Height: 14 inches minimum (Coordinate heights with roof construction).
3. Sound Curb: Curb with sound-absorbing insulation.
4. Pitch Mounting: Manufacture curb for roof slope.
5. Metal Liner: Galvanized steel.
6. Burglar Bars: 1/2-inch- thick steel bars welded in place to form 6-inch squares.
7. Mounting Pedestal: Galvanized steel with removable access panel.
8. Vented Curb: Unlined with louvered vents in vertical sides.

2.3 UTILITY SET FANS

A. Fan Wheels: Single-width, single inlet; welded to cast-iron or cast-steel hub and spun-steel inlet cone, with hub keyed to shaft.

1. Blade Materials: Steel.
2. Blade Type: Backward inclined.
3. Spark-Resistant Construction: AMCA 99, Type B.

B. Accessories:

1. Inlet and Outlet: Flanged.
2. Companion Flanges: Rolled flanges for duct connections of same material as housing.
3. Backdraft Dampers: Gravity actuated with counterweight and interlocking aluminum blades with felt edges in steel frame installed on fan discharge.
4. Access Door: Gasketed door in scroll with latch-type handles.
5. Inlet Screens: Removable wire mesh.
6. Drain Connections: NPS 3/4 threaded coupling drain connection installed at lowest point of housing.
7. Weather Hoods: Weather resistant with stamped vents over motor and drive compartment.
8. Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.

2.4 CENTRIFUGAL ROOF VENTILATORS

A. Housing: Removable, top; square, one-piece, aluminum base with venturi inlet cone.

1. Upblast Units: Provide spun-aluminum discharge baffle to direct discharge air upward, with rain and snow drains and grease collector.
2. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.

B. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.

C. Accessories:

1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
2. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
3. Bird Screens: Removable, 1/2-inch mesh, aluminum or brass wire.
4. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
5. Motorized Dampers: Parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.

2.5 UPBLAST PROPELLER ROOF EXHAUST FANS

A. Wind Band, Fan Housing, and Base: Reinforced and braced galvanized steel, containing galvanized-steel butterfly dampers and rain trough, motor and drive assembly, and fan wheel.

1. Damper Rods: Steel with bronze bearings.
2. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.

B. Fan Wheel: Replaceable, cast-aluminum, airfoil blades fastened to cast-aluminum hub; factory set pitch angle of blades.

2.6 IN-LINE CENTRIFUGAL FANS

A. Housing: Split, spun aluminum with aluminum straightening vanes, inlet and outlet flanges, and support bracket adaptable to floor, side wall, or ceiling mounting.

B. Direct-Drive Units: Motor mounted in airstream, factory wired to disconnect switch located on outside of fan housing; with wheel, inlet cone, and motor on swing-out service door.

C. Belt-Driven Units: Motor mounted on adjustable base, with adjustable sheaves, enclosure around belts within fan housing, and lubricating tubes from fan bearings extended to outside of fan housing.

D. Fan Wheels: Aluminum, airfoil blades welded to aluminum hub.

E. Accessories:

1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
2. Volume-Control Damper: Manually operated with quadrant lock, located in fan outlet.
3. Companion Flanges: For inlet and outlet duct connections.

4. Fan Guards: 1/2- by 1-inch mesh of galvanized steel in removable frame. Provide guard for inlet or outlet for units not connected to ductwork.
5. Motor and Drive Cover (Belt Guard): Epoxy-coated steel.

2.7 LABORATORY EXHAUST FANS

A. UL 705, Power Ventilators listed.

B. Direct-drive or belt-drive as indicated on drawings.

C. Housing corrosion resistant coating:

1. The first powder coat applied over the prepared surface shall be a zinc rich epoxy primer (no less than 70% zinc) and heated to a gelatinous consistency (partial cure) at which the second powder coat of polyester resin shall be electrostatically applied and simultaneously be cured at a uniform temperature of 400°F.
2. The coating system, a total thickness of up to 6 mils, is not affected by the UV component of sunlight (does not chalk), and has superior corrosion resistance to acid, alkali, and solvents. Coating system shall exceed 4000 hour ASTM B117 Salt Spray Resistance.

D. Housing construction:

1. Fan housing shall be bifurcated, allowing all drive components, including the motor, to be serviced without contact of the contaminated airstream. Must be manufactured of welded steel and meet specification section 2.15 for corrosion resistant coating. No uncoated metal fan parts will be acceptable.
2. Fan housings that are fabricated of polypropylene or fiberglass that have lower mechanical properties than steel, have rough interior surfaces in which corrosive, hazardous compounds can collect, and / or which chalk and structurally degrade due to the UV component of the sunlight shall not be acceptable.
3. A high velocity discharge nozzle shall be supplied by the fan manufacturer designed to efficiently handle an outlet velocity of up to 7000 FPM. Discharge stack caps or hinged covers, impeding exhaust flow shall not be permitted.
4. An integral fan housing drain shall be used to drain rainwater when the fan is de-energized.
5. A bolted & gasketed access door shall be supplied for impeller inspection and service.
6. Fan assembly shall be AMCA type C spark resistant construction minimum or as noted on the schedule.

E. Fan Wheel:

1. Fan impeller shall be mixed flow design with non-stall characteristics. The impeller shall be electronically balanced both statically and dynamically exceeding AMCA Standards.
2. Fan impeller shall be manufactured of welded and coated steel.
3. Vacuum Seal: Fan impeller shall include a secondary fan blade located on the impeller back plate. This secondary impeller shall create a negative pressure at the shaft opening; preventing hazardous or toxic exhaust fumes from escaping through the housing shaft opening. Mechanical shaft seals that wear out and need to be replaced or seal systems that use hoses or tubes that can leak, are not acceptable.

F. Bypass air plenum:

1. A bypass air plenum shall be provided as shown on drawings. The plenum shall be provided with bypass air damper(s) for introducing outside air at roof level upstream of the fan, complete with bypass air weatherhood and bird screen.

2. The plenum shall be constructed of welded and coated steel and meet specification section 2.15 for corrosion resistant coating. Plenums that are fabricated of plastics or resins that are combustible and have mechanical properties less than steel shall not be acceptable.
3. The bypass air plenum shall be mounted on factory fabricated roof curb provided by the fan manufacturer.
4. Bypass air damper(s) shall be opposed-blade design for airflow control, airfoil design, fabricated of steel for structural rigidity as standard. Bypass damper(s) shall have plated steel damper rods, stainless steel sleeved bearings, 301 stainless steel jamb seals and the blades shall have polymer edge seals. Damper model shall be equal to or exceed a heavy duty control damper. Damper blade drive linkage shall be set by manufacturer and welded to eliminate linkage slippage. All damper access and service (drive actuators) shall be performed outside of the contaminated airstream.
5. Fan isolation damper(s), shall be parallel-blade design, airfoil design, fabricated of steel for structural rigidity as standard. Damper(s) shall be coated up to 4 mils of chemically resistant Hi-Pro Polyester resin, electrostatically applied and baked. Isolation damper(s) shall have plated steel damper rods stainless steel sleeved bearings, 301 stainless steel jamb seals and the blades shall have polymer edge seals. Damper model shall be equal to or exceed a heavy duty control damper. Damper blade drive linkage shall be set by manufacturer and welded to eliminate linkage slippage. All damper access and service (drive actuators) shall be performed outside of the contaminated airstream.
6. Isolation damper actuator(s), shall be wired to a step-down transformer. Actuator and transformer are located in a weatherproof enclosure.
7. Blower / Plenum vibration isolation shall be limited to neoprene / cork vibration pads.

G. Fan Motors and Drives.

1. Motors shall be premium efficiency, standard NEMA frame, 1800 or 3600 RPM, Totally Enclosed Fan Cooled (TEFC) Explosion Proof with a 1.15 service factor. A factory-mounted NEMA 3R disconnect switch shall be provided for each fan. Motor maintenance shall be accomplished without fan impeller removal or requiring maintenance personnel to access the contaminated exhaust components.
2. Drive belts and sheaves shall be sized for 200% of the motor horsepower, and shall be readily and easily accessible for service. Drive shall consist of a minimum of two belts under all circumstances.
3. Fan shaft to be turned and polished of 316 stainless steel as standard, coated with corrosion resistant coating.
4. Fan shaft bearings shall be Air Handling Quality, ball or roller pillow block type and be sized for an L-10 life of no less than 100,000 hours. Bearings shall be fixed to the fan shaft using concentric mounting locking collars, which reduce vibration, increase service life, and improve serviceability. Bearings that use set screws shall not be allowed.
5. All shaft bearings shall have extended lube lines with Zerk fittings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Install fans in accordance with manufacturer’s written installation instructions.

C. See Section 233113 – Metal Ducts for duct connections.

D. See Section 230900 – Energy Management & Control System.

E. Flexible duct connection at inlet and outlet: See Section 233113 – Ducts.

F. Backdraft Dampers.

1. Comply with ASHRAE 90.1 and IMC.
2. Provide backdraft or shutoff dampers for suction or discharge of every exhaust fan as scheduled on the Drawings.
3. See schedules on the Drawings and Section 233300 – Duct Accessories for where fan manufacturer may provide dampers and when specialty damper manufacturer must provide them.

G. Roof Mounted Fans.

1. Install on factory fabricated curbs.

a. Exception: Install Utility fans as indicated on the Drawings.

2. See Division 7 Thermal and Moisture Protection for waterproofing and roofing.
3. Roof curbs:

a. Secured to structure with hold down methods as detailed.
b. Made fully weatherproof.

H. Pipe scroll drains to code compliant waste receptacle.

3.2 MOUNTING AND ALIGNMENT

A. See Section 230548 – Mechanical Sound and Vibration Control.

3.3 INSPECTION

A. Verify that adequate clearance between fans and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 PRE-OPERATING CHECKS

A. Do not operate fans for any purpose, temporary or permanent, until:

1. Ductwork is clean.
2. Filters in place.
3. Bearings lubricated.

3.5 TESTING AND ADJUSTING

A. Before starting fans install belts and motor guards.

B. Start and test fans in accordance with manufacturers written installation instructions.

C. Start up and adjust fans to insure proper operation.

D. The submitted sound power level shall be verified through actual measurements and calculations in accordance with AMCA standards 300 and 301.

E. After starting fans: Check for objectionable noise or vibration. Correct as needed at no additional cost to the Owner.

F. Balancing: See Section 230593 – Testing, Adjusting and Balancing.

3.6 TRAINING

A. See Section 230010 – Mechanical General Provisions.

END OF SECTION 23 34 23

SECTION 23 36 00

AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Shutoff, single-duct air terminal units.

1.3 QUALITY ASSURANCE

A. Terminal units rated and certified in accordance with ARI Standard 880-98 Certification Program.

B. Heating coils rated in accordance with ARI Standard 410.

C. All electrical components shall be UL listed and installed in accordance with the UL Standard 1995.

1.4 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
VAV boxes	R	R		R
Hot water coils	R			R
Air terminal unit accessories	R	R		

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. VAV Boxes.

1. Titus.
2. Price.
3. Trane.
4. Or equal.

2.2 VAV BOXES

A. General.

1. Ship as a complete assembly requiring no field assembly (including accessories).
2. Casings:

a. Minimum 22-gage, galvanized steel outer wall.
b. Leakage rating: 7 cubic feet per minute maximum leakage at 1 inch water column.
c. Acoustic lining.

1) Material: Fiberglass with scrim-backed foil liner or solid metal lining over all surfaces and edges.
2) Minimum thickness:

a) Terminals located in conditioned space or return air plenum: 1/2 inch.
b) Terminals located in unconditioned spaces: 1 inch.

3) Minimum 1.5 pound per cubic foot density.
4) Maximum thermal conductivity: 0.28 Btu-in per hour per foot squared per degree Fahrenheit (BTU-inch/h·ft^2·°F) measured on a horizontal plane in accordance with ASTM C518 at a mean temperature of 75 degrees Fahrenheit.
5) Meet erosion test method described in UL publication No. 181.
6) Meet smoke developed and flame spread rating requirements of NFPA-90A.
7) Meet ASTM C1136 and ASTM C665 for biological growth in insulation.

d. Gasketted access door.

1) For actuators inspection, repair and replacement if mounted internally.
2) Upstream of reheat coil for inspection and cleaning.

e. Discharge duct connection.

3. Controls unit mounted by manufacturer.

a. Multi-point, cross-flow or flow-ring, center averaging sensor.

1) The average amplification factor for sizes 6 to 16 inch shall be greater than 2.0 and minimum amplification factor shall be 1.8. Provide documentation with submittal that substantiates this requirement.
2) Be rated for inlet or discharge duty, as indicated on the Drawings.
3) Provide accurate flow sensing regardless of inlet duct configuration.
4) Brass balancing taps and unit mounted airflow versus flow sensor pressure signal charts for field airflow measurements.

b. Control panel.

1) Control panel with cover to fully enclose VAV box controller.

c. For Direct Digital Controls, see Section 230900 – Energy Management & Control Systems

4. Radiated and discharge sound power.

a. Equal or less in each octave band than terminal selections scheduled on the Drawings at noted capacities assuming 1.0 inch inlet static pressure, with a tolerance of + 2 dB in any band.
b. Minimum performace sound power less than 68 dB in the 125 Hz octave band.
c. Due to added space and pressure drop, providing additional plenums or attenuators to meet sound power ratings is not acceptable.

5. Total pressure drop.

a. Equal or less than terminal selections scheduled on the Drawings at noted capacities, with a tolerance of 0.02 inches of water.
b. This limitation is in total, not static, pressure. Where total pressure is not listed on certified performance documents, provide a table of manual adjustments of static pressure with velocity pressure calculated from inlet and outlet velocities.

6. Dampers.

a. Heavy gage steel.
b. Single blade damper; opposed blade dampers are not acceptable.
c. Shaft rotating in self-lubricating Delrin or equal bearings; nylon bearings are not acceptable. Shaft shall be clearly marked on the end to indicate damper position.
d. Damper shall have durable synthetic seal. Foam seals are not acceptable.
e. Close-off leakage rating: 5 cubic feet per minute maximum leakage at 1.50 inches water column.

7. Hot water heating coils.

a. Removable type.
b. Tubes.

1) 2-row, unless otherwise scheduled on the Drawings.
2) Copper, 0.015 inches minimum tube wall thickness.
3) Connections: external, same end, solder type connection, minimum 1/2 inch outside diameter.

c. Fins.

1) Aluminum, with full fin collars.

2) As scheduled on the Drawings or as required to provide heating capacity listed.
3) Maximum: 12 fins per inch.

d. Factory leak-tested at 300 pounds per square inch.
e. Access or removable panel for coil inspection and cleaning.

B. Variable Air Volume Terminal Units.

1. Single duct: Equal to Trane VCWF.
2. Options and features: As scheduled on the drawings.
3. Electrical Services (factory mounted).

a. One point wiring connection for all electrical devices.
b. Control panel.
c. Controls transformer.
d. Components mounted in sheet metal control enclosure.
e. ETL or UL listed.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Install terminal units in accordance with manufacturer's written installation instructions.

C. Duct connections: See Section 233113 – Ducts.

1. Provide sheet metal duct connections at inlet; flexible not acceptable.
2. No flexible connection required on duct outlet.

D. Sound attenuation discharge duct.

1. Downstream of units where indicated on the Drawings.
2. Sound linings: Type AL. See Section 230713 – Duct Insulation.
3. Minimum lining 5 feet of duct downstream of box.
4. Provide a minimum of 3 feet of ductwork prior to first fitting or outlet branch duct takeoff.

E. Piping connections: See Section 232112 – Heating and Cooling Piping.

F. Coordinate access with respective trades.

G. See Section 230900 – Energy Management & Control Systems.

3.2 MOUNTING AND ALIGNMENT

A. Support VAV boxes at four corners with minimum, 1" x 18 gage sheet metal straps or 3/8 inch all-thread rod. Secure lower end of strap to the side of unit casing with minimum two #10 sheet metal screws, or bolt through casing with washers to prevent leakage. Bend end of strap and secure to bottom of casing with one #10 sheet metal screws.

B. See Section 230548 – Mechanical Sound and Vibration Control.

3.3 INSPECTION

A. Verify that adequate clearance between air terminal units and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 TESTING AND ADJUSTING

A. Before operating air terminal units.

1. Complete the provided Pre-Functional Test Data Sheet for each air terminal unit.

B. After starting air terminal units: Check for objectionable noise or vibration. Correct as needed at no additional cost to the Owner.

C. See Section 230593 – Testing, Adjusting, and Balancing.

3.5 TRAINING

A. See Section 23 00 10 – Mechanical General Provisions.

END OF SECTION 23 36 00

SECTION 23 37 00

AIR OUTLETS AND INLETS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following: All air outlets, inlets, grilles, registers and diffusers except where integral with manufactured piece of equipment

1.3 REFERENCE STANDARDS

A. ARI Standard 650 – Air Outlets and Inlets.

B. ASHRAE Standard 70 – Methods of Testing for Rating the Airflow Performance of Outlets and Inlets.

C. AMCA Standard 500 – Laboratory Methods of Testing dampers for Rating.

D. NFPA Standard 90A – Installation of Air Conditioning and Ventilating Systems.

E. NFPA 90B – Standard for the Installation of Warm Air Heating and Air Conditioning Systems.

1.4 QUALITY ASSURANCE

A. Comply with ARI Standard 650, ASHRAE Standard 70, AMCA Standard 500, NFPA Standard 90A, and NFPA Standard 90B.

B. Provide outlets and inlets that have, as minimum, throw and noise criteria ratings for each size device as listed in manufacturer's current data, rated as required by the above standards.

1.5 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.

2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Grilles, registers, and diffusers	R			R
Accessories	R			

PART 2 - PRODUCTS

2.1 MANUFACTUERERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

1. Price.
2. Titus.
3. Metal Aire.
4. Nailor.
5. Or equal.

2.2 GENERAL

A. Manufacturer shall examine and approve of application of each outlet.

B. Noise level at design capacities: no larger than diffuser selection indicated on the drawings.

C. Volume dampers:

1. Do not provide dampers built into grille or directly attached to the grille unless specifically called out on drawings or in this Section.
2. Volume damper key-operated adjustable from face of diffuser on register except as noted.
3. Opposed blade.

D. Diffuser frame:

1. Frame type shall be coordinated with ceiling type. Refer to architectural reflected ceiling Drawings.

   a. At plaster or drywall ceilings: lay-in diffuser with drywall frame (Price SPF or APF to match diffuser material). Drywall frame to match diffuser color.

2. No visible screw allowed on diffusers or frames, unless otherwise indicated on the Drawings.
3. Linear and bar diffusers shown as one collinear piece on plans shall be constructed as one piece within manufacturing limitations and to appear as one section if manufacturing limitations require multiple pieces.

E. Outlets may be steel or aluminum unless otherwise indicated on Drawings.

F. Color:

1. Face and frame: Factory-baked #26 white enamel unless otherwise indicated on the Drawings.
2. Internal parts of grille visible from occupied space, including all parts behind perforated face diffusers and visible parts of plenums: flat black.

G. Provide square to round adapters where required.

2.3 STYLES

A. General.

1. See diffuser schedule on the Drawings for outlet style and size.
2. Throw pattern per the Drawings.
3. Specific frame, border, and other product references refer to Price.

B. Square cone diffusers Price ASCD.

1. 3 cones.
2. Removable inner assembly of cones that extend below the diffuser face.

C. Sidewall – Supply Price 620.

1. Double deflection.
2. 3/4" blade spacing, fully adjustable.
3. Front set of blades shall run parallel with the short grille dimension.
4. Drywall frame with recessed screw holes.
5. Register with aluminum opposed blade damper.

D. Sidewall – Return Price 630.

1. 3/4" blade spacing, fully adjustable.
2. Blades shall run parallel with the short grille dimension.
3. Drywall frame with recessed screw holes.
4. Register with aluminum opposed blade damper.

E. Egg Crate Price 80.

1. 1/2" x 1/2" x 1/2" aluminum grid core.

F. Linear Slot Diffuser Price TBD4.

1. Three slots.
2. 1-inch slot.
3. Integral insulated plenum, minimum 1/2 inch thick equal to Type AL duct liner as specified under Section 230700 Mechanical Insulation.
4. Mitered corners.

G. Linear Jet Slot Diffuser Price JS.

1. Continuous linear slot diffuser.
2. Two slots.
3. 1-inch slot.
4. Mitered corners.

2.4 SCREENED OPENINGS

A. Mesh:

1. 3/4 in. square pattern.
2. No. 16 galvanized wire.
3. Interwoven.
4. Welded or secured to frame.

B. Frames:

1. 1 inch by 1 inch by 1/8 inch galvanized steel angles.
2. Continuous around perimeter of screen (welded at corners).

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Install air outlets and inlets in accordance with manufacturer's written installation instructions and Section 233113 – Ducts.

C. Return and exhaust registers: Install with blades oriented to prevent sight through outlets.

D. Grille backs or plenums visible through grilles painted flat black.

E. Transfer grilles.

1. See indications on the Drawings.
2. Wall installations, unless otherwise indicated, provide two grilles.

a. One on each side of wall, except where open to return air plenum.
b. Connecting sheet metal collar with 18 inch elevation offset for sound and light attenuation.

F. Provide duct screens at termination ducts as indicated on the Drawings.

3.2 MOUNTING AND ALIGNMENT

A. See Section 230548 – Mechanical Sound and Vibration Control.

B. All air outlets and inlets shall be secured to building.

1. Ceiling grilles shall be secured to prevent falling from ceiling during construction or service with minimum of two 16-gage ceiling wires, two 22-gage by 1 inch galvanized sheet metal strap or two #10 sheet metal screws.
2. Comply with IBC.

C. Mount directional grilles as indicated on the Drawings.

D. Adjust grille throw patterns.

1. As indicated on the Drawings.
2. For double-deflection grilles, adjust rear blades horizontal and front blades in 45 degree pattern at each end gradually rotating to be almost straight at blades in center of grille.
3. Adjust grille throw patterns prior to test and balance. See Section 230593 – Testing, Adjusting, and Balancing.

3.3 INSPECTION

A. Verify mounting, direction and adjustments are installed as indicated on the Drawings.

3.4 TESTING AND ADJUSTING

A. See Section 230593 – Testing, Adjusting, and Balancing.

END OF SECTION 23 37 00

SECTION 23 40 00

AIR CLEANING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Filter media.
2. Filter frames in built-up systems.

1.3 REFERENCE STANDARDS

A. ASHRAE Standard 52.2-1999 – Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size.

B. ANSI/UL 900 – Test Performance of Air Filter Units.

1.4 QUALITY ASSURANCE

A. Filters shall have MERV ratings in accordance with ASHRAE Standard 52.2 with preconditioning as specified in Appendix J of that Standard.

1.5 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Filters	R			
Filter frames	R			
Filter gauges	R	R		

PART 2 - PRODUCTS

2.1 MANUFACTUERERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Filter Media and Frames:

1. Camfil/Farr Filtration Group.
2. Flanders/Precisionaire.
3. American Air Filter.
4. Or equal.

2.2 FILTERS

A. General.

1. UL 900 listed.
2. Disposable type.
3. Each filter shall consist of media, media support grid, and enclosing frame.
4. Each filter shall have flow direction and MERV rating permanently affixed to frame.

B. Type 1: Pleated Filter:

1. 2 inch or 4 inch pleated.
2. Media: Cotton & synthetic media (no polyester).
3. Minimum performance:

    a. MERV 8.

4. Maximum initial pressure drop at 500 feet per minute face velocity shall not to exceed 0.3 inches water column. Final pressure drop shall be no less than 1.0 inch water column.
5. Camfil/Farr 30/30 or equal.

C. Type 2: Bulk Media:

1. 1 inch fiberglass.
2. Filter media shall consist of a continuous filament fiberglass of graduated density. Media shall include a skin on the leaving air side. Furthermore, the media shall be treated with a non-toxic, non-flammable, odor free adhesive.
3. UL listed, Class 2.

2.3 FRAMES

A. For air handlers and fan-coils, see individual specifications Sections.

2.4 FILTER GAUGE

A. See Section 230900 – Energy Management & Control Systems (DP sensors with LCD display).

B. Differential pressure type.

C. Accurate to 2 percent of full range.

D. Sensing probes and shut off valves for each gauge port.

E. Field adjustable to 2 inches water gauge.

F. Dwyer 2000 Magnehelic gauge or equal.

PART 3 - EXECUTION

3.1 FILTER MEDIA

A. Media as selected in equipment schedules on the Drawings.

B. Construction filters:

1. Type 1 for all equipment: roll media not acceptable.
2. Type 2 filter media is intended to be utilized over return/exhaust air grilles, registers and/or open ductwork during the construction period when the systems are being operated. This filter media in not to be utilized inside the housing of any HVAC systems.

C. Spare Filters:

1. Provide three (3) sets of spare filters for each piece of HVAC equipment and filter grille except the following (provide only one (1) spare set):

   a. PTAC's (thru-wall units).
   b. VRF system (indoor units).

3.2 INSTALLATION

A. Factory installed in air handling equipment.

B. Coordinate with work of other trades.

C. Install Air Cleaning Devices in accordance with manufacturer's written installation instructions.

D. Filter gauges.

1. Required only for filters with MERV 8 and greater and on systems greater than 2000 cfm.
2. Install filter gauge to filter or AHU housing in a position where reading will be visible but not block maintenance access.
3. Mount probes on upstream and downstream side of filter and pipe to gauge ports with soft copper tubing per gauge manufacturer's instructions.

E. See Section 230900 – Energy Management & Control Systems.

F. See Section 230593 – Testing, Adjusting, and Balancing.

3.3 START-UP PROCEDURES

A. Do not operate air handling unit fan systems for any reason until spaces served have been cleaned of dust and debris, to avoid contamination of supply air or return air paths and equipment.

B. Supply fans shall not be operated unless filters are installed, including temporary filters for use during test and balance.

C. If the final pressure drop of the temporary filters is reached during test and balance, replace them with a spare set.

D. Before turning system over to the Owner, remove temporary construction filters and install clean final filters:

1. Remove prefilters in front of cartridge, bag, and HEPA filters after construction and do not replace. Prefilters shall not be used during normal operation.
2. See also Section 230593 – Testing, Adjusting, and Balancing, Section 230010 – Mechanical General Provisions and Section 230500 – Basic Materials and Methods for media installation during temporary equipment operation and test and balance periods.

3.4 INSPECTION

A. Verify that adequate clearance between Air Cleaning Devices and adjacent walls or equipment is available to permit maintenance and replacement of filters.

B. Verify that filters are firmly seated in frame to minimize bypass.

3.5 TRAINING

A. See Section 230010 – Mechanical General Provisions.

END OF SECTION 23 40 00

SECTION 23 52 16

CONDENSING BOILERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes gas-fired, fire-tube condensing boilers, trim, and accessories for generating hot water.

1. Boilers.
2. Controls and boiler trim.

1.3 REFERENCE STANDARDS

A. Published specifications standards, tests or recommended methods of trade, industry or governmental organizations apply to work in this section where cited below:

1. CSA – Canadian Standards Association International.
2. American Society of Mechanical Engineers: ASME Section VIII – Boiler and Pressure Vessel Code – Pressure Vessels.
3. ANSI Z21.13 Standard for Gas-Fired Low Pressure Steam and Hot Water Boilers.
4. AHRI/GAMA/Hydronics Institute Testing and Rating Standard for Rating Boilers.

1.4 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Boilers	R	R		R
Boiler controls and trim	R	R		R

C. Boiler

1. Certified dimensioned shop drawings.
2. Materials of construction, thickness of tubes, shell, boilerplate and insulation.
3. Firing and combustion air control systems.
4. Electrical requirements.
5. Safety devices.
6. Minimum and maximum gas pressure at burner.
7. Controls.
8. Wiring diagrams.
9. Field mounted equipment and devices.

D. Manufacturer's instructions for:

1. Installation.
2. Operation.
3. Maintenance and repair.

E. Boiler factory fire test confirming emissions, turndown and efficiency including:

1. Percent of oxygen at 100 percent, 75 percent, 50 percent, and 25 percent of rated capacity.
2. Percent NOx at 100 percent, 75 percent, 50 percent, and 25 percent of rated capacity.
3. Fuel efficiency at 100 percent, 75 percent, 50 percent, and 25 percent of rated capacity.

F. Written warranty indicating full compliance with Warranty paragraph herein.

1.5 WARRANTY

A. The pressure vessel and heat exchanger shall be fully guaranteed for 10 years, non-prorated, against failure due to condensate corrosion, thermal stress, mechanical defects, or workmanship without a minimum flow rate or minimum return water temperature requirement.

B. All other components, including but not limited to forced draft fans, diffusers, burner housing, pilot assemblies, etc., shall be unconditionally guaranteed for 5 years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models are acceptable.

1. Fulton.
2. Aerco.
3. Cleaver-Brooks.
4. Or equal.

2.2 GENERAL

A. Factory assembled, piped, wired and tested.

1. Manufacturer responsible for all unit components for fully functional boiler assembly.
2. Factory assembled as a self-contained unit.
3. Test and fired at factory.

B. Constructed and certified in accordance with.

1. ASME Code Section IV.
2. ASME “H” Stamp.
3. ASME CSD-1 Code requirements.
4. AHRI/GAMA Efficiency Rating Certified.

C. Maximum operating conditions.

1. 190 degrees Fahrenheit.
2. 160 psig working pressure.

D. Single point power connection. Include all required transformers.

E. The boiler shall not require the use of flow switches or other devices to ensure minimum flow.

F. Performance:

1. See schedule on Drawings for.

   a. Design pressure.
   b. Design temperatures.
   c. Capacity.

2. Minimum efficiency.

   a. Minimum 10:1 turndown.
   b. Greater than 91% steady-state thermal efficiency as certified by AHRI.
   c. Efficiency shall increase as firing rate decreases.

3. External convection and radiation heat losses to the boiler room from the boiler shall be less than 0.5 percent of the rated input.

2.3 BOILER CONSTRUCTION

A. Heat Exchanger.

1. 316 L stainless steel designed for condensing flue gases.
2. 40 °F minimum boiler return water temperature.
3. Zero minimum flow rate required. (If substituted boiler requires minimum flow, Contractor shall provide all pumps, valves, controls, etc. required at no additional cost to the Owner.)

B. Combustion Fan & Venting.

1. Built-in forced draft variable speed fan modulated to maintain correct fuel-to-air ratio at all gas valve operating conditions. There shall be no linkage of any kind controlling the burner and or firing rate.
2. Damper to shut-off combustion airflow when boiler is off (to reduce cycling losses).
3. Vertical or horizontal venting with Category IV vent. See Section 233113 – Ducts.

4. Combustion air either direct ducted from outdoors or air drawn from boiler room (see Contract Drawings).

C. Gas Burner.

1. Natural gas.
2. Modulating power burner.
3. Spark ignition (no standing pilot).

D. Gas Train.

1. UL 795 compliant.
2. ASME CSD-1.
3. Each gas train shall have a gas shutoff valve and main gas valve with built-in redundant valve seats and gas regulator.

E. Trim.

1. Drain connection.
2. Combination thermometer and pressure gauge.
3. Safety Relief Valve: ASME rated, factory set to pressure scheduled on drawings.
4. Condensate trap and condensate neutralizer.

2.4 CONTROLS

A. LCD and touchpad visible without the removal of any panels or doors for configuration and setpoint adjustment. Display at a minimum:

1. Power on.
2. Call for heat.
3. Failure/alarm.
4. Hot water supply temperature.

B. External control and monitoring (by EMCS).

1. 4-20 mA input to reset boiler leaving water temperature setpoint.
2. Failure alarm contact.
3. Pump start contact with adjustable relay.
4. BACnet/MSTP remote communications interface.

C. Safeties.

1. Safeguard/flame monitoring system utilizing a rectification type flame sensor.
2. Dual water high limits.
3. Air pressure switch.
4. Main and auxiliary low water cutoff. Switches shall not require manual reset after power outage.

PART 3 - EXECUTION

3.1 BOILER INSTALLATION

A. Complete structural, mechanical, and electrical connections in accordance with manufacturer's installation instructions.

B. Provide start-up service by factory representative.

C. Install boilers as indicated on drawings.

1. Install in accordance with NFPA 54.
2. Allow satisfactory arrangement in space available.
3. Provide sufficient room for replacing boiler tubes, cleaning, and servicing of components.
4. Anchor through vibration isolation devices in accordance with Section 230548 – Mechanical Sound and Vibration Control.

D. Boiler Trim.

1. Provide blowdown valves for low water cutoffs to floor drain.
2. Pipe drain valves to floor drain.
3. Pipe discharge of relief valves, full size to floor drain.
4. Pipe condensate drain(s) through the condensate trap (use tubing suitable for pH 5 water) to the condensate neutralizer then to drain.

E. Connect to flue (and combustion intake where applicable) per manufacturer's instructions. See Section 233113 – Ducts.

3.2 TESTS AND START-UP

A. After installation is completed.

1. Test boilers hydrostatically in accordance with ASME recommendations: Test to specified working pressure.
2. Test operating and safety controls by firing boiler and,

    a. Raising water temperature.
    b. Lowering water level.

3. Test burner capacity by observing gas meter while firing burners at high fire. Gas consumption shall be within 5 percent of rated input.

B. Provide services of factory representative of boiler manufacturer to:

1. Supervise start up and adjust burners and controls.
2. Test individual burner controls for proper operation.
3. Test safety controls for proper operation.
4. Test burner firing rates for proper capacity.

C. Submit written report by boiler manufacturer confirming that safety and operating controls and burners have been properly installed, calibrated and adjusted.

3.3 CLEANING

A. Flush and clean boiler on completion of installation, according to manufacturer's written instructions.

B. After completing boiler installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes including chips, scratches, and abrasions with manufacturer's touchup paint.

3.4 TRAINING

A. Engage a factory-authorized service representative to train Owner’s maintenance personnel on:

1. Procedures for starting and stopping and troubleshooting boilers.
2. Procedures and schedules for maintaining and servicing boilers.
3. Organization and content of boiler Operations & Maintenance Manuals.

B. Electrical: Comply with applicable requirements in Division 26 Sections.

C. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

END OF SECTION 23 52 16

SECTION 23 64 26

SCREW WATER CHILLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Packaged, air-cooled chillers.

1.3 DEFINITIONS

A. COP: Coefficient of performance. The ratio of the rate of heat removal to the rate of energy input using consistent units for any given set of rating conditions.

B. DDC: Direct digital control.

C. EER: Energy-efficiency ratio. The ratio of the cooling capacity given in terms of Btu/h to the total power input given in terms of watts at any given set of rating conditions.

D. IPLV: Integrated part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by AHRI 550/590 and referenced to AHRI standard rating conditions.

E. kW/Ton: The ratio of total power input of the chiller in kilowatts to the net refrigerating capacity in tons at any given set of rating conditions.

F. NPLV: Nonstandard part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by AHRI 550/590 and intended for operating conditions other than AHRI standard rating conditions.

1.4 SUBMITTALS

A. See Section 23 00 10 Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings (where shop and coordination drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Chillers	R	R		R
Chiller controls	R	R		
Chiller accessories	R	R		
Chiller BACnet PICS Statement	R			

C. Product Data: For each type of product.

1. Performance at ARI standard conditions and at conditions indicated.
2. Performance at ARI standard unloading conditions.
3. Performance data including; unit efficiency, full load and part load performance data, acoustical data, etc.
4. Minimum evaporator flow rate.
5. Refrigerant capacity of water chiller.
6. Oil capacity of water chiller.
7. Fluid capacity of evaporator.
8. Minimum entering condenser-air temperature.
9. Performance at varying capacity with constant design entering condenser-air temperature. Repeat performance at varying capacity for different entering condenser-air temperatures from design to minimum in 10 ˚F increments.
10. Dimensioned plan and elevation view drawings, required clearances, and location of all field connections.
11. Product data indicating rated capacities, weights, specialties and accessories, electrical requirements and wiring diagrams.
12. Required clearances for maintenance and operation.
13. Size and location of piping and wiring connections.
14. Wiring Diagrams: For power, signal, and control wiring.

D. Coordination Drawings: Floor plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Structural supports.
2. Piping roughing-in requirements.
3. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
4. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.

E. Startup service reports.

F. Warranty: Sample of special warranty.

G. Touchup Paint: 32 oz. container of paint used for finish coat. Label outside of container with detailed description of paint to allow for procurement of a matching paint in the future.

1.5 QUALITY ASSURANCE

A. AHRI Certification: Certify chiller according to AHRI 590 certification program(s).

B. AHRI Rating: Rate chiller performance according to requirements in AHRI 550/590.

C. ASHRAE Compliance:

1. ASHRAE 15 for safety code for mechanical refrigeration.
2. ASHRAE 147 for refrigerant leaks, recovery, and handling and storage requirements.

D. ASHRAE/IES Compliance: Applicable requirements in ASHRAE/IES 90.1.

E. ASME Compliance: Fabricate and label chiller to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, and include an ASME U-stamp and nameplate certifying compliance.

F. Comply with NFPA 70.

G. Comply with requirements of UL and UL Canada and include label by a qualified testing agency showing compliance.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Ship chillers from the factory fully charged with refrigerant.

B. Ship each chiller with a full charge of refrigerant. Charge each chiller with nitrogen if refrigerant is shipped in containers separate from chiller.

C. Ship each oil-lubricated chiller with a full charge of oil.

1. Ship oil factory installed in chiller.

D. During shipment, provide protective covering over vulnerable components. Fit nozzles and open pipe ends with enclosures.

E. Comply with Section 230010 “Mechanical General Provisions.”

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of chillers that fail in materials or workmanship within specified warranty period.

1. Extended warranties include, but are not limited to, the following:

a. Complete chiller including refrigerant and oil charge.
b. Parts and labor.
c. Loss of refrigerant charge for any reason.

2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Performance Tolerance: Comply with the following in lieu of AHRI 550/590:

1. Allowable Capacity Tolerance: Five (5) percent.
2. Allowable Full-Load Energy Efficiency Tolerance: Five (5) percent.

3. Allowable Part-Load Energy Efficiency Tolerance: Five (5) percent.

2.2 PACKAGED, AIR-COOLED CHILLERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Daikin Applied.
2. Trane.
3. YORK; a Johnson Controls company.
4. Or equal.

B. Description: Factory-assembled and run-tested chiller complete with base and frame, condenser casing, compressors, compressor motors and motor controllers, evaporator, condenser coils, condenser fans and motors, electrical power, controls, and accessories.

C. Fabricate base, frame, and attachment to chiller components strong enough to resist chiller movement during a seismic event when chiller base is anchored to field support structure.

D. Cabinet:

1. Base: Galvanized-steel base extending the perimeter of chiller. Secure frame, compressors, and evaporator to base to provide a single-piece unit.
2. Frame: Rigid galvanized-steel frame secured to base and designed to support cabinet, condenser, control panel, and other chiller components not directly supported by base.
3. Casing: Galvanized steel.
4. Finish: Coat base, frame, and casing with a corrosion-resistant coating capable of withstanding a 1000-hour salt-spray test according to ASTM B 117.
5. Sound-reduction package designed to reduce sound level without affecting performance and consisting of the following:

    a. Acoustic enclosure around compressors.
    b. Reduced-speed fans with acoustic treatment.

6. Architectural Louvered Panel Package: Provide removable louvered panels with fasteners for additional protection of compressors, evaporator, and condenser coils without inhibiting service access. Finish to match cabinet.

E. Compressors:

1. Description: Positive displacement, hermetically sealed.
2. Casing: Cast iron, precision machined for minimum clearance about periphery of rotors.
3. Rotors: Manufacturer's standard one- or two-rotor design.
4. Each compressor provided with suction and discharge shutoff valves, crankcase oil heater, and suction strainer.

F. Service: Easily accessible for inspection and service.

G. Capacity Control: On-off compressor cycling and modulating slide-valve assembly or port unloaders combined with hot-gas bypass, if necessary, to achieve performance indicated.

1. Maintain stable operation throughout range of operation. Configure to achieve most energy-efficient operation possible.
2. Operating Range: From 100 to 10 percent of design capacity.

3. Condenser-Air Unloading Requirements over Operating Range: Drop-in, entering condenser-air temperature of 5 ˚F drop for each 10 percent in capacity reduction.

H. Oil Lubrication System: Consisting of pump if required, filtration, heater, cooler, factory-wired power connection, and controls.

1. Provide lubrication to bearings, gears, and other rotating surfaces at all operating, startup, shutdown, and standby conditions including power failure.
2. Thermostatically controlled oil heater properly sized to remove refrigerant from oil.
3. Factory-installed and pressure-tested piping with isolation valves and accessories.
4. Oil compatible with refrigerant and chiller components.
5. Positive visual indication of oil level.

I. Vibration Control:

1. Vibration Balance: Balance chiller compressors and drive assemblies to provide a precision balance that is free of noticeable vibration over the entire operating range.

a. Overspeed Test: 25 percent above design operating speed.

2. Isolation: Mount individual compressors on vibration isolators.

J. Compressor Motors:

1. Hermetically sealed and cooled by refrigerant suction gas.
2. High-torque, induction type with inherent thermal-overload protection on each phase.

K. Compressor Motor Controllers:

1. Star-Delta, Reduced-Voltage Controller: NEMA ICS 2, closed transition.

L. Refrigerant Circuits:

1. Refrigerant: Type as indicated on Drawings.
2. Refrigerant Type: R-134a. Classified as Safety Group A1 according to ASHRAE 34.
3. Refrigerant Compatibility: Chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
4. Refrigerant Circuit: Each shall include a thermal- or electronic-expansion valve, refrigerant charging connections, a hot-gas muffler, compressor suction and discharge shutoff valves, a liquid-line shutoff valve, a replaceable-corefilter-dryer, a sight glass with moisture indicator, a liquid-line solenoid valve, and an insulated suction line.
5. Pressure Relief Device:

a. Comply with requirements in ASHRAE 15 and in applicable portions of ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
b. ASME-rated, spring-loaded pressure relief valve; single- or multiple-reseating type.

M. Evaporator:

1. Description: Shell-and-tube design.

a. Flooded type with fluid flowing through tubes and refrigerant flowing around tubes within the shell.

2. Code Compliance: Tested and stamped according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
3. Shell Material: Carbon steel.
4. Shell Heads: Removable carbon-steel heads located at each end of the tube bundle.
5. Fluid Nozzles: Terminated with grooved end connections for connection to field piping.
6. Tube Construction: Individually replaceable copper tubes with enhanced fin design, expanded into tube sheets.
7. Heater: Factory-installed and -wired electric heater with integral controls designed to protect the evaporator to 0 ˚F.

N. Air-Cooled Condenser:

1. Plate-fin coil with integral subcooling on each circuit, rated at 450 psig.

    a. Construct coil casing of galvanized steel.
    b. Construct coils of copper tubes mechanically bonded to aluminum fins.
    c. Hail Protection: Provide condenser coils with louvered panels to protect against hail damage.

2. Fans: Direct-drive propeller type with statically and dynamically balanced fan blades, arranged for vertical air discharge.
3. Fan Motors: Totally enclosed nonventilating or totally enclosed air over enclosure, with permanently lubricated bearings. Equip each motor with overload protection integral to either the motor or chiller controls.
4. Fan Guards: Steel safety guards with corrosion-resistant coating.

O. Electrical Power:

1. Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point, field-power connection to chiller.
2. House in a unit-mounted, NEMA 250, Type 3R enclosure with hinged access door with lock and key or padlock and key.
3. Wiring shall be numbered and color-coded to match wiring diagram.
4. Install factory wiring outside of an enclosure in a raceway.
5. Field-power interface shall be to UL 489, instantaneous-trip circuit breaker with lockable handle.

    a. Disconnect means shall be interlocked with door operation.

6. Provide branch power circuit to each motor and to controls with one of the following disconnecting means:

    a. NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection according to IEC 60947-4-1.
    b. UL 489, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit-trip set point.

7. Provide each motor with overcurrent protection.
8. Overload relay sized according to UL 1995 or an integral component of chiller control microprocessor.
9. Phase-Failure and Undervoltage Relays: Solid-state sensing with adjustable settings.
10. Control Transformer: Unit-mounted transformer with primary and secondary fuses and sized with enough capacity to operate electrical load plus spare capacity.

a. Power unit-mounted controls where indicated.
b. Power unit-mounted, ground fault interrupt duplex receptacle.

11. Control Relays: Auxiliary and adjustable time-delay relays.
12. For chiller electrical power supply, indicate the following:

a. Current and phase to phase for all three phases.
b. Voltage, phase to phase, and phase to neutral for all three phases.
c. Three-phase real power (kilowatts).
d. Three-phase reactive power (kilovolt amperes reactive).
e. Power factor.
f. Running log of total power versus time (kilowatt-hours).
g. Fault log, with time and date of each.

P. Controls:

1. Standalone and microprocessor based.
2. Enclosure: Share enclosure with electrical power devices or provide a separate enclosure.
3. Control panel shall be dead front construction for enhanced service technician safety. Provide and field install NEMA 4 enclosure over factory-mounted unit controller for protection. Coordinate NEMA 4 enclosure dimensions with unit controller dimensions.

a. NEMA 4 enclosure with lift-off hinges.
b. Continuously welded, no holes or knockouts.
c. Seamless, watertight foam gasket.
d. Hasp and staple for padlocking.
e. Removable door.
f. Hoffman NEMA 4 A-ALP or equal.

4. Operator Interface: Multiple-character digital or graphic display with dynamic update of information and with keypad or touch-sensitive display located on front of control enclosure. In either imperial or metric units, display the following information:

a. Date and time.
b. Operating or alarm status.
c. Operating hours.
d. Outdoor-air temperature if required for chilled-water reset.
e. Temperature and pressure of operating set points.
f. Entering and leaving temperatures of chilled water.
g. Refrigerant pressures in evaporator and condenser.
h. Saturation temperature in evaporator and condenser.
i. No cooling load condition.
j. Elapsed time meter (compressor run status).
k. Pump status.
l. Antirecycling timer status.
m. Percent of maximum motor amperage.
n. Current-limit set point.
o. Number of compressor starts.

5. Control Functions:

a. Manual or automatic startup and shutdown time schedule.
b. Entering and leaving chilled-water temperatures, control set points, and motor load limits.

c. Current limit and demand limit.
d. External chiller emergency stop.
e. Anti-recycling timer.
f. Automatic lead-lag switching.
g. Variable evaporator flow.

6. Manually Reset Safety Controls: The following conditions shall shut down chiller and require manual reset:

a. Low evaporator pressure or high condenser pressure.
b. Low chilled-water temperature.
c. Refrigerant high pressure.
d. High or low oil pressure.
e. High oil temperature.
f. Loss of chilled-water flow.
g. Control device failure.

7. Trending: Capability to trend analog data of up to five parameters simultaneously over an adjustable period and frequency of polling.
8. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: view only; view and operate; and view, operate, and service.
9. Control Authority: At least four conditions: Off, local manual control at chiller, local automatic control at chiller, and automatic control through a remote source.
10. Interface with Energy Management and Control System (EMCS): Factory-installed hardware and software to enable the EMCS to monitor, control, and display chiller status and alarms.

a. Hardwired Points:

1) Control: On-off operation,

b. ASHRAE 135 (BACnet) communication interface with the DDC system for HVAC shall enable the DDC system for HVAC operator to remotely control and monitor the chiller from an operator workstation. Control features and monitoring points displayed locally at chiller control panel shall be available through the DDC system for HVAC.

Q. Insulation:

1. Material: Closed-cell, flexible elastomeric, thermal insulation complying with ASTM C 534, Type I for tubular materials and Type II for sheet materials.
2. Thickness: 1-1/4 inches (high-humidity insulation package).
3. Factory-applied insulation over cold surfaces of chiller components.

a. Adhesive: As recommended by insulation manufacturer and applied to 100 percent of insulation contact surface. Seal seams and joints.

4. Apply protective coating to exposed surfaces of insulation to protect insulation from weather.

R. Accessories:

1. Factory-furnished, thermal dispersion typed chilled-water flow switch for field installation, if not factory installed.

2. Individual compressor suction and discharge pressure gages with shutoff valves for each refrigerant circuit.
3. Factory-furnished neoprene isolators for field installation.
4. Low ambient kit: Allow chiller operation down to 0 ˚F.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine chillers before installation. Reject chillers that are damaged.

B. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting chiller performance, maintenance, and operations before equipment installation.

1. Final chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CHILLER INSTALLATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.

B. Coordinate sizes, locations, and anchoring attachments of structural-steel support structures.

C. Provide additional structural-steel as required.

D. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

E. Install chillers on support structure indicated.

F. Equipment Mounting:

1. Install chillers on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Division 03.
2. Comply with requirements for vibration isolation devices specified in Section 230548. "Mechanical Sound and Vibration."

G. Maintain manufacturer's recommended clearances for service and maintenance.

H. Charge chiller with refrigerant and fill with oil if not factory installed.

I. Install separate devices furnished by manufacturer and not factory installed.

3.3 CONNECTIONS

A. Comply with requirements for piping specified in Section 232112 "Heating and Cooling Piping," Section 230516 Piping Specialties," Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to chiller to allow service and maintenance.

C. Evaporator Fluid Connections: Connect to evaporator inlet with shutoff valve, strainer, flexible connector, thermometer, and plugged tee with pressure gage. Connect to evaporator outlet with shutoff valve, balancing valve, flexible connector, flow switch, thermometer, plugged tee with shutoff valve and pressure gage, and drain connection with valve. Make connections to chiller with a flange or mechanical coupling.

D. Connect each chiller drain connection with a union and drain pipe, and extend pipe, full size of connection, to floor drain. Provide a shutoff valve at each connection.

3.4 ELECTRICAL POWER CONNECTIONS

A. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

B. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

C. Provide nameplate for each electrical connection indicating electrical equipment designation and circuit number feeding connection. Nameplate shall be laminated phenolic layers of black with engraved white letters at least 1/2 inch high. Locate nameplate where easily visible.

3.5 CONTROLS CONNECTIONS

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring between chillers and other equipment to interlock operation as required to provide a complete and functioning system.

C. Connect control wiring between chiller control interface and EMCS system for remote monitoring and control of chillers. Comply with requirements in Section 230900 "Energy Management and Control System - General."

D. Provide nameplate on face of chiller control panel indicating control equipment designation serving chiller and the I/O point designation for each control connection. Nameplate shall be laminated phenolic layers of black with engraved white letters at least 1/2 inch high.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Verify that refrigerant charge is sufficient and chiller has been leak tested.
3. Verify that pumps are installed and functional.
4. Verify that thermometers and gages are installed.

5. Operate chiller for run-in period.
6. Check bearing lubrication and oil levels.
7. For chillers installed indoors, verify that refrigerant pressure relief device is vented outdoors.
8. Verify proper motor rotation.
9. Verify static deflection of vibration isolators, including deflection during chiller startup and shutdown.
10. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.

B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assembly, installation, and connection.

C. Prepare test and inspection startup reports.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain chillers.

END OF SECTION 23 64 26

SECTION 237313

MODULAR CENTRAL-STATION AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Air handling units.
2. Field installed coils.

1.3 REFERENCE STANDARDS

A. AMCA 99 – Standards Handbook.

B. AMCA Standard 203.

C. ANSI/AMCA 210 – Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.

D. ANSI/AMCA 230 – Laboratory Methods of Testing Air Circulator Fans for Rating.

E. AMCA 300 – Reverberant Room Method of Sound Testing of Fans.

F. AMCA Standard 301 – Method for Calculating Fan Sound Ratings from Laboratory Test Data.

G. AMCA Standard 500-D – Laboratory Methods of Testing Dampers for Rating.

H. AMCA 500-L – Laboratory Methods of Testing Louvers for Rating.

I. ARI 410 – Standard for Forced – Circulation Air-Cooling and Air Heating Coils.

J. ARI 430 – Central Station Air-Handling Units.

K. ANSI/AFBMA 9 – Load Ratings and Fatigue Life for Ball Bearings.

L. ANSI/AFBMA 11 – Load Ratings and Fatigue Life for Roller Bearings.

M. ASHRAE/ANSI Standard 111.

N. ASHRAE Standard 52.

O. ASTM A525 – Specification for General Requirements for Steel Sheet, Zinc Coated (Galvanized) by the Hot-Dip Process.

P. NFPA 90A – Installation of Air Conditioning and Ventilation Systems.

Q. SMACNA – Low Pressure Duct Construction Standards.

R. UL Standard 1995.

1.4 QUALITY ASSURANCE

A. AMCA certified ratings per applicable AMCA standard based on the testing conducted in an independent laboratory.

B. Conform to AMCA Bulletins regarding construction and testing. Fans shall bear AMCA certified rating seal for both sound and performance.

C. Units shall be designed and manufactured in strict accordance with UL 1995, Standard for Heating and Cooling Equipment. Air handler shall be ETL or UL listed in accordance with UL 1995, or the current equivalent by UL, and shall carry the ETL or UL label. If manufacturer cannot provide ETL/UL sticker on air handler, it will be the sole responsibility of the contractor to arrange for local, on-site, ETL or UL approval and labeling at no additional cost to the Owner.

D. Schedule equipment performance is minimum capacity required.

1.5 SUBMITTALS

A. See Section 23 00 10 Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings (where shop and coordination drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Air handling units	R	R		R
Coils, performance data	R	R		R
Fans, performance data	R			
Acoustical performance data	R			
Motors	R	R		
Variable frequency drives	R	R		R
Dampers and actuators	R	R		
Filters	R			
Factory installed controls	R	R		R
Accessories	R	R		R
Coordination drawings				R

C. Additional submittal requirements.

1. List of exceptions to the specifications including section number and a detailed description of alternative materials and methods. If there are no exceptions, so state in precise language.
2. List of proposed manufacturers for fans, filters, coils, motors, drives, dampers and other components.
3. Complete graph of fan curves (not just curve for design conditions) indicating efficiency, BHP, and RPM.
4. Sound power levels per ARI 260 by octave bands; radiated and at inlet and discharge.
5. Coil performance and flow rates.
6. Filter and filter frame product data.
7. Wiring diagram.
8. Control panel location, including elevation indicating height above the ground.
9. Internal static pressure drop with filters clean and dirty.
10. Casing materials of construction and methods of assembly.
11. Construction details including panel sealing, thermal break, door seal and hardware, shipping split and field treatment of panel penetration (sleeve) details.
12. The number of shipping sections requiring field reassembly.
13. Complete dimensional data including exterior dimensions and dimensions of internal components.
14. Coordination Drawings: Submit with Shop Drawings. Show mechanical-room layout and relationships between components and adjacent structural and mechanical elements. Show service clearance requirements, and support locations, type of support, and weight on each support. Indicate and certify field measurements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models are acceptable.

1. Daikin.
2. Trane.
3. York/Johnson Controls.
4. Or equal.

2.2 GENERAL

A. Types and performance as scheduled on Drawings.

B. Performance certified under ARI Standard 430.

C. Units prepared for shipping with all openings securely covered and watertight.

D. All outdoor opening shall have a 1/2 inch mesh bird-screen provided on louvers.

2.3 FANS, MOTORS, AND DRIVES

A. Comply with Section 233400 – HVAC Power Ventilators and Section 230513 – Motors and Controllers.

B. Mounted on common shaft.

C. Type.

1. As schedule, or:
2. Any type that has no greater sound power levels and fan power than fan selected on Drawings. All sound pressure level measurements and calculations shall be in accordance with the latest version of AMCA Standard 300 Reverberant Room Method for Sound Testing of Fans and AMCA Standard 301 Method for Calculating fan Sound Ratings from Laboratory Test Data. Test and calculation procedures based on sound intensity measurements may be substituted for the above procedures, if directed in advance by the Professional.

D. Discharge arrangement: As indicated on the Drawings.

2.4 CABINETS

A. Double wall, 2-inch thick with solid galvanized steel exterior and interior panels.

1. Outer liner: Minimum 16-gage galvanized sheet metal.
2. Inner liner shall be 20 gage solid galvanized steel except as follows:

a. Provide solid 304 stainless steel liner at humidifier, 1 foot upstream, 3 feet downstream.
b. Provide 22 gauge perforated steel liner in any section of the unit (except at cooling coil) where required to meet acoustical criteria, and at a minimum in all sections exposed to the fan.

B. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

C. Insulation.

1. Minimum 2-inches thick.
2. Minimum 1.5 pound density.
3. Casing panels (roof, walls, floor) and external structural frame members shall be completely insulated filling the entire panel cavity in all directions so that no voids exist. Panel insulation shall comply with NFPA 90A.

D. Cabinets should be provided with a minimum 6-inch base rail sufficient to support the weight of the unit from the four corners.

E. Reinforced and braced with angles configured such that all side panels are removable without compromising structural integrity of unit.

F. Coils shall be removable from side or top panels.

G. Standard factory finish.

1. Indoor units galvanized.
2. Outdoor units painted: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-on enamel finish, consisting of prime coat and thermosetting topcoat.

2.5 ACCCESS DOORS

A. Hinged access doors with quick opening handles.

B. Gasketted air tight when closed.

C. Sections with windows minimum are 12 inches by 12 inches.

1. Economizer section.
2. Fan section.

D. Sections without window.

1. Both upstream and downstream of cooling coils.
2. Upstream of filter section.

E. All doors shall be a 60-inch high when sufficient unit height is available, or the maximum height allowed by the unit height.

F. Multiple door handles shall be provided for each latching point of the door necessary to maintain the specified air leakage integrity of the unit.

2.6 DRAIN PANS

A. Under cooling coil and extending under blank plenum section downstream.

B. 304 Stainless steel: minimum 16-gauge; in accordance with ASHRAE 62.1.

C. Corners soldered, welded or brazed.

D. Pitched to drain flange to fully drain; double broken, double sloped to ensure no standing water.

E. Drain flange.

1. Minimum per code.
2. Stainless steel or brass.
3. Welded or soldered into bottom of pan.

F. Accessible for cleaning.

G. Insulation: minimum 1 in. thick, coated fiberglass board or injected foam insulation, NFPA-90 or UL listed: Intermediate drain pans need not be insulated.

2.7 FILTER SECTION

A. Holding Frames: Holding frames shall be factory fabricated of 16-gage galvanized steel and shall be equipped with gaskets and 2 heavy duty positive sealing fasteners. Each fastener shall

be capable of withstanding 25 pounds pressure without deflection and be attached or removed without the use of tools.

B. Filter type, MERV rating, and arrangement shall be provided as defined in Section 234000 – Air Cleaning Devices.

C. Filters shall be lifted out where access is available upstream of the filter, or side slide out when front access is not available.

D. Filter gauges: See Section 234000 – Air Cleaning Devices.

E. Performance: Select fan for mean pressure drop (midway from clean to maximum).

F. Manufacturer shall provide one set of startup filters.

2.8 ECONOMIZER (OR MIXING BOX)

A. Low leakage parallel blade dampers, Ruskin CD-60 or equal.

B. Outdoor air and return airflow directed into each other.

C. Actuators: See Section 230913 – EMCS Basic Materials and Devices.

D. Dampers designed to operate with direct-coupled electric actuators with linkage concealed in frame (exposed linkage and jackshafts not acceptable), independent actuator for each damper section.

E. Do not link outdoor air and return air dampers. Each shall operate independently.

2.9 VIBRATION ISOLATION

A. Internally isolated.

B. Spring, 2 inch static deflection.

C. Comply with Section 230548 – Mechanical Sound and Vibration Control.

2.10 HOT AND CHILLED WATER COILS

A. Extended surface type coils.

1. Copper tubes.

a. Brazed or welded joints.
b. Minimum thickness: 0.020 inches.
c. Outside diameter: 1/2 inch or 5/8 inch.

2. Plate fins of aluminum, unless otherwise indicated on Drawings.

a. Minimum thickness: 0.0075 inches.

B. Rows and fin spacing.

1. To meet performance scheduled at similar pressure drop.
2. Selected with tube fouling factor of 0.0001.
3. Maximum fins: 10 per inch.
4. Select to avoid moisture carryover.

C. Circuiting: full row.

D. Headers: Copper tubing or cast iron.

E. Certified by ARI per current Standard 410.

F. For field installed coils, coil frame designed for bolting to other sections or ductwork.

G. Coil Casing.

1. Minimum 16-gauge.
2. 304 stainless steel casing and tube sheet.
3. Intermediate supports of same materials as casing.

H. Design for 200 pounds per square inch, 250 degrees Fahrenheit unless otherwise indicated on Drawings.

I. Factory tested to.

1. 300 psi for water coils.

J. Factory cleaned, degreased and flushed. Piping connections shall be capped with removable caps.

2.11 AUXILIARY CONTAINMENT PAN (UNDERNEATH AHU)

A. Provide fully welded stainless steel leak containment pan underneath AHU. Containment pan shall be sized to such that it extends 6 inches beyond the AHU on all sides with 6 inch high sides (completely around perimeter). Containment pan shall be sealed with waterproof protective coating.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Units shall ship with all openings securely covered and watertight. Protection shall be retained until completion of construction or until opening is field connected to ductwork.

C. Verify that adequate clearance between air handling units and adjacent walls or equipment is available to permit maintenance and repairs.

D. Provide auxiliary drain pans where required, see Section 233300 – “Air Duct Accessories.”

E. Provide accurate alignment between unit and connected ducts.

F. Install air handling units in accordance with manufacturer's written installation instructions.

G. Outdoor units shall be fully waterproof.

H. Mount units sufficiently high to allow for proper condensate trapping and drainage.

I. Piping.

1. See Section 232112 – "Heating and Cooling Piping."
2. See piping diagrams.
3. Do not block access doors with piping. Access doors shall be capable of opening 90 degrees.
4. Pipe condensate to nearest appropriate drain.

J. See Section 230900 – "Energy Management and Control System."

K. The Contractor shall be responsible to coordinate all installation requirements with other trades to ensure that a complete installation for each unit is being provided. Coordination efforts shall include such items as unloading and hoisting requirements, field wiring requirements, field piping requirements, field ductwork requirements, requirements for assembly of field-bolted or welded joints, and all other installation and assembly requirements.

L. The AHU manufacturer shall provide all screws and gaskets for joining of sections in the field.

M. The Contractor shall verify that the following items have been completed prior to scheduling the AHU manufacturer's final inspection and start up:

1. All spring-isolated components have had their shipping restraints removed and the components have been leveled.
2. On all field-joined units, that all interconnections have been completed, i.e., electrical and control wiring, piping, casing joints, bolting, welding, etc.
3. All water piping connections have been completed and hydrostatically tested and all water flow rates have been set in accordance with the capacities scheduled on the Drawings.
4. All ductwork connections have been completed and all ductwork has been pressure tested for its intended service.
5. All power wiring, including motor starters and disconnects, serving the unit has been completed.
6. All automatic temperature and safety controls have been completed.
7. All dampers are fully operational.
8. All shipping materials have been removed.
9. All (clean) filter media has been installed in the units.

3.2 INSPECTION

A. Verify that adequate clearance between air handling units and adjacent walls or equipment is available to permit maintenance and repairs.

3.3 PRE-OPERATING CHECKS

A. Before operating air handling units:

1. Complete provided Pre-Functional Test Data Sheet for each unit.

3.4 CLEANING

A. Clean modular air-handling units externally and internally, on completion of installation, according to manufacturer's written instructions. Clean fan interiors to remove foreign material and construction dirt and dust. Vacuum clean fan wheels, cabinets, and coils entering air face.

B. After completing system installation and testing, adjusting, and balancing modular air-handling and air-distribution systems, clean filter housings and install new filters.

3.5 TESTING AND ADJUSTING

A. Do not operate fans for any purpose, temporary or permanent until:

1. See Section 230500 – Basic Mechanical Materials and Methods.
2. Ductwork is clean.
3. Filters are in place.
4. Bearings are in place.
5. Bearings are lubricated.
6. Fan(s) has been run under observation.

B. Start and test fans in accordance with manufacturer's written installation instructions.

C. Test cooling coil drain pans. See Section 233300 – Duct Accessories.

D. Start-up and adjust completed air handling units to insure proper operation.

E. See Section 230593 – Testing, Adjusting, and Balancing.

F. After starting fans: Check for objectionable noise and/or vibration. Correct as needed at no additional cost to the Owner.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units.

B. See Section 230010 – Mechanical General Provisions.

END OF SECTION 23 73 13

SECTION 23 74 33

OUTDOOR-AIR HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes dedicated outdoor air units capable of supplying up to 100 percent outdoor air and providing cooling and heating.

1.3 SUBMITTALS

A. See Section 23 00 10 Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings (where shop and coordination drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Air handling units	R	R		R
Coils, performance data	R	R		R
Fans, performance data	R			
Acoustical performance data	R			
Motors	R	R		
Variable frequency drives	R	R		R
Dampers and actuators	R	R		
Filters	R			
Factory installed controls (controllers, control devices, etc.)	R	R		R
Accessories	R	R		R
Coordination drawings				R

C. Additional submittal requirements.

1. List of exceptions to the specifications including section number and a detailed description of alternative materials and methods. If there are no exceptions, so state in precise language.
2. List of proposed manufacturers for fans, filters, coils, motors, drives, dampers and other components.
3. Complete graph of fan curves (not just curve for design conditions) indicating efficiency, BHP, and RPM.
4. Sound power levels per ARI 260 by octave bands; radiated and at inlet and discharge.
5. Coil performance and flow rates.
6. Filter and filter frame product data.
7. Wiring diagram.
8. Control panel location, including elevation indicating height above the ground.
9. Internal static pressure drop with filters clean and dirty.
10. Casing materials of construction and methods of assembly.
11. Construction details including panel sealing, thermal break, door seal and hardware, shipping split and field treatment of panel penetration (sleeve) details.
12. The number of shipping sections requiring field reassembly.
13. Coordination Drawings: Submit with Shop Drawings. Show mechanical-room layout and relationships between components and adjacent structural and mechanical elements. Show service clearance requirements, and support locations, type of support, and weight on each support. Indicate and certify field measurements.

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: Two sets for each air-handling unit.
2. Gaskets: Two sets for each access door.
3. Fan Belts: One set for each air-handling unit fan.

1.5 QUALLITY ASSURANCE

A. Regulatory Requirements: Comply with provisions of the following codes:

B. UL Standard: Provide units complying with UL 1812, "Ducted Heat Recovery Ventilators"; or UL 1815, "Nonducted Heat Recovery Ventilators."

C. UL and NEMA Compliance: Provide ancillary electrical components required as part of energy recovery units that are listed and labeled by UL and that comply with applicable NEMA standards.

D. Comply with NFPA 70 for components and installation.

E. DX and water coils shall be AHRI Certified per standard 410-2001.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate size and location of equipment supports, housekeeping pad, and wall penetrations.

B. Coordinate construction sequencing of associated plumbing and electrical systems.

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to replace components of units that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Heat Exchangers: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

1. Greenheck.
2. Thybar.
3. Aaon.
4. Or equal.

2.2 DEDICATED OUTDOOR AIR UNITS

A. Surfaces in contact with the airstream shall comply with requirements of ASHRAE Standard 62.1-2010.

B. Unit Casing and Frames.

1. Double wall construction.
2. Unit shall be of internal frame type construction of G90 galvanized steel per ASTM A653.
3. Exterior panels shall be a minimum of 18 gauge galvanized steel. Where top panels are joined there shall be a standing seam.
4. All exterior metal-to-metal-seams shall be sealed with closed cell neoprene gasketing, requiring no caulking at job site.
5. Unit shall be furnished with a G90 galvanized base rail of sufficient height to install a condensate p-trap per manufacturer's recommendation. Minimum base rail height shall be 6". Units not provided with a factory fabricated base rail, a field constructed base rail shall be provided with same construction as factory fabricated base rail.
6. Contractor shall be responsible for providing a housekeeping pad.

C. Casing Insulation.

1. Rigid urethane foam.
2. Thickness: 1 inch (minimum).
3. Meets UL94HF-1 flame requirements.
4. Location and application: Full coverage of entire cabinet exterior to include walls, roof of unit. Insulation shall be installed between inner and outer shells of all cabinet exterior components.

D. Energy Recovery Wheel.

1. Wheel shall be of the enthalpy type for both sensible and latent heat recovery, and be designed to insure laminar flow.

2. Desiccant shall be silica gel.
3. Wheel shall be constructed of light weight polymer media.
4. Polymer media shall be mounted in a stainless steel rotor for corrosion resistance.
5. Wheel design shall consist of removable segments.
6. Segments shall be removable without the use of tools.
7. Silica gel desiccant shall be permanently bonded to wheel media.
8. Wheels with sprayed on desiccant coatings are not acceptable.
9. Pre-tensioned urethane drive belt.
10. Wheel performance criteria are to be as specified in AHRI Standard 1060, complying with the Combined Efficiency data in the submittal.
11. Modulating wheel defrost control (energy recovery wheel VFD).
12. Bypass dampers. See damper specifications herein.

E. Access Doors.

1. Hinged access doors.
2. All components shall be easily accessible through large hinged access doors for both exhaust and supply compartments.
3. Energy recovery wheel shall be mounted in a slide-out track.
4. Access doors to be provided in each individual section where blowers, filters and motorized damper are required.
5. Fabricated of 18 gauge G90 galvanized steel.

F. Fan Sections.

1. Centrifugal fans to be double width, double inlet, single fan forward curved type.
2. All blower wheels shall be statically and dynamically balanced.
3. Motors shall be permanently lubricated, heavy duty type, matched to the fan load and furnished at the specified voltage, phase and enclosure.
4. Ground and polished steel fan shafts shall be mounted in permanently lubricated, sealed ball bearing pillow blocks.
5. Bearings shall be selected for minimum (L10) life in excess of 100,000 hours at maximum cataloged operating speeds.
6. Blowers shall be quiet running, forward curved type and enable independent balancing of exhaust and supply airflows by providing separate motors for exhaust and supply blowers.
7. Fan and motor assembly shall be mounted on heavy gauge galvanized rails and internally isolated on 1.125 inch thick neoprene vibration isolators.
8. Blower performance shall be factory tested for flow rate, pressure, power, air density, rotation speed and efficiency. Ratings are to be established in accordance with AMCA 210, “Laboratory Methods of Testing Fans for Rating”.
9. Flexible duct connections.

G. Motor and Drives.

1. Premium efficiency, see 230513 Motors and Controllers. Inverter duty, suitable for use with variable frequency drive.
2. Motors shall be permanently lubricated, heavy duty type, matched to the fan load and furnished at the specified voltage, phase, and enclosure.
3. Drives shall be sized for a minimum of 150% of driven horsepower.
4. Pulleys shall be fully machine cast.
5. Energy recovery wheel motors shall have integral overload protection.
6. Supply and exhaust fan motor and enthalpy wheel controllers: Variable frequency drives, see Section 230513 Motor Controllers.

H. Dampers.

1. Motorized outdoor air intake and exhaust air dampers.
2. Low leakage type, factory installed. End/jamb seals and insulated blades.
3. Meet ASHRAE Standard 90.1-2010 damper leakage requirements.

I. Drain Pan.

1. Materials of Construction: Welded stainless steel.
2. Sloped in two directions.
3. Welded stainless steel drain connection.
4. Complies with ASHRAE Standard 62.1-2010.
5. P-trap per manufacturer's recommendation.

J. Filters.

1. 2" MERV 8 disposable filters.

K. Electrical.

1. All internal electrical components shall be prewired for single point power connection.
2. All electrical components shall be UL listed, approved or classified where applicable and wired in compliance with the National Electrical Code.
3. Single-point high voltage connection.

L. Direct Expansion (DX) Cooling/Heating Coil.

1. Factory tested and rated in accordance with AHRI 410.
2. Copper tubes with permanently expanded aluminum fins, 12 fpi or less.
3. Galvanized frame.
4. Interlaced configuration.

M. Hot Gas Reheat Coil.

1. Factory tested and rated in accordance with AHRI 410.
2. Copper tubes with permanently expanded aluminum fins, 12 fpi or less.
3. Galvanized frame.

N. Natural Gas Furnace.

1. Indirect gas-fired furnace.
2. Factory assembled, piped and wired complying with NFPA 54 and ANSI Z21.47.

    a. Furnace shall bear AGA label.

3. Burners: Stainless steel.

    a. Ignition: electronically controlled electric spark with flame sensor.

4. Stainless steel heat exchanger drain pan.
5. Power vent: integral, motorized centrifugal fan interlocked with gas valve.
6. Concentric vent kit.
7. 4:1 electronically modulating gas control valve.
8. Gas train: single-body, regulated, redundant, 24 VAC gas valve assembly containing pilot solenoid valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff.
9. Fabricate section to allow removal and replacement of furnace and to allow in-place access for service.

O. Unit Controls.

1. The unit shall be constructed so that it can function as a stand-alone heating and cooling system controlled by factory-supplied controllers, thermostats and sensors or it can be operated as a heating and cooling system controlled by an Energy Management and Control System (EMCS).
2. DDC controller with integral LCD screen and built-in keypad.
3. DDC controller communication protocol: BACnet MSTP.
4. Variable frequency drives (supply and exhaust fans, energy recovery wheel).
5. Unit shall be furnished with the following sensors, also See Drawings.

    a. Dirty filter sensors (supply and exhaust).
    b. CO2 sensor (duct mounted).
    c. Temperature sensors.

        1) Outdoor air entering wheel.
        2) Outdoor air leaving wheel.
        3) Outdoor air leaving cooling coil.
        4) Outdoor air supply air.
        5) Exhaust air entering wheel.
        6) Exhaust air leaving wheel.

    d. Pressure sensors.

        1) Outdoor air wheel pressure.
        2) Outdoor air filter pressure.
        3) Exhaust air wheel pressure.
        4) Exhaust air filter pressure.

    e. Current sensors.

        1) Supply fan.
        2) Exhaust fan.

    f. Energy recovery wheel rotation sensor.
    g. Phase monitor.
    h. Defrost control.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.

C. Examine roof curbs and equipment supports for suitable conditions where units will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's rigging and installation instructions for unloading units and moving to final locations.

B. Curb Support: Install roof curb on roof structure according to "The NRCA Roofing Manual."

1. Install and secure units on curbs and coordinate roof penetrations and flashing with roof construction.
2. Coordinate size, installation, and structural capacity of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 077200 "Roof Accessories."
3. Coordinate size, location, and installation of unit manufacturer's roof curbs and equipment supports with roof Installer.

C. Restrained Curb Support: Install restrained vibration isolation roof-curb rails on roof structure according to "The NRCA Roofing Manual."

D. Install wall- and duct-mounted sensors furnished by manufacturer for field installation. Install control wiring and make final connections to control devices and unit control panel.

E. Comply with requirements for gas-fired furnace installation in NFPA 54, "National Fuel Gas Code."

F. Install separate devices furnished by manufacturer and not factory installed.

G. Install new filters at completion of equipment installation and before testing, adjusting, and balancing.

H. Install drain pipes from unit drain pans to sanitary drain.

1. Drain Piping: Drawn-temper copper water tubing complying with ASTM B 88, Type L, with soldered joints.
2. Pipe Size: Same size as condensate drain pan connection.

3.3 CONNECTIONS

A. Where installing piping adjacent to units, allow space for service and maintenance.

B. Refrigerant piping: Refrigerant piping: Comply with applicable requirements in Section 232300 “Refrigerant Piping.”

C. Gas Piping Connections:

1. Comply with requirements in Section 231123 "Fuel Gas Piping."
2. Connect gas piping to furnace, full size of gas train inlet, and connect with union, pressure regulator, and shutoff valve with sufficient clearance for burner removal and service.
3. Install AGA-approved flexible connectors.

D. Duct Connections:

1. Comply with requirements in Section 233113 "Ducts."
2. Drawings indicate the general arrangement of ducts.

3. Connect ducts to units with flexible duct connectors. Comply with requirements for flexible duct connectors in Section 233300 "Duct Accessories."

E. Electrical Connections: Comply with requirements for power wiring, switches, and motor controls in electrical Sections.

1. Install electrical devices furnished by unit manufacturer but not factory mounted.

3.4 CLEANING

A. After completing system installation, including outlet fittings and devices, inspect and clean exposed finishes. Remove dirt and construction debris and repair damaged finishes.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Inspect units for visible damage to furnace combustion chamber.
3. Perform the following operations for both minimum and maximum firing and adjust burner for peak efficiency:

    a. Measure gas pressure at manifold.
    b. Measure combustion-air temperature at inlet to combustion chamber.
    c. Measure flue-gas temperature at furnace discharge.
    d. Perform flue-gas analysis. Measure and record flue-gas carbon dioxide and oxygen concentration.
    e. Measure supply-air temperature and volume when burner is at maximum firing rate and when burner is off. Calculate useful heat to supply air.

4. Verify operation of remote panel including pilot-light operation and failure modes. Inspect the following:

    a. High-limit heat exchanger.
    b. Alarms.

5. Start refrigeration system when outdoor-air temperature is within normal operating limits and measure and record the following:

    a. Cooling coil leaving-air, dry- and wet-bulb temperatures.
    b. Cooling coil entering-air, dry- and wet-bulb temperatures.
    c. Condenser coil entering-air dry-bulb temperature.
    d. Condenser coil leaving-air dry-bulb temperature.

6. Simulate maximum cooling demand and inspect the following:

    a. Compressor refrigerant suction and hot-gas pressures.
    b. Short-circuiting of air through outside coil or from outside coil to outdoor-air intake.

7. Inspect casing insulation for integrity, moisture content, and adhesion.
8. Verify that clearances have been provided for servicing.
9. Verify that controls are connected and operable.
10. Verify that filters are installed.

11. Clean coils and inspect for construction debris.
12. Clean furnace flue and inspect for construction debris.
13. Inspect operation of power vents.
14. Purge gas line.
15. Inspect and adjust vibration isolators.
16. Verify bearing lubrication.
17. Clean fans and inspect fan-wheel rotation for movement in correct direction without vibration and binding.
18. Adjust fan belts to proper alignment and tension.
19. Start unit.
20. Inspect and record performance of interlocks and protective devices including response to smoke detectors by fan controls and fire alarm.
21. Operate unit for run-in period.
22. Calibrate controls.
23. Adjust and inspect high-temperature limits.
24. Inspect outdoor-air dampers for proper stroke and interlock with return-air dampers.
25. Verify operational sequence of controls.
26. Measure and record the following airflows. Plot fan volumes on fan curve.

    a. Supply-air volume.
    b. Outdoor-air flow.

B. After startup, change filters, verify bearing lubrication, and adjust belt tension.

C. Remove and replace components that do not properly operate and repeat startup procedures as specified above.

D. Prepare written report of the results of startup services.

3.6 ADJUSTING

A. Adjust initial temperature and humidity set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. After starting units: Check for objectionable noise or vibration. Correct as needed at no additional cost to the Owner.

D. Balancing: See Section 230593 “Testing, Adjusting and Balancing for HVAC.”

E. Prepare test and inspection reports.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION 23 74 33

SECTION 23 81 29

SPLIT SYSTEM – MULIZONE VRF HEAT PUMP EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes variable refrigerant flow (VRF) system consisting of separate evaporator-fan coil units, heat recovery units (branch controllers), compressor-condenser components and system controls.

1.3 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Outdoor units	R	R		R
Indoor units	R	R		R
Heat recovery units (branch controllers)	R	R		R
System controls and accessories	R	R		R
Installer’s qualifications (factory training certificate)	R			

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: Five set(s) for each type of indoor unit.

1.5 QUALITY ASSURANCE

A. The VRF system installer must be factory-trained and certified prior to submission of bid. A factory-trained and certified employee of the installer must be on-site when HVAC system is being installed and placed in operation.

B. The lowest and best bidder is to provide a letter from the manufacturer verifying the training certification and a minimum of four (4) successful installations of specified VRF system with references within 72 hours of receipt of bid to Architect.

C. Product Options: Drawings indicate size, profiles, and dimensional requirements of equipment and are based on the basis of design system indicated.

D. The units shall be listed by Electrical Laboratories (ETL) and bear the ETL label.

E. All wiring shall be in accordance with the National Electrical Code (N.E.C.).

F. The units shall be manufactured in a facility registered to ISO 9001 and ISO 14001 which is a set of standards applying to environmental protection set by the International Standard Organization (ISO).

G. A full charge of R-410A for the condensing unit only shall be provided in the condensing unit.

H. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

I. ASHRAE Compliance:

1. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Standard for Refrigeration Systems."
2. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality," Section 5 - "Systems and Equipment," Section 6 - " Procedures," and Section 7 - "Construction and System Start-up."

J. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1.

1.6 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.

B. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.

1. Warranty Period:

a. For Compressor: Five years from date of Substantial Completion.

b. For Parts: Five years from date of Substantial Completion.
c. For Labor: One year from date of Substantial Completion.

B. The system shall be installed by a factory trained and manufacturer certified contractor with extensive training on this type equipment. Training to be performed and certification to be provided by the manufacturer. A completed system commissioning report shall be submitted to the Manufacturer's service department to ensure full warranty coverage for the Owner"

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. LG HVAC.
2. Mitsubishi HVAC.
3. Trane Co.
4. Daikin.
5. Or equal.

B. A Mitsubishi City Multi VRF system has been approved by the Owner and is the basis of design for this project. The piping systems, controls, electrical systems, drains, equipment space (including service space), and equipment capacities are as required by the Mitsubishi City Multi system. A bid based using any other equipment must also include the cost for the system design and installation which includes the additional or revised equipment, piping, electrical, supports, controls, and drains required for proper operation. Design must be prepared and documents sealed by a Architect Engineer registered in the State of Mississippi. The alternate system design must be approved by the Architect before executing the sub-contract. The Contractor shall assume all additional cost for design review, design revisions, controls, electrical, piping, and drains beyond those quantities required for City Multi.

2.2 OUTDOOR UNITS

A. General: The outdoor units shall be designed specifically for use with a variable refrigerant flow system and components. Units shall be equipped with multiple circuit boards that interface to the control system and perform all functions necessary for operation. The units shall have a powder coated finish and shall be completely factory assembled, piped and wired. Each unit must be run tested at the factory.

B. Unit Cabinets.

1. The casing shall be fabricated of galvanized steel, bonderized and finished with a powder coated baked enamel.

C. Fan.

1. The unit shall be furnished with one direct drive, variable speed propeller type fan.
2. The motor shall have inherent protection, permanently lubricated bearings, and be completely variable speed.
3. The fan shall be provided with a raised guard to prevent contact with moving parts.
4. The outdoor unit shall have a vertical discharge airflow.

D. Coil.

1. The condenser coil shall be of nonferrous construction with lanced or corrugated plate fins on copper tubing and shall be protected with an integral metal guard and shall be protected with an integral metal guard.
2. Refrigerant flow from the condenser shall be controlled by means of an inverter driven compressor.
3. The condenser coil shall include 4 circuits with two position valves for each circuit, except for the last stage.

E. Compressor.

1. The compressor shall be a high performance, inverter driven, modulating capacity scroll compressor with a factory mounted crankcase heater.
2. The outdoor unit shall have an accumulator with refrigerant level sensors and controls.
3. The outdoor unit shall have an inverter to modulate capacity. The capacity shall be completely variable down to a 16% of rated capacity.
4. The compressor shall be equipped with an internal thermal overload, a high pressure safety switch, over-current protection and DC bus protection.
5. The compressor shall be mounted to prevent the transmission of vibration.
6. The outdoor unit shall be capable of operating at 0 deg F ambient temperature without additional low ambient controls.
7. The outdoor unit shall have high efficiency oil separator plus additional logic controls to ensure adequate oil volume in the compressor is maintained.

F. Electrical.

1. The outdoor unit electrical power shall be 208 volts, 3 phase, 60 hertz.
2. The unit shall be capable of satisfactory operation within voltage limits of 198 volts to 253 volts.
3. The outdoor unit shall be controlled by integral microprocessors.
4. The control voltage between the indoor units and the outdoor unit shall be completed using a 2 conductor shielded cable to provide total integration of the system.

2.3 HEAT RECOVERY UNITS (BRANCH CONTROLLERS)

A. General: Heat recovery units (HRU) shall be designed specifically for use with a variable refrigerant flow system and components. These units shall be equipped with a circuit board that interfaces to the control system and shall perform all functions necessary for operation. The unit shall have a galvanized steel finish and shall be completely factory assembled, piped and wired. Each unit shall be run tested at the factory. The units shall be mounted indoors where indicated on the drawings. The sum of connected capacity of all indoor air handlers shall be as scheduled on the drawings. Each HRU shall operate the number of indoor units in accordance with the schedule on the drawings.

B. Unit Cabinet.

1. The casing shall be fabricated of galvanized steel.
2. Each cabinet shall house a liquid-gas separator and multiple refrigeration control valves.
3. The unit shall house a tube-in-tube heat exchanger.

C. Refrigerant Valves.

1. The unit shall be furnished with multiple two position refrigerant valves.

2. Each circuit shall have one (32,000 BTUH or smaller evaporator section) two-position liquid line valve and a two-position suction line valve.
3. The refrigerant connections shall be flare-type connections.
4. Linear electronic expansion valves shall be used to control the variable refrigerant flow.
5. Valves in the variable refrigerant flow system shall be Diamond Back VC series ball valves with HKG-20HF insulation kits or equal. Valve shall be a 700 psig Schrader valve for service connections. This valve kit shall be used with all systems.

D. Integral Drain Pan.

1. An integral condensate pan and drain shall be provided (if required by manufacturer).

E. Electrical.

1. The unit electrical power shall be 208 volts, 1 phase, 60 hertz.
2. The unit shall be capable of satisfactory operation within voltage limits of 198 volts to 254 volts.
3. The HRU shall be controlled by integral microprocessors.
4. The control voltage between the indoor units and the outdoor unit shall be communicated on a 2 conductor shielded cable.

2.4 RECESSED CEILING CASSETTE, DUCTLESS HEAT PUMPS INDOOR UNITS

A. General: The recessed ceiling cassette unit shall recess into the ceiling with a ceiling grille, an electronic expansion valve, controls that can be used with the outdoor unit and HRU. Each system shall perform in accordance to the ratings scheduled on the drawings.

B. Indoor Unit: The indoor unit shall be factory assembled, wired and run tested and shall contain within the unit all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, an emergency operation function and a test run switch. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory.

C. Unit Cabinet: A four-way grille shall be fixed to bottom of cabinet allowing, two, three, or four - way discharge.

D. Fan.

1. The evaporator fan shall be an assembly with a turbo fan direct driven by a single motor, be statically and dynamically balanced; fan motor shall have permanently lubricated bearings.
2. The indoor fan shall have four (4) speeds, High, Mid 1, Mid 2, and Low, two of which may be selected by the room controller.
3. The indoor unit shall have an adjustable air outlet system offering 4-way airflow, 3-way airflow, or 2-way airflow.
4. The auto air swing vanes shall be capable of automatically swinging up and down for uniform air distribution.

E. Filter.

1. Return air shall be filtered by means of a long-life permanent filter to provide approximately 2,500 hours of use in a normal office environment before cleaning.

F. Coil.

1. The evaporator coil shall be of nonferrous construction with smooth plate fins on copper tubing with inner grooves for high efficiency heat exchange.
2. All tube joints shall be brazed with phoscopper or silver alloy and shall be pressure tested at the factory.
3. A condensate pan and drain shall be provided under the coil.
4. The condensate pump shall be able to raise drain water 33 inches above the condensate pan.
5. Both refrigerant lines from the HRU to the indoor units shall be insulated.

G. Electrical.

1. The unit electrical power shall be 208 volts, 1 phase, 60 hertz.
2. The system shall be capable of satisfactory operation within voltage limits of 198 volts to 254 volts.

H. Controls.

1. This unit shall have controls provided by the manufacturer to perform input functions necessary to operate the system.

2.5 WALL-MOUNTED HEAT PUMP INDOOR UNITS

A. General: The indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, and a test run switch. Indoor unit and refrigerant piping shall be charged with dehydrated air before shipment from the factory.

B. Unit Cabinet.

1. The unit shall have multi-directional drain and refrigerant piping arrangements providing options for four (4) directions for refrigerant piping and two (2) directions for draining.
2. Unit shall have a separate back plate which secures the unit firmly to the wall.

C. Fan.

1. The evaporator fan shall be an assembly with one or two line-flow fan(s) direct driven by a single motor, be statically and dynamically balanced and run on a motor with permanently lubricated bearings.
2. A manual adjustable guide vane shall be provided with the ability to change the airflow from side to side (left to right).
3. A motorized air sweep louver shall provide an automatic change in airflow by directing the air up and down to provide uniform air distribution.
4. The indoor fan shall be capable of four (4) speeds, High, Mid 1, Mid 2, and Low, two of which may be selected by the room controller.

D. Filter.

1. Return air shall be filtered by means of an easily removable washable filter.

E. Coil.

1. The evaporator coil shall be of nonferrous construction with smooth plate fins on copper tubing with inner grooves for high efficiency heat exchange.
2. All tube joints shall be brazed with phoscopper or silver alloy and shall be pressure tested at the factory.
3. A condensate pan and drain shall be provided under the coil.
4. The condensate pump shall be able to raise drain water 33 inches above the condensate pan.
5. Both refrigerant lines from the HRU to the indoor units shall be insulated.

F. Electrical.

1. The unit electrical power shall be 208 volts, 1 phase, 60 hertz.
2. The system shall be capable of satisfactory operation within voltage limits of 198 volts to 254 volts.

G. Control.

1. The unit shall have controls provided by the manufacturer to perform input functions necessary to operate the system.

2.6 CONTROLS

A. Overview.

1. General: The control network shall consist of a centralized controller, software, and remote room controllers for each indoor unit.
2. The VRF system controls shall be capable of supporting remote controllers, centralized system controllers, and system integration to Energy Management and Control System (EMCS) via BACnet/IP.

B. VRF control system network.

1. The VRF control system shall consist of remote controllers, centralized controllers, and integrated web based interface communicating over a high-speed communication bus. The control system shall support operation monitoring, scheduling, error email distribution, personal browsers, tenant billing, online maintenance support, and integration to the EMCS via a BACnet/IP Gateway.

C. Remote indoor unit controllers.

1. Allows the user to change on/off, temperature setting, and fan speed setting. The room temperature shall be sensed at either the Remote Controller or the Indoor Unit dependent on the indoor unit dipswitch setting. The Remote Controller shall display a four-digit error code in the event of system abnormality/error.

D. Central controller.

1. The centralized VRF system controller shall be capable of controlling a minimum of 50 indoor units across multiple outdoor units. The centralized controller shall support operation superseding that of the remote controllers, system configuration, daily/weekly/annual scheduling, monitoring of operation status, error email notification, online maintenance tool and malfunction monitoring. The centralized controller shall have basic operation controls which can be applied to an individual indoor unit, a group of indoor units (up to 128 indoor units) or all indoor units (collective batch operation). This

basic control set of operation controls for the centralized controller shall include on/off, operation mode selection (cool, heat, auto, dry and fan), temperature setting, fan speed setting, airflow direction setting, error mail notification, and online maintenance. The centralized controller shall be able to enable or disable operation of local remote controllers. The centralized controller shall allow the user to define daily, weekly, and annual schedules with operations consisting of ON/OFF, mode selection, temperature setting, and permit/prohibit of remote controllers.

a. Centralized controller shall communicate with the VRF control system via a RS-485 daisy-chain communication protocol.
b. 10.2-inch backlit touchscreen LCD display screen.
c. Centralized controller shall allow web-access.
d. Support two digital input and two digital outputs for device interlocks.

E. VRF Control System Integration.

1. The BACnet interface shall be compliant with BACnet/IP (ANSI/ASHRAE 135, 135a) and UDP/IP of Ethernet (ANSI/ASHRAE 135-1005, 135b). The BACnet® interface shall support BACnet Broadcast Management (BBMD). The BACnet® interface shall support a minimum of 50 indoor units. Operation and monitoring points include, but are not limited to, on/off, operation mode, fan speed, prohibit remote controller, filter sign reset, alarm state, error code, scheduling, and error address.

2.7 ELECTRCIAL CHARACTERISTICS

A. General.

1. The controls network shall operate at 24VDC. Controller power and communications shall be via a common non-polar communications bus.

B. Wiring.

1. Control wiring shall be installed in a system daisy chain configuration from indoor unit to remote controller to indoor unit, to the HRU (main and subs, if applicable) and to the outdoor unit. Control wiring to remote controllers shall be run from the indoor unit terminal block to the controller associated with that unit.
2. Control wiring for schedule timers, system controllers, and centralized controllers shall be installed in a daisy chain configuration from outdoor unit to outdoor unit, to system controllers, to the power supply.
3. The central system controller shall be capable of being networked with other central system controllers for web based control.

C. Wiring Type.

1. Wiring shall be 2-conductor (16 AWG or 18 AWG), twisted shielded pair, stranded wire.
2. Network wiring shall be CAT-5e with RJ-45 connection.

2.8 POWER SUPPLY

A. The power supply shall supply 12VDC for the centralized controller and 24VDC voltage for the central control transmission. The power supply shall have the capacity to power a maximum of 2 centralized controllers.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install units level and plumb.

B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

C. Equipment Mounting:

1. Install ground-mounted, compressor-condenser components on cast-in-place concrete housekeeping pad.

D. Install and connect refrigerant piping to component's quick-connect fittings. Install tubing to allow access to unit.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where piping is installed adjacent to unit, allow space for service and maintenance of unit.

C. Duct Connections: Duct installation requirements are specified in Section 233113 "Metal Ducts." Drawings indicate the general arrangement of ducts. Connect supply and return ducts to split-system air-conditioning units with flexible duct connectors. Flexible duct connectors are specified in Section 233300 "Air Duct Accessories."

D. Connect condensate drain piping and extend condensate collection piping system.

E. Electrical: Comply with applicable requirements in Division 16 Sections for power wiring, switches, and motor controls.

3.3 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace malfunctioning units and retest as specified above.

C. Prepare test and inspection reports.

3.4 ADJUSTING

A. Adjust initial temperature and humidity set points.

3.5 CLEANING

A. After completing installation, clean furnaces internally according to manufacturer's written instructions.

B. Install new filters in each indoor unit prior to performing Testing, Adjusting, and Balancing work.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Final Checks before Startup: Perform the following:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to piping, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Perform cleaning and adjusting specified in this Section.

C. Provide all technical assistance required to Division 23C Energy Management and Controls contractor in mapping across points to the EMCS.

3.7 CLEANING

A. Clean indoor and outdoor units on completion of installation, according to manufacturer’s written instructions.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain Variable Refrigerant Flow Systems. Refer to Division 23 Section 230010 “Mechanical General Provisions”.

END OF SECTION 23 81 29

SECTION 23 81 23

COMPUTER-ROOM AIR CONDITIONERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for all water pumps except

1. Computer-Room Air-Conditioners
2. Controls and accessories

B. Related Sections

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 05 00 – Basic Mechanical Materials and Methods
3. Section 23 07 00 – Mechanical Insulation

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE Compliance:

1. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Standard for Refrigeration Systems."

C. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2010.

D. ASME Compliance: Fabricate and label water-cooled condenser shell to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," Division 1.

1.4 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Computer-Room Air Conditioner (color sample)	R	R	R	R
Controls (factory and field mounted)	R	R		
Accessories	R	R		
Mounting details				R

1.5 COORDINATION

A. Coordinate layout and installation of computer-room air conditioners and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

B. Coordinate installation of computer-room air conditioners with computer-room access flooring Installer.

C. Coordinate sizes and locations of equipment supports with actual equipment provided.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of computer-room air conditioners that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Compressors: Manufacturer's standard, but not less than five years from date of Substantial Completion.
2. Warranty Period for Humidifiers: Manufacturer's standard, but not less than five years from date of Substantial Completion.
3. Warranty Period for Control Boards: Manufacturer's standard, but not less than five years from date of Substantial Completion.

1.7 EXTRA MATERIIALS

A. Furnish one set of extra filters for each unit. Package with protective covering for storage and identified with labels describing contents.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

1. Data Aire
2. Liebert
3. Stulz

2.2 GENERAL

A. Self-contained, factory assembled, prewired, and prepiped; consisting of cabinet, coils, humidifier, fan, filters, and controls; for vertical floor mounting in upflow configuration.

2.3 CABINET AND FRAME

A. Frame shall be constructed of welded 16 gauge tubular steel, braced for rigidity, supporting mechanical equipment. Frame shall be coated with a corrosion inhibiting finish.

B. Unit shall be provided with complete front, rear and side access via heavy duty hinged steel doors. Doors shall be fabricated of 18 gauge steel. Quarter turn door latches shall be manually actuated via a hand tool. Door gaskets shall be polyurethane to prevent air leakage.

C. Unit shall have powder coated exterior finish. Finish shall prevent corrosion. Unit color shall be by the Professional.

D. Unit Insulation: Thermally and acoustically insulate cabinet interior with 1-inch thick, 1-1/2-pound density fiber insulation.

E. Condensate Drain Pan: Constructed of stainless steel and constructed per ASHRAE Standard 62.1-2010.

2.4 FAN SECTION

A. The supply air fans shall be single width, single inlet plenum fan with backward inclined blades. Fan wheel shall be directly connected to its motor. Fan/motor assembly shall be statically and dynamically balanced for quiet, vibration-free operation.

B. The fan motor shall be an electronically commutated (EC) synchronous DC motor; having soft start capability and shall be controlled via the unit mounted controller and automatically regulated through all modes of operation; independent of valve modulation.

C. Each fan shall have fault monitoring circuitry and integral speed controller for a level of redundancy.

D. The fan shall be mounted within the unit and fully enclosed in a sheet metal enclosure to prevent access to moving parts.

E. The system shall be designed for draw through air arrangement to ensure even air distribution to the entire face of the coil.

F. In the event of a fan failure, the remaining fans will automatically increase in speed to temporarily deliver as much air flow as possible to the controlled space until the failed fan can be repaired or replaced.

2.5 CHILLED WATER COOLING COIL

A. Arrangement: The chilled water cooling coil shall be in an “A” frame arrangement.

B. Coils: Shall be constructed of seamless copper tubes expanded into enhanced style aluminum fins.

C. Face Velocity: Shall be less than 500 feet per minute.

D. Maximum Working Pressure: Shall be 300 PSI.

E. Drain Pan: Coil shall sit in a stainless steel drain pan sloped for drainage. A properly sized condensate drain trap shall be furnished by manufacturer and externally piped by the installing contractor.

2.6 MODULATING CONTROL VALVE

A. Chilled water flow shall be controlled by a 3-way modulating control valve with characterized flow disk for accurate temperature control and dehumidification. The unit microprocessor shall position the valve in response to room conditions.

B. The valve shall be designed for up to 400 PSI water pressure.

2.7 FILTRATION

A. The filter chamber shall be an integral part of the system, designed within the unit for easy front accessibility.

B. An initial set of filters shall be factory installed in the unit.

C. Filters shall be 4-inch deep, disposable, pleated design, extended-surface, nonwoven, reinforced cotton fabric; supported and bonded to welded-wire grid; enclosed in cardboard frame design.

D. Rated not less than MERV 8 per ASHRAE Standard 52.2.

E. A filter differential switch for alarm activation shall be included.

2.8 ELECTRICAL

A. All electrical components, including contactors, relays and control transformers shall be pre-wired and contained in a unit-mounted electrical enclosure with piano-hinged door that shall swing out for easy access and servicing.

B. The control circuit voltage shall be 24 volts AC.

C. The input electrical power shall be as detailed on the project plans and schedule.

2.9 HUMIDIFIER

A. The unit shall be provided with a self-contained, microprocessor-controlled steam generator type humidifier. The steam generating humidifier shall use disposable cylinder type with electronic controls.

B. The humidifier shall discharge pure steam with no material dust carry-over and have a self-regulating automatic flush cycle. Cylinders shall be disposable not requiring cleaning or maintenance. The humidifier fill level, water conductivity and flush rate shall automatically adapt, both in frequency and duration, to variations in the incoming water.

C. Fully modulating to provide gradual 0 to 100 percent capacity with field-adjustable maximum capacity; with high-water probe.

D. Drain duration and drain interval shall be field-adjustable.

E. The capacity and power consumption shall be as detailed on the project plans and schedule.

2.10 WATER DETECTION SENSOR

A. Each unit shall be provided with one (1) water under floor detection sensor.

B. The solid-state water sensor shall be mounted under the unit by the installing contractor to sense the presence of water.

C. The water detector shall become an integral part of the microprocessor panel and shall display "WATER DETECTED IN UNDER FLOOR AREA" message and activate an audible alarm when the sensor is activated.

D. Additionally, three (3) adjustable action settings shall be available when an alarm is detected: Alarm only, shutdown unit or lockout compressor.

2.11 HIGH TEMPERATURE SENSOR

A. The high temperature sensor (Firestat) shall be factory-installed in the unit and shall be factory-set to 125 ºF. It shall immediately shut down the environmental control system when activated. The sensor shall be mounted with the sensing element in the return air.

2.12 MICROPROCESSOR CONTROL SYSTEM

A. The environmental control system shall be furnished with a microprocessor based panel. The panel shall include unit control functions and display normal functions and service diagnostics on a backlit liquid crystal display (LCD). The panel shall allow recall and display of the high and low temperature for the last 24 hours, high and low humidity for the last 24 hours, current percent of capacity and average percent of capacity for the last hour of operation for chilled water valve (if applicable), compressor (if applicable), reheat, humidification, dehumidification, component runtimes (if applicable) for fan motor(s), reheat, humidification, dehumidification and chilled water valve. Programming shall have multilevel password access to prevent unauthorized access. Programming shall be accomplished entirely from the front of the unit without the need to access, set or program switches inside the unit (front door of the unit does not need to be opened). Programmable functions shall be entered on flash memory to ensure program retention should power fail. The historical database shall be maintained by battery backup. Multiple messages shall be displayed by automatically scrolling from each message to the next. Alarm conditions shall be displayed by automatically scrolling from each message to the next. Alarm conditions, in addition to being displayed, shall enunciate an audible alarm. Four programmable summary contacts shall be available for remote alarm monitoring. Additional test or service terminal shall not be required for any functions. The control shall include temperature anticipation, moisture level humidity control and automatic flush cycles.

B. An alarm condition shall continue to be displayed until the malfunction is corrected. Multiple alarms shall be displayed sequentially in order of occurrence and only those alarms which have not been acknowledged shall continue to sound an audible alarm. The panel shall perform an automatic self-test on system start-up. A user accessible diagnostic program shall aid in system component trouble shooting by displaying on the unit LCD screen the name of the controlled item, output relay number, terminal plug and pin number for each controlled item.

C. The control system shall support communication with a BACnet MS/TP Energy Management and Control System (EMCS). See Section 23 09 00 Energy Management & Control System.

2.13 ADDITIONAL REQUIREMENTS

A. Thru-Door Locking Disconnect Switch: The environmental control unit shall include a non-automatic disconnect switch mounted in the high voltage section of the electrical panel. The operating mechanism shall prevent access to the high voltage electrical components until switched to the "OFF" position. The operating mechanism shall protrude through the exterior door and be lockable in the OFF position.

B. Condensate Pump: Units shall be provided with dual float condensate pump. If condensate pump fails control panel shall enunciate an alarm and display. Pumps shall be factory mounted/wired and shall include sump, motor, and automatic control. A factory installed high condensate water level alarm switch will disable the unit prior to condensate pan overflow should the drain become plugged with debris. The audio alarm is activated and a “High Condensate Water Level” message shall be displayed on the display module. The pumps shall be rated for 130 GPH at 20 foot of water maximum head (or 40 GPH at 20 foot of water maximum head with check valve).

C. Modulating Humidifier: The environmental control unit shall be provided with a modulating humidifier feature which matches its output to the signal from the humidity control of the unit controller.

D. Smoke Detector: The environmental control unit shall be provided with a smoke detector. The smoke detector shall be mounted with the sensing element in the return air stream. When the smoke detector is activated, it shall immediately shut down the unit.

E. No Water Flow Alarm: Unit shall be furnished with a NEMA 1 flow switch for field mounting into the chilled water piping to the unit. Upon a loss of water flow the unit control panel shall indicate “No Water Flow” and alarm shall sound.

F. Remote Temperature & Humidity Sensors: Units shall be provided with remote temperature and humidity sensor. The sensor shall be provided in a plastic case for remote mounting. Cable shall be provided for field wiring in 35 length.

G. Phase Loss Relay: Phase loss relay is used to shut down the environmental control unit on the loss of any phase of power. Three phase (3-Ph) equipment only. Automatic reset.

H. Floor Stand: Down flow unit(s) shall be provided with floorstand and vibration isolation pads. The floorstand shall be a completely welded structural angle base frame engineered to support the operating unit. The floorstand height shall be verified and shall have adjustable legs

I. Floor Stand Turning Vane: A factory-supplied, field-mounted turning vane shall be provided.

J. Vibration Isolation Pads: Vibrations isolation pads consisting of high density cork sandwiched between two layers of neoprene shall be supplied for field mounting.

K. Hot Water Reheat: Reheat will be provided by hot water coil with copper tubes and aluminum fins rated for a maximum working pressure of 300 PSI (20 bar). Reheat circuit shall include a factory mounted 2-way hot water valve for temperature control. Coil, control valve and controls as required for a functioning system shall be factory mounted.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades

B. Contractor to examine the areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

C. Provide access space around equipment for service. Provide no less than minimum as recommended by manufacturer

D. Examine roughing-in for hydronic piping systems to verify actual locations of piping connections before equipment installation.

E. Examine walls, floors, and roofs for suitable conditions where equipment will be installed.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

G. Install precision cooling units in accordance with manufacturer’s installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer’s recommended clearances.

H. Install in conjunction with server cabinets for integrated line up of equipment.

3.2 CONNNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties. Provide all piping, fittings, and additional specialties required by manufacturer.

B. Piping Connections: Connect equipment furnished by manufacturer but not specified to be factory-mounted. Furnish copy of manufacturer’s piping connection diagram submittal to piping contractor. Install piping to allow proper service and maintenance.

C. Electrical Wiring: Install and connect electrical devices furnished by manufacturer but not specified to be factory mounted. Furnish copy of manufacturer’s electrical connection diagram submittal to electrical contractor.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, start-up and adjust components, assemblies, and equipment installations, including connections.

B. Perform manufacturer’s required tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing

3.4 TESTING AND ADJUSTING

A. See Section 23 05 93 – Testing, Adjusting, and Balancing

3.5 TRAINING

A. See Sections 23 00 10 – Mechanical General Provisions

B. Engage a factory-authorized service representative to train Owner's maintenance personnel on:

1. Procedures for starting and stopping and troubleshooting units
2. Procedures and schedules for maintaining and servicing units
3. Organization and content of Operations & Maintenance Manuals

END OF SECTION 23 81 23

SECTION 23 36 00

AIR SOURCE UNITARY DUCTLESS SPLIT-SYSTEM HEAT PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Ductless split-system heat pumps.

1.3 REFERENCE STANDARDS

A. AHRI Standard 210/240 – Performance Rating of Unitary Air-Conditioning & Air-Source Heat Pump Equipment.

B. U.S. Environmental Protection Agency – Energy Star Products.

1.4 SUBMITTALS

A. See Section 230010 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
DSS outdoor units	R	R		R
DSS indoor units	R	R		R
DSS controls and accessories	R	R		

1.5 QUALITY ASSURANCE

A. Ductless split-system heat pumps rated and certified in accordance with AHRI Standard 210/240.

B. Ductless split-system heat pumps Energy Star rated.

C. Product Options: Drawings indicate size, profiles, and dimensional requirements of split-system units and are based on the specific system indicated. Other manufacturers' systems with equal performance characteristics may be considered. Refer to Division 01 Section "Substitutions."

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.6 WARRANTY

A. General Warranty: Special warranty specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Special Warranty: Written warranty, executed by manufacturer agreeing to repair or replace components of split-system heat pump units that fail in materials or workmanship within specified warranty period.

C. Warranty Period: Five years from date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

1. LG Electronics.
2. Mitsubishi.
3. Trane.

2.2 WALL-MOUNTED HEAT PUMP INDOOR UNITS

A. General: The indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, and a test run switch. Indoor unit and refrigerant piping shall be charged with dehydrated air before shipment from the factory.

B. Unit Cabinet:

1. The unit shall have multi-directional drain and refrigerant piping arrangements providing options for four (4) directions for refrigerant piping and two (2) directions for draining.
2. Unit shall have a separate back plate which secures the unit firmly to the wall.

C. Fan:

1. The evaporator fan shall be an assembly with one or two line-flow fan(s) direct driven by a single motor, be statically and dynamically balanced and run on a motor with permanently lubricated bearings.
2. A manual adjustable guide vane shall be provided with the ability to change the airflow from side to side (left to right).
3. A motorized air sweep louver shall provide an automatic change in airflow by directing the air up and down to provide uniform air distribution.
4. The indoor fan shall be capable of four (4) speeds, High, Mid 1, Mid 2, and Low, two of which may be selected by the room controller.

D. Filter:

1. Return air shall be filtered by means of an easily removable washable filter.

E. Coil:

1. The evaporator coil shall be of nonferrous construction with smooth plate fins on copper tubing with inner grooves for high efficiency heat exchange.
2. All tube joints shall be brazed with phoscopper or silver alloy and shall be pressure tested at the factory.
3. A condensate pan and drain shall be provided under the coil.
4. The condensate pump shall be able to raise drain water 33 inches above the condensate pan.

F. Electrical:

1. The unit electrical power shall be 208 volts, 1 phase, 60 hertz. (Contractor shall be responsible for coordinating unit electrical characteristics with actual site electrical service.)

G. Control:

1. The unit shall have controls provided by the manufacturer to perform input functions necessary to operate the system.

2.3 AIR-COOLED, COMPRESSOR-CONDENSER COMPONENTS

A. Casing: Steel, finished with baked enamel, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.

B. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.

1. Compressor Type: DC inverter driven twin rotary with manual-reset high-pressure switch and automatic-reset low-pressure switch.

C. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with liquid subcooler.

D. Heat Pump Components: Reversing value and low-temperature air cut-off thermostat.

E. Fan: Aluminum-propeller type, directly connected to motor.

F. Motor: Permanently lubricated, with integral thermal-overload protection.

G. Low Ambient Kit: Permits operation down to 0 ˚F.

H. Mounting Base: Polyethylene.

2.4 ACCESSORIES

A. Thermostat: Remote, hard-wired control compressor and evaporator fan, with the following features:

1. Status monitoring.
2. Seven day programming of system stop and start.
3. Liquid-crystal display indicating mode, temperature, set-point temperature, indoor temperature, time setting, operating mode, fan speed, air-flow direction, filter sign and error alarm and code.
4. Fan-speed selection, including auto setting.

B. Automatic-reset timer to prevent rapid cycling of compressor.

C. Diamondback refrigerant line sets (or equal) with flared fittings, each end preinsulated.

D. Refrigerant Valves and Piping:

1. Valves in the variable refrigerant flow system shall be Diamondback BV series ball valves (or equal) with HKG-20HF insulation kits (or equal). Valve shall be a 700 psig Schrador valve for service connections. This valve kit shall be used with all systems.
2. Refrigerant piping between outdoor units and indoor units shall be pre-charged, preinsulated, copper line sets provided by the equipment manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Install all system components in accordance with manufacturer’s written installation instructions.

C. Provide access space around indoor and outdoor units for service. Provide no less than minimum as recommended by manufacturer.

D. Install units level and plumb.

E. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to unit to allow service and maintenance.

C. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Installation Inspection: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections, and to prepare a written report of inspection.

B. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

C. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new components, and retest.

D. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.4 COMMISSIONING

A. Engage a factory-authorized service representative to perform startup service.

B. Verify that units are installed and connected according to the Contract Documents.

C. Lubricate bearings, adjust belt tension, and change filters.

D. Perform startup checks according to manufacturer's written instructions and do the following:

1. Fill out manufacturer's checklists.
2. Check for unobstructed airflow over coils.
3. Check operation of condenser capacity-control device.
4. Verify that vibration isolation devices and flexible connectors dampen vibration transmission to structure.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain units.

1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining units. See Section 230010 “Mechanical General Provisions.”
2. Review data in maintenance manuals. Refer to Section 230010 “Mechanical General Provisions.”

END OF SECTION 23 81 43

SECTION 237313 – FAN COIL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Fan coil units.

1.3 REFERENCE STANDARDS

A. AMCA 99 – Standards Handbook.

B. AMCA Standard 203.

C. ANSI/AMCA 210 – Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.

D. ANSI/AMCA 230 – Laboratory Methods of Testing Air Circulator Fans for Rating.

E. AMCA 300 – Reverberant Room Method of Sound Testing of Fans.

F. AMCA Standard 301 – Method for Calculating Fan Sound Ratings from Laboratory Test Data.

G. AMCA Standard 500-D – Laboratory Methods of Testing Dampers for Rating.

H. AMCA 500-L – Laboratory Methods of Testing Louvers for Rating.

I. ARI 410 – Standard for Forced – Circulation Air-Cooling and Air Heating Coils.

J. ANSI/AFBMA 9 – Load Ratings and Fatigue Life for Ball Bearings.

K. ANSI/AFBMA 11 – Load Ratings and Fatigue Life for Roller Bearings.

L. ASHRAE/ANSI Standard 111.

M. ASHRAE Standard 52.

N. ASTM A525 – Specification for General Requirements for Steel Sheet, Zinc Coated (Galvanized) by the Hot-Dip Process.

O. NFPA 90A – Installation of Air Conditioning and Ventilation Systems.

P. SMACNA – Low Pressure Duct Construction Standards.

Q. UL Standard 1995.

1.4 QUALITY ASSURANCE

A. AMCA certified ratings per applicable AMCA standard based on the testing conducted in an independent laboratory.

B. Conform to AMCA Bulletins regarding construction and testing. Fans shall bear AMCA certified rating seal for both sound and performance.

C. Units shall be designed and manufactured in strict accordance with UL 1995, Standard for Heating and Cooling Equipment. Air handler shall be ETL or UL listed in accordance with UL 1995, or the current equivalent by UL, and shall carry the ETL or UL label. If manufacturer cannot provide ETL/UL sticker on air handler, it will be the sole responsibility of the contractor to arrange for local, on-site, ETL or UL approval and labeling at no additional cost to the Owner.

D. Schedule equipment performance is minimum capacity required.

1.5 SUBMITTALS

A. See Section 23 00 10 Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings (where shop and coordination drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Fan coil units	R	R		R
Coils, performance data	R	R		R
Fans, performance data	R			
Acoustical performance data	R			
Motors	R	R		
Dampers and actuators	R	R		
Filters	R			
Factory installed controls	R	R		R
Accessories	R	R		R
Coordination drawings				R

C. Fan Coil Units.

1. Complete graph of fan curves (not just curve for design conditions) indicating efficiency, BHP, and RPM.
2. Sound power levels per ARI 260 by octave bands; radiated and at the inlet and discharge.
3. Coil performance and flow rates.
4. Filter and filter frame product data.

5. Casing materials of construction and methods of assembly.
6. Complete dimensional data including exterior dimensions and dimensions of internal components.
7. Coordination Drawings: Submit with Shop Drawings. Show mechanical-room layout and relationships between components and adjacent structural and mechanical elements. Show service clearance requirements, and support locations, type of support, and weight on each support. Indicate and certify field measurements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models are acceptable.

1. Daikin.
2. Trane.
3. York/Johnson Controls.
4. Or equal.

2.2 GENERAL

A. Fan and coil capacity as scheduled on Drawings.

2.3 CABINETS

A. Material.

1. External: polyurethane based powder coated A60 galvanized steel.
2. Internal: G90 galvanized steel.

B. Cabinet.

1. Vertical Unit Front Panels: Removable, 16 gauge steel, with extruded aluminum double deflection discharge grille and channel-formed edges, cam fasteners, and insulation on back of panel.
2. Horizontal Unit Bottom Panels: Fastened to unit with cam fasteners, tamperproof screws, hinge, and attached with safety chain; with extruded aluminum return grilles. Telescoping panel to allow the panel to be adjusted to line up flush with the ceiling.
3. Steel recessing flanges for recessing fan-coil units into ceiling or wall.

C. Units shall pass 500 hour salt spray test as described in ASTM B-117.

D. Access panels shall permit full access to internal components. Structural integrity shall remain unaffected by the removal of any or all access panels.

E. Insulation.

1. 0.5 inch 1.5 pound density fiberglass.
2. Foil facing on airstream surface.

3. Protected such that coil condensate shall not be in contact with insulation under any expected operation condition.

2.4 DRAIN PAN

A. Main and auxiliary drain pans.

B. Sloped for positive drainage.

C. Heavy gauge Type 304 stainless steel.

2.5 FAN SECTION

A. Double width, double inlet, forward curved, centrifugal type.

B. Statically and dynamically balanced for smooth, quiet operation.

C. Bearings.

1. Self-aligning, sealed cartridge, permanently lubricated ball bearings.
2. Rubber mounted.
3. Rated for an average life of 200,000 hours.

D. Fan shaft: Solid cold rolled steel designed such that its operating speed is below its first critical speed.

E. Motors.

1. Comply with Section 230513 – Motors and Controllers.
2. Where Scheduled on Drawings.

    a. Electrically commutated motor (ECM).
    b. Programmed with fan curve for “constant airflow” (where constant volume specified).
    c. Controller to accept 0-10 Vdc signal from EMCS to vary cfm setpoint proportional to signal; less than 2 Vdc signal to shut motor off.

F. Belt Drives (where scheduled).

1. V-belt type.
2. Variable pitch motor sheaves.
3. Blower sheave: Cast iron single groove with split tapered bushing that is keyed to the blower shaft.

2.6 FILTER SECTION

A. Filter type as scheduled.

B. Comply with Section 234000 – Cleaning Devices.

C. Hinged side access door.

2.7 HOT AND CHILLED WATER COILS

A. Extended surface type coils.

1. Copper tubes.

a. Brazed or welded joints.
b. Minimum thickness: 0.020 inches.
c. Outside diameter: 1/2 inch or 5/8 inch.

2. Plate fins of aluminum, unless otherwise indicated on Drawings.

a. Minimum thickness: 0.0075 inches.

B. Rows and fin spacing.

1. To meet performance scheduled at similar pressure drop.
2. Selected with tube fouling factor of 0.0001.
3. Maximum fins: 10 per inch.
4. Select to avoid moisture carryover.

C. Circuiting: full row.

D. Headers: Copper tubing or cast iron.

E. Certified by ARI per current Standard 410.

F. For field installed coils, coil frame designed for bolting to other sections or ductwork.

G. Coil Casing.

1. Minimum 16-gauge.
2. 304 stainless steel casing and tube sheet.
3. Intermediate supports of same materials as casing.

H. Design for 200 pounds per square inch, 250 degrees Fahrenheit unless otherwise indicated on Drawings.

I. Factory tested to.

1. 300 psi for water coils.

J. Factory cleaned, degreased and flushed. Piping connections shall be capped with removable caps.

2.8 AUXILIARY CONTAINMENT PAN (UNDERNEATH FCU)

A. Provide fully welded galvanized leak containment pan underneath FCU. Containment pan shall be sized to such that it extends 6 inches beyond the FCU on all sides with 6 inch high sides (completely around perimeter). Containment pan shall be sealed with waterproof protective coating.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Units shall ship with all openings securely covered and watertight. Protection shall be retained until completion of construction or until opening is field connected to ductwork.

C. Verify that adequate clearance between air handling units and adjacent walls or equipment is available to permit maintenance and repairs.

D. Provide auxiliary drain pans where required, see Section 233300 – Duct Accessories.

E. Provide condensate pump where scheduled. See Section 233300 – Duct Accessories.

F. Provide accurate alignment between unit and connected ducts.

G. Install fan coil units in accordance with manufacturer's written installation instructions.

H. Mount units sufficiently high to allow for proper condensate trapping and drainage.

I. Piping.

1. See Section 232113 – "Hydronic Piping."
2. See piping diagrams.
3. Do not block access doors with piping. Access doors shall be capable of opening 90 degrees.
4. Pipe condensate to nearest appropriate drain.

J. See Section 230900 – "Energy Management and Control System."

K. The Contractor shall be responsible to coordinate all installation requirements with other trades to ensure that a complete installation for each unit is being provided. Coordination efforts shall include such items as unloading and hoisting requirements, field wiring requirements, field piping requirements, field ductwork requirements, requirements for assembly of field-bolted or welded joints, and all other installation and assembly requirements.

3.2 INSPECTION

A. Verify that adequate clearance between air handling units and adjacent walls or equipment is available to permit maintenance and repairs.

3.3 PRE-OPERATING CHECKS

A. Before operating air handling units:

1. Complete provided Pre-Functional Test Data Sheet for each unit.

3.4 CLEANING

A. Clean fan coil units externally and internally, on completion of installation, according to manufacturer's written instructions. Clean fan interiors to remove foreign material and construction dirt and dust. Vacuum clean fan wheels, cabinets, and coils entering air face.

B. After completing system installation and testing, adjusting, and balancing modular indoor air-handling and air-distribution systems, clean filter housings and install new filters.

3.5 TESTING AND ADJUSTING

A. Do not operate fans for any purpose, temporary or permanent until:

1. See Section 230500 – Basic Mechanical Materials and Methods.
2. Ductwork is clean.
3. Filters are in place.
4. Bearings are in place.
5. Bearings are lubricated.
6. Fan(s) has been run under observation.

B. Start and test fans in accordance with manufacturer's written installation instructions.

C. Test cooling coil drain pans. See Section 233300 – Duct Accessories.

D. Start-up and adjust completed air handling units to insure proper operation.

E. See Section 230593 – Testing, Adjusting, and Balancing.

F. After starting fans: Check for objectionable noise and/or vibration. Correct as needed at no additional cost to the Owner.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units.

B. See Section 230010 – Mechanical General Provisions.

END OF SECTION 23 73 13

SECTION 23 82 39

UNIT HEATERS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following: All air terminal units including

1. Gas-fired, power-exhausted.
2. Propeller unit heaters with electric-resistance heating coils.
3. Wall and ceiling heaters with propeller fans and electric-resistance heating coils.

B. Related Sections

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Unit heaters	R	R		R
Unit heater controls	R	R		
Accessories	R	R		

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

C. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Gas-Fired Unit Heater

1. Modine
2. Reznor
3. Trane

C. Electric Unit Heaters

1. Indeeco
2. Markel
3. Trane

2.2 GAS-FIRED UNIT HEATERS

A. General

1. Conforming to ANSI Z83.8 standard for “Gas Unit Heater and Gas-Fired Duct Furnaces” for safe operation, construction and performance.
2. Casing

    a. 20 gauge aluminized steel
    b. Painted with electrostatically applied baked-on polyester powder pain 7-mil thickness.
    c. Provide horizontal air deflectors

3. Efficiency

    a. 80% minimum efficiency provided by an indirect-fired heat exchanger.

4. Venting Arrangement

    a. Powered exhaust
    b. Factory test unit to insure proper ignition when it is subjected to 40 mph wind velocities.
    c. Factory mounted differential pressure switch designed to prevent main burner ignition.
    d. Venting materials and arrangement shall be per manufacturer’s recommendations.

5. Furnace Section

a. 20 gauge aluminized steel tubes
b. The ignition controller shall be 100% shut-off with continuous retry.
c. Gas pressure between 6-7".

6. Electrical

a. All electrical components shall carry UL or ETL listing.
b. A low voltage terminal board shall be provided for direct wiring connection to an external thermostat
c. Single step down transformer shall be provided for all unit controls.

7. Accessories:

a. Suspension kit
b. Thermostat

2.3 ELECTRIC UNIT HEATERS

A. General

1. Casings

a. Fabricated of die formed 18 gauge welded steel and finished with durable powder coated paint
b. Stamped louver periphery inlet grill
c. Adjustable louvers and outward drawn venture
d. Control compartment with master terminal board and hinged and latched access door. Quarter turn fasteners

2. Elements

a. Steel tubes with Nickel-Chromium resistance wire embedded in compacted efficient dielectric
b. Steel helical fins, machine crimped and brazed to tube

3. Motor

a. Totally enclosed
b. Single phase with voltage rating same as heater voltage rating
c. Single-speed units: 1 Phase permanently lubricated thermal protected unit bearing motor.
d. Two-speed units: 1 Phase thermally protected motors with sleeve bearings
e. Sleeve bearing motors lubricated for 5 years continuous or 10 year intermittent use.

4. Wiring

a. Single circuit with elements, motor and control circuits wired in accordance with latest National Electric Code and UL Standard 2021.

5. Limit Controls

a. Built in fan purge to dissipate residual heat from elements upon heater shutdown
b. Automatic reset thermal cutout to shutdown elements and fan motor if safe

operating temperatures are exceeded

6. Controls

   a. Factory installed contactor and control circuit transformers
   b. Wall mounted or unit mounted thermostat. See Contract Drawings for thermostat locations (provide unit mounted if not indicated on Contract Drawings)

7. Accessories

   a. Disconnect switch

8. Mounting

   a. See Contract Drawings for mounting orientation.
   b. Provide all required mounting hardware and ancillary fasteners

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Coordinate with work of other trades.

B. Install unit heaters in accordance with manufacturer's written installation instructions.

C. Install unit heaters to comply with NFPA 90A.

D. Install propeller unit heaters level and plumb.

3.3 INSPECTION

A. Verify that adequate clearance between unit heaters and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 TRAINING

A. See Section 23 00 10 – Mechanical General Provisions

END OF SECTION 23 82 39

SECTION 26 05 11 - ELECTRICAL GENERAL

PART 1 – GENERAL

1.1 GENERAL

A. All work shall conform to the latest editions of the National Electrical Code (NEC) [National Fire Protection Association (NFPA) 70], the Standard for Electrical Safety in the Workplace (NFPA 70E), the Life-Safety Code (NFPA 101), the International Building Code, the Americans with Disabilities Act, and all other applicable federal, state, and local codes and regulations.

B. All work shall be performed in strict compliance with NFPA 70E. Submission of bid shall stand as an agreement by the Contractor to indemnify and hold harmless the Engineer and Owner from all liability related to damage and/or injury to personnel and equipment during the installation of the project.

C. The contract documents are schematic in nature and are intended to convey the intent of the electrical work to be performed on this project. Provide all material, labor, equipment, etc., necessary to provide complete and operable electrical systems.

D. The General Conditions, Supplementary Conditions, General Requirements, Information to Bidders, and all other parts of this set of Contract Documents are hereby adopted and are applicable to the Division 26, 27, and 28 Contractor.

1.2 SCOPE OF WORK

A. Visit site prior to bid. Devise a plan for installation of complete and operable electrical systems meeting the requirements and intent of the Contract Documents. Submission of Bid stands as evidence that the Contractor accepts the Contract Documents as sufficient and complete for the work to be performed. Notify the engineer at least two weeks prior to bid of any discrepancies between the Contract Documents and actual field conditions. No change orders will be granted due to existing conditions that could have been observed during a site visit.

B. Provide temporary power and lighting during construction. Coordinate with the General Contractor for the exact requirements.

C. Electrical switchgear and panelboard layouts are based on sizes of Square D equipment. Equipment manufactured by General Electric, Siemens, and Cutler Hammer are equally acceptable. However, the Electrical Contractor is responsible for selecting and furnishing gear that will fit in the spaces provided and shall be responsible for arranging the gear to meet the required code clearances. Regardless of the manufacturer, the Electrical Contractor shall provide a drawn-to-scale electrical layout with the equipment brochures for all rooms in which panelboards, motor control centers, switchboards, or switchgear are placed. The drawings shall include the work of all other trades including mechanical system piping, ductwork, sprinkler piping, etc. No conduits shall be installed until layouts have been approved.

D. Locate junction boxes, pull boxes, disconnects, and other equipment requiring access in such a manner that they are accessible at the end of construction. Notify the Architect where it is impossible to plan conduit routing or equipment placement in such a manner, and provide the necessary access panels in the ceiling or wall as required. The access panel type and style shall be subject to the Architect's approval. Employ a painter to provide the appropriate coatings as directed by the Architect.

E. Relocate, or recircuit, all electrical equipment, conduit, and circuitry conflicting with or obstructing work on this project. Where the electrical systems are owned by other entities, pay them to relocate, or recircuit, their facilities.

F. Arrange for connection of service to all electrical systems by the appropriate utility company. Coordinate completely with all utility company requirements even if they are different than the contract documents. If utility company requirements are different from the contract documents, notify the engineer at least ten days prior to bid. Pay all utility company charges necessary for installation and connection of service. **No change orders will be granted for utility company connection fees.**

G. Provide all necessary equipment, raceway, circuitry, fittings, lugs, terminations, labor, etc. and connect to all equipment and appliances requiring electrical connections furnished herein, by the Owner, or by other Contractors. Prior to ordering electrical equipment and roughing in for equipment furnished by the Owner or other Contractors, verify all connection types, connection locations, connection heights, voltages, number of phases, conductor sizes, disconnecting means, breaker sizes, etc. Furnish the proper electrical equipment for the equipment actually being supplied.

1.3 WORK IN EXISTING FACILITIES

A. All work shall be scheduled and coordinated through the General Contractor with the Owner. Provide necessary costs for all work during both normal and premium work hours in bid.

B. Provide continuous uninterrupted power to all existing facilities to remain during the entire construction process. Any required power outages must be scheduled and approved by the Owner in writing at least three days prior to the outage.

1.5 SUBMITTALS AND SHOP DRAWINGS

A. Within 30 days after award of Contract and prior to beginning work, provide six bound copies of manufacturers' cut sheets containing information concerning each article of electrical equipment to be furnished on this project. These cut sheets shall contain sufficient information to prove compliance with the contract documents. Information addressing the requirements of the contract documents shall be highlighted. Each bound set shall bear the stamp of the Electrical Contractor as well as the General Contractor.

B. Within 30 days after award of Contract and prior to beginning work, provide six sets of full size shop drawings showing exact equipment locations with all equipment drawn to scale. Show all raceways with their junction boxes and pull boxes. Show all connection types, locations, and heights to equipment. Provide mounting and support details for all raceways and equipment. Coordinate with all other trades to ensure that there are no conflicts between systems. Each set of shop drawings shall bear the stamp of the Electrical Contractor, the General Contractor, and all Project Sub-Contractors. Failure to submit these Shop Drawings will render the Electrical Contractor responsible for resolving all conflicts between trades at his own expense.

C. Submittals and Shop Drawings are reviewed to determine quality of materials. Approval of submittals and shop drawings does not relieve the Contractor of meeting the requirements and intent of the Contract Documents.

D. Outlet, light fixture, and device locations are shown in their approximate locations on the drawings. Coordinate with Architectural drawings to get final locations. Mount all electrical outlets shown at counters such that the bottom of the box is two inches above the backsplash

or six inches above a counter with no backsplash. The Owner reserves the right to relocate outlets, light fixtures, and devices a distance not to exceed twenty feet prior to the installation of outlet boxes.

PART 2 - PRODUCTS

2.1 All electrical equipment and materials shall be new. All equipment and materials shall be stored on the job site in weatherproof enclosures. Electronic equipment shall be stored in facilities where the temperature and humidity are controlled. In addition, comply completely with all manufacturers' requirements for storage and handling.

2.2 All equipment shall be UL listed for the application in which it is used and shall be labeled as evidence of its UL listing.

2.3 Each circuit breaker supplying a multiwire branch circuit shall be installed with a manufacturer supplied handle tie to simultaneously disconnect all ungrounded conductors. Each multi-wire branch circuit shall comply with NEC article 210.4.

2.4 Products shall be selected to maintain or improve the aesthetics of the facility. Gain approval of the Architect or Engineer prior to ordering or installing any electrical equipment or raceway.

PART 3 – EXECUTION

3.1 WORKMANSHIP

All work shall be performed with an emphasis on neatness. The Engineer, Architect, and Owner retain the right to reject work that is, in their judgment, unsatisfactory.

3.2 EXPERIENCE

The Contractor shall have completed at least two jobs of similar size and scope within the past five years. The Engineer reserves the right to reject Contractors based on their inability to submit evidence of their experience, or based on experience with the Contractor on previous projects.

3.3 PERMITS

Obtain and pay for all permits required for work.

3.4 FIREPROOFING

A. Fireproof all penetrations through firewalls with a fireproofing compound listed to maintain the rating of the wall through which the raceway passes.

B. The fire-stopping caulk shall be a one-part, intumescent, latex elastomer. The caulk shall be capable of expanding a minimum of 3 times at 1000°F. The material shall be thixotropic and be applicable to overhead, vertical and horizontal fire-stops. The caulk shall be listed by independent test agencies such as UL or FM and be tested to, and pass the criteria of, ASTM E 814 Fire Test, tested under positive pressure. It shall comply with the requirements of the NEC (NFPA-70), BOCA, ICBO, SBCCI and NFPA Code 101. Fire-stopping caulk shall be paintable, but shall be non-hardening. Fire-stopping caulk shall be 3M Fire barrier CP or approved equal.

C. The fireproofing materials shall be installed by individuals certified to perform such work. Submit evidence of personnel certifications with electrical equipment brochures.

D. Where cable trays are shown crossing firewalls, terminate the cable tray on each side of the wall and run the conductors through conduits installed in the wall. Fireproof around the conductors after installation.

E. Provide mineral wool packing and all other materials recommended by the manufacturer for a complete installation.

3.5 FLASHING

Provide all necessary equipment and flash all roof penetrations in such a manner to ensure that all penetrations are completely sealed and all roof warranties remain in effect. Where there are no roof warranties, the Electrical Contractor shall guarantee the electrical penetrations against leaking for a period of one year from project completion. Employ a professional roofing contractor to perform all flashing.

3.6 PROTECTION

A. Keep energized equipment covered during all phases of construction. Use enclosures, doors, covers, etc., to ensure that neither personnel nor machinery contact live electrical equipment.

B. Replace electrical equipment that is damaged during construction.

3.7 DAMAGED FACILITIES

A. Locate all existing site equipment and utilities prior to beginning construction. Repair all equipment and utilities damaged during construction, or pay for the repair of the equipment and utilities where required by the Owner of the damaged facilities.

B. Coordinate the routing of all circuits and the locations of all devices with the Architect or Engineer and the Owner. Shop drawings shall describe completely the locations and elevations of all raceways, boxes, fittings, and equipment.

3.8 EXCAVATION AND BACKFILL

A. Excavate in such a manner as to minimize erosion of the soil. Backfill trenches around conduits with fine sand that is free of rocks, clods, and debris. Fill sand a minimum of 4” over conduits. Backfill the rest of the trench in six inch increments, wetted, and tamped. Final compaction shall be a minimum of 95% of that of the adjacent earth. Resurface the grade with the same material as that excavated from the grade whether it be paving, concrete, sod, etc. Repair work shall be comparable to the quality of the original site prior to excavation.

B. Provide a 3” wide plastic labeled marker tape 12” below grade over all electrical conduits buried underground. Tapes for power circuits shall have a warning such as “Caution: Buried Electrical Line Below.” Labels on tapes for telephone, data, cable television, and other facilities shall adequately describe the line over which they are buried.

C. Provide a #12 AWG wire in each buried conduit run labeled accordingly on each end.

3.9 IDENTIFICATION

A. Label all switchboards, panel boards, motor starters, disconnects, and motor control centers furnished under Division 26, 27, and 28 and other divisions of this contract with engraved rigid plastic nameplates having letters at least ¼ inch high. Nameplates shall be bolted to the enclosure. All labels shall indicate the voltage, number of phases, the AIC rating, and the panelboard and circuit number from which the device is fed.

B. All circuit breakers in Switchboards, Motor Control Centers, Square D I-Line, and similar pane lboards shall be labeled with plastic nameplates (as described in Part A) providing the name of the load served and the ampacity and number of poles of the breaker.

C. All Square D NQOD, NF and similar panel boards shall have typewritten circuit directories.

D. Label all conductors at all junction boxes, pull boxes, and terminations with typewritten adhesive markers indicating the panel board or switchboard name and circuit number of the conductor. Labels shall be Brady Datatab or approved equal.

E. Label all junction boxes and pull boxes with stenciled painted letters containing the name of the panel board and circuit numbers of the circuits contained within. Use black paint for normal circuits, red paint for emergency circuits, and orange paint for fire alarm circuits. The Contractor may select other colors for junction boxes and pull boxes for auxiliary systems.

F. Label all conduits in the most likely direction of access and view every 50’ and on both ends of each bend with stenciled painted letters containing the name of the panel board and circuit numbers of the circuits contained within. Use black paint for normal circuits, red paint for emergency circuits, and orange paint for fire alarm circuits. The Contractor may select other colors for conduits for auxiliary systems.

3.10 AS-BUILT DRAWINGS

Maintain one set of drawings during construction for as-built markings. Mark these drawings in red to indicate field changes. Provide these drawings to the Engineer at the end of the construction process. Where required under the General Conditions, Special Conditions, or other portions of this contract, provide revised computer drawn as-built drawings to the Engineer at the end of construction.

3.11 TESTING

A. Test all systems, or pay testing agencies as required, for compliance with the requirements of all regulatory agencies.

B. Test the electrical power service ground using a Biddle Three-Terminal Ground Resistance Tester, or approved equal. Grounds shall meet the requirements of the NEC, or of Specification 26 05 26, whichever is more stringent. Test grounds only when the earth is dry. Provide additional ground rods as necessary to achieve the required results.

C. Prior to making final equipment connections, test all service, feeder, and branch circuit conductors for continuity, phase-to-phase faults, and phase-to-ground faults using a Megger BM100 or approved equal test instrument generating 500 Vdc. Insulation resistance shall be a minimum of 500,000 Ohms between any conductor and ground and 1,000,000 Ohms between any two conductors.

D. Test other systems as required in their respective specifications.

E. Provide three bound copies of all test results to the Engineer at the end of the construction process. No Recommendation of Substantial Completion will be granted until all testing reports have been submitted.

3.12 WARRANTY

Provide the Owner a written guarantee to repair, or replace, all faulty equipment and systems for a period of one year from date of Substantial Completion. During this one-year period, a representative of the Contractor shall be on the site actively working on the repairs within 24 hours of the Owner's telephone call. During this period of time, the Owner shall not be charged for any repair work or expenses related with the repair work unless the Contractor can prove that the Owner has damaged the equipment or system.

END OF SECTION

SECTION 26 05 19 – LOW-VOLTAGE POWER CONDUCTORS AND CABLES

PART 1 – GENERAL

1.1 Provide all circuitry, terminations, splices, connectors, lugs, and other equipment necessary for connection of all equipment requiring electrical connections.

PART 2 – PRODUCTS

2.1 CONDUCTORS

A. All electrical conductors shall be soft-drawn annealed copper having 98% conductivity and an insulation rating of 600V.

B. Conductors shall be UL listed for installation in the raceway in which they are to be installed.

C. Conductors shall be rated 90 degrees C for use in residential, commercial, industrial, and institutional facilities, and shall be listed as 105 degrees C appliance wire. Conductors shall be listed under UL 83, UL 1063, and UL 758. If XLP or EPR insulation is used, conductors shall be listed under UL 44 and NEMA WC7.

D. Conductors used for branch circuits, feeders, auxiliary systems, and controls run in dry locations shall have PVC insulation and a Nylon outer jacket. They shall be THHN/THWN or XHHW-2.

E. Conductors used for branch circuits, feeders, auxiliary systems, and controls run in wet locations shall have XLP or EPR insulation and be type XHHW-2.

F. Sizes #10 and #12 shall be solid conductors except where used for controls. All controls conductors shall be stranded.

G. Use minimum #14 AWG conductors for controls and auxiliary circuits. Use larger conductors as required to compensate for voltage drops exceeding 3% of the system voltage.

H. Conductors shall be furnished in the colors described below unless local ordinances require different colors. Conductors #10 and smaller shall be furnished with colored insulation; conductors larger than #10 shall be taped with the appropriately colored tape for a length of at least 2” at each panelboard, junction box, pull box, load, or other exposed location. Ground conductors shall be taped green for their entire exposed length.

System Voltage	208Y/120V, 3-Phase, 4-Wire	120/240V, 3-Phase, 4-Wire	480Y/277V, 3-Phase, 4-Wire
Phase A	Black	Black	Brown
Phase B	Red	Orange	Orange
Phase C	Blue	Blue	Yellow
Neutral	White	White	Gray
Ground	Green	Green	Green

PART 3 – EXECUTION

3.1 CONDUCTORS

A. Install conductors carefully using a minimum of two tradesmen – one feeding the conductors into the conduit, and the other pulling the conductors into the conduit.

B. Join stranded conductors with appropriate mechanical or compression lugs. Wire nuts may be used for solid conductors only.

C. Splices shall only be made in approved enclosures. Splices shall not be pulled inside conduits.

D. Provide cable supports and strain relief connectors as required by the NEC.

E. Furnish junction boxes, pull boxes, handholes, manholes, etc. as required to ensure that the maximum number of bends allowed by the NEC are not exceeded and to ensure that the cables are not damaged during installation.

END OF SECTION

SECTION 26 05 26 – GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.1 GENERAL

Ground all equipment, systems, structures, etc., per the latest edition of the National Electrical Code (NEC).

PART 2 – PRODUCTS

2.1 Use mechanical bolted connections in dry locations that are accessible.

2.2 Use exothermic welds in wet locations and locations that will be inaccessible at the end of construction.

2.3 Ground rods shall be UL listed 3/4” x 10’ copper-clad steel ground rods with a minimum copper cladding thickness of 10 mils.

PART 3 – EXECUTION

3.1 Ground rods shall be installed with their tops no less than 6” below grade.

3.2 Bond ground connections to metal raceways at each end of the conduit run. Provide grounding bushings where required by the NEC. Where cable trays are used, bond the ground conductor to each section and fitting of the tray.

3.3 Provide all circuits with an equipment grounding conductor sized per the NEC, or as shown on the drawings. Circuitry shown on drawings does not include the required equipment grounding conductor. Where multiple circuits are run with a common neutral, only one equipment grounding conductor is needed. The equipment grounding conductor shall be furnished with green insulation for conductors #8 AWG and smaller; where larger than #8, the equipment grounding conductor shall be taped green for its entire exposed length.

3.4 The grounding electrode conductor(s) shall be bare or shall be colored green for its entire exposed length.

3.5 Individual ground conductors shall be installed in PVC conduit sized per the NEC.

3.6 Provide receptacles, luminaires, and other devices with a green conductor that bonds the receptacle grounding screw or pigtail, the outlet box grounding screw, and the equipment grounding conductor together.

3.7 In health care facilities, where two or more different panel boards serve the same patient-care area, an 8 AWG insulated continuous copper conductor shall bond these different panel boards together.

3.8 Telephone, cable television, and other auxiliary systems shall be bonded to the electrical building service ground using a conductor no smaller than #6 AWG.

END OF SECTION

SECTION 26 05 33 – RACEWAYS, OUTLET BOXES AND JUNCTION BOXES for ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.1 GENERAL

A. All electrical systems circuitry shall be contained in raceways unless expressly listed in the specification for that system.

B. Outlet Boxes and Junction Boxes

1. Furnish and install all outlet boxes and junction boxes in accordance with this specification and the requirements of the NEC.

2. Provide outlet boxes for all switches, receptacles, luminaires, telephone jacks, cable jacks, and other devices furnished in this Contract. Provide all necessary hardware including, but not limited to, additional structural support, support brackets, screws, bolts, fixture studs, etc.

3. Outlet boxes and junction boxes in dry locations shall be galvanized stamped steel boxes sized per the latest edition of the National Electrical Code (NEC), but no less than 4” x 4” x 2 1/8” deep. The thickness of the steel shall be in compliance with the requirements of the NEC. Provide stamped steel covers for all junction boxes manufactured to fit the particular box on which it is used.

4. Outlet boxes used in concrete and masonry walls and ceilings shall be of the concrete type manufactured for such applications.

5. Outlet boxes and junction boxes in wet locations shall be of cast metal construction with gasketed waterproof covers. All conduit connections to the boxes shall be made watertight.

6. Wall outlet boxes shall be 4” x 4” x 2 1/8”, or larger as required, with plaster rings provided for final flush installation. Plaster rings shall have single-gang openings unless the equipment mounted inside requires two-gang installation.

7. Floor boxes in slabs on grade shall be deep rectangular, cast iron, fully adjustable boxes with brass rings. Covers shall be made of brass and shall provide flip top access to the power or data jacks inside. Screw-on covers are not acceptable unless a flip-top cover is unavailable for the device installed in the floor box. Provide the box sized as required for the number of devices shown installed. Boxes shall be as follows, or approved equal:

   a. Single-Gang Boxes: Hubbell B2436
   b. Single-Gang Cover Plates: Hubbell S3825
   c. Double-Gang Boxes: Hubbell B4233
   d. Double-Gang Cover Plates: Two Hubbell S3825 Cover Plates
   e. Triple-Gang Boxes: Hubbell B4333
   f. Triple-Gang Cover Plates: Three Hubbell S3825 Cover Plates

8. In slabs above grade, use cast iron, semi-adjustable shallow boxes as follows, or approved equal:

   a. Single-Gang Boxes: Hubbell B2414
   b. Two-Gang Boxes: Hubbell B4214
   c. Three-Gang Boxes: Hubbell B4314

9. Receptacles installed in floor boxes shall be as described in Specification 26 09 23, Switches and Receptacles. Data, Telephone, or Combination Data and Telephone Outlets shall consist of Category 5 rated RJ45 jacks mounted in a Hubbell DJOI strap for use under a S3825 flip top cover plate.

10. In existing slabs above grade, use poke thru boxes as follows, or equal:

    a. Hubbell System One

11. Size all boxes per the requirements of the latest NEC.

1.2 SCOPE OF WORK

A. Raceways

1. Provide all raceways, fittings, couplings, anchors, supports, hangers, etc. for complete raceway systems.

2. Use Schedule 40 polyvinyl chloride (PVC) conduit for circuits run underground and in slabs on grade level. Provide PVC-coated galvanized rigid steel elbows and PVC-coated galvanized rigid steel conduit for all vertical runs extending to a point at least 6" above grade. Galvanized Rigid steel conduit coated with two complete coats of asphaltum or bituminous paint may be used in lieu of PVC-coated galvanized rigid steel conduit.

3. Use Galvanized Rigid Steel (GRS) conduit for all applications where circuits are run above ground exposed to the weather.

4. Use Intermediate Metal Conduit (IMC) for all branch circuits, feeders, and auxiliary circuits requiring conduit 1 ¼" nominal trade size or larger in dry locations.

5. Use Electrical Metallic Tubing (EMT) for all branch circuits and feeders less than 1 ¼" nominal trade size in dry locations and in slabs above grade level.

PART 2 – PRODUCTS

2.1 Products for Raceways

A. PVC conduits, fittings, couplings, adapters, and accessories shall be UL listed and approved for use with 90 degree Celsius conductors. The UL label shall be affixed to each ten foot length of conduit and each fitting. Conduits shall comply with NEMA Specification TC-2 and UL 651. Fittings shall comply with NEMA TC-3 and UL 514b.

B. PVC-coated conduits, fittings, couplings, adapters, and accessories shall be UL listed with PVC as the primary corrosion protection. They shall be hot dipped galvanized rigid steel conduit with threads electro-galvanized after cutting. The conduit shall meet UL 6. The fittings shall meet UL 514B. The PVC coating shall be uniformly applied to the interior and exterior of all conduit and fittings. The coating shall be nominally 2 mils thick. The PVC coating shall extend one pipe diameter or two inches, whichever is less, at every male fitting except unions to fit over the joining female connection. Couplings shall contain a series of longitudinal ribs, 40 mils in thickness, to protect the coating from damage by tools during installation. PVC-coated conduits shall be ETL Verified PVC-001. Fittings shall be manufactured to the same standard. PVC-coated conduit shall be Robroy Plastibond or approved equal.

C. GRS conduits, fittings, couplings, adapters, and accessories shall be UL listed. They shall be hot-dipped galvanized steel. They shall meet the safety standards of UL 6, and shall be manufactured to ANSI C80.1. Threads shall be hot galvanized after cutting.

D. IMC conduits, fittings, couplings, adapters, and accessories shall be UL listed. They shall be hot-galvanized steel. Fittings, couplings, adapters, and accessories shall be the same as those for GRS conduit described above. IMC shall meet UL 1242 and ANSI C80.6. Threads shall be hot galvanized after cutting. The inside of the conduit shall be finished with a corrosion-resistant coating.

E. EMT conduits, fittings, couplings, adapters, and accessories shall be UL listed. They shall be hot galvanized steel and shall be produced in accordance with UL 797 and ANSI C80.3. The inside shall be finished with a corrosion-resistant lubricating coating.

F. Conduit fittings used with EMT conduits may be set screw indenter type or compression type. All metallic fittings for IMC and Rigid conduit shall be compression type fittings.

G. Flexible metallic conduit shall be constructed of galvanized steel and shall be UL listed as compliant with UL 1 and UL 1479.

H. Liquidtight flexible conduit shall be constructed of galvanized steel and shall be coated with a PVC jacket to resist liquids, dirt, grease, and oils. All fittings shall be designed, constructed, and installed to maintain the integrity of the liquidtight connections. Liquidtight flexible conduit shall comply with UL 360.

2.2 ACCEPTABLE MANUFACTURERS FOR OUTLET BOXES AND JUNCTION BOXES.

A. Outlet boxes and junction boxes shall be manufactured by Raco, Steel City, Crouse Hinds, or Appleton.

PART 3 – EXECUTION

3.1 CONDUIT EXECUTION

A. Conduits run underground shall be buried no less than 24” deep. Services and primary conduits feeding transformers shall be buried no less than 48” deep.

B. **Do not install conduits in or below ground floor slabs, except for service conduits, site lighting, and where specifically indicated on the drawings.**

C. Do not install conduits within 6” of the deck where a screw down type roof system is utilized.

D. PVC-coated conduits may be field-bent provided that manufacturer-approved tools are used. Individuals installing PVC-coated conduits shall be trained for installation by factory-certified trainers. Provide evidence of training with equipment brochures.

E. Support and install all conduits per the latest edition of the National Electrical Code. Support groups of conduits with electrical strut supported by threaded rods anchored to the building structure. Supports shall be designed to hold no less than twice the weight of the conduit and conductors to be supported plus an additional 250 pounds at midspan.

F. All conduits shall be grouped and run parallel to each other and to building walls.

G. All conduits shall be assembled according to the manufacturer’s instructions.

H. Conduits run underground shall be assembled to be watertight.

I. Cap all conduits during installation. Pull a mandrel sized for that conduit and a cleaning brush through each conduit before installation of any conductors.

J. Conduits that are obviously damaged and field bends that are obviously out of round shall be replaced.

K. Provide final connections to equipment with flexible metallic conduit. In wet or damp locations, use liquidtight flexible conduit. Flexible conduit shall not exceed 72".

L. Terminate conduits entering boxes with a locknut inside the box and a locknut outside the box. Provide protective bushings on all conduit threads. Use watertight hubs where conduit terminations are exposed to moisture.

M. Use grounding bushings on all feeder conduits, all underground conduits, and where required by the National Electrical Code.

N. Conduits shall be run no closer than 12" to hot water pipes.

O. Where conduits are run through the ceiling and are required to make connections to equipment within the room that is not located near a wall, support the conduit from the structural ceiling and provide a flange bolted to the floor. Install a tee conduit fitting in the vertical run of conduit, and make the connection to the equipment with a piece of flexible conduit extending from the tee conduit fitting to the equipment.

P. Provide expansion fittings where conduits cross building expansion joints. Provide grounding jumpers between the conduits.

Q. Provide EMT conduit sleeves where conduits pass through walls, floors, or footings sized a minimum of two nominal trade sizes larger than the conduit that must pass through the sleeve.

R. Equip all empty conduits with a pullwire or string capable of withstanding 200 pounds of pulling tension.

3.2 Execution for Outlet Boxes and Junction Boxes.

A. All devices shall be flush mounted unless specific written permission is obtained from the Engineer for a particular device in a particular location.

B. Install outlet boxes in walls, and provide plaster rings such that wall finish contractor's finish is flush against the edge of the plaster ring. Workmanship will not be accepted where the hole in the wall shows behind the cover plate, or the wall finish is uneven or unpainted at the edge of the cover plate.

C. Use round or square ceiling outlet boxes as required for the device being installed. The ceiling shall be finished flush against the box; the fixture shall completely cover the box and mount tight against the ceiling. Coordinate the requirements of the fixture prior to installing the box.

D. Provide junction boxes, pull boxes, and conduit fittings where required by the NEC to limit the number of bends in the raceway, and where required to prevent damage to conductors due to long runs.

E. Junction boxes and pull boxes installed in the ground outside shall be Quazite Composolite or approved equal. Mount the boxes over 24" of washed gravel fill. If splices are to be made inside

the boxes, the boxes shall be of the type furnished with a bottom, and all conduit connections shall be watertight. In addition, all conductor splices shall be made watertight using an appropriate splice kit as manufactured by 3M, or an approved equal.

END OF SECTION

SECTION 26 09 23 - SWITCHES AND RECEPTACLES

PART 1 – GENERAL

Furnish and install all switches and receptacles in accordance with this specification and the requirements of the NEC.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

Switches and receptacles shall be manufactured by Hubbell, Cooper Wiring Devices, Leviton, or Pass & Seymour.

2.2 GENERAL

A. Switches and receptacles shall be specification grade. They shall have ampacity and voltage ratings suitable for the application in which they are used.

B. Consult architect or engineer for device colors prior to ordering devices.

C. Provide brushed stainless steel cover plates for all devices. A single cover plate shall cover all devices in one box.

D. Light switches shall be 20 Ampere, 120-277V back-wired and side-wired toggle switches. They shall be rated up to 2 HP at 240V. Each switch shall be equipped with a grounding screw. Switches shall be Hubbell CSB series or approved equal.

E. Duplex NEMA 5-20R receptacles shall be Hubbell HBL 5362A or approved equal.

F. Duplex GFI NEMA 5-20R receptacles shall be Hubbell HBL GF5362A or approved equal.

G. Weatherproof while-in-use cover plates shall be Teddico #34017-7 or approved equal. Cover plates shall be single gang, lockable, and constructed of heavy duty die cast metal.

H. All 125V, 15 and 20 ampere receptacles installed in dwelling units shall be of the tamper-resistant type.

I. All 15 and 20 ampere, 125 and 250V non-locking receptacles installed in wet or damp locations shall be listed as the weather-resistant type.

J. Devices furnished in this Contract, but not listed above, shall be of the same standard of quality as those items listed.

PART 3 – EXECUTION

3.1 Flush mount all devices unless specific written permission is obtained from the Engineer for a particular device in a particular location.

3.2 Install all devices vertically unless the drawings specifically state that the particular device should be mounted horizontally.

3.3 Install receptacles with the ground slot up.

END OF SECTION

SECTION 26 09 25 - OCCUPANCY SENSORS

PART 1 - GENERAL

1.1 Furnish and install a complete system of Occupancy sensors as shown on the drawings and as specified herein. The drawings are provided to show the general scope of the work, and show the absolute minimum components required. Actual system components, quantities, and locations shall be determined by the motion detector vendor and provided to the Contractor with the installation shop drawings.

1.2 The Contractor and Sales Representatives are advised to take notice of specified component characteristics when attempting to select and propose substitutions. It is highly unlikely that substitutions on a one-for-one component basis will produce results that provide acceptable system performance.

1.3 Provide all power packs, hardware, software, devices, circuitry, and other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer.

1.4 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections.

1.5 The wiring diagrams on these drawings are based on our best interpretation of the manufacturer's data that was available at the time of design; however, they shall not be used for system installation and configuration. The controls equipment vendor is expected to be thoroughly knowledgeable of the equipment that is being proposed, and shall provide detailed shop drawings tailored for each circuit and lighting zone on the project. General manufacturer's data sheets shall not be acceptable. The shop drawings shall be suitable for the installing electrician to use for complete installation of the circuitry without referring to data sheets or installation manuals for connection of lighting control equipment. These requirements shall be followed whether the specified equipment, or products of other manufacturers, is provided.

PART 2 - PRODUCTS

2.1 Wireless Occupancy Sensor: Wireless occupancy sensors shall be passive infrared, ceiling-mounted units. They shall be Lutron #LRF2-OCR2B-P-WH or approved equal.

2.2 Areas up to 500 Square Feet: Occupancy sensors used in areas up to 500 square feet shall be dual technology infrared and microphonics, ceiling-mounted units with a 360 degree, 500 square foot coverage.

2.3 Areas up to 2000 Square Feet: Occupancy sensors used in areas up to 2000 square feet shall be dual technology infrared and microphonics, ceiling-mounted units with a 360 degree, 2000 square foot coverage. They shall be Lutron #LOS-CDT-2000-WH or approved equal.

2.4 Power Packs: Power packs shall be of the same manufacturer as the occupancy sensors. Each shall be capable of controlling a 20 ampere circuit. They shall be rated for operation at the voltage of the system on which they will be used.

2.5 Circuitry: Provide control circuitry as required by the manufacturer for optimum system operation, but no less than the following: Control cables shall be 3-conductor #22 AWG copper with an overall jacket. Adjust conductor sizes as required to overcome unacceptable voltage drop.

PART 3 - EXECUTION

3.1 Occupancy sensors shall be provided so that their coverage areas overlap and there are no dead zones in the rooms where persons may stand and not be detected.

3.2 All work shall be done by qualified system technicians.

3.3 Wiring, including control wiring, shall be in Raceways meeting Specification 26 05 33.

3.4 Guarantee workmanship and material for a period of one year after final acceptance. During the warranty period, repair or replace faulty equipment at no cost to the Owner for labor, material, or expenses.

3.5 Upon completion of job, test entire system. After testing submit a certificate to the Architect stating verification of the following:

A. All devices have been tested and are working properly.

PART 4 – CLOSE-OUT DOCUMENTS

4.1 Provide the following documents to the Architect for delivery to the Owner at the time of substantial completion:

A. Written Guarantee
B. Two sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, a description of operation, shop drawings, wiring diagrams, maintenance procedures, and other literature required for operation and maintenance of equipment.

4.2 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written step-by-step instructional material.

4.3 Notify the General Contractor that you are to present during the Pre-final Inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels covers as required to show the quality of the installation. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 26 22 00 - TRANSFORMERS

PART 1 – GENERAL

Provide all equipment, labor, and materials required for complete and operable installation of transformers as shown on the drawings and specified herein.

PART 2 – PRODUCTS

2.1 Transformers 1000 KVA and smaller shall be listed by UL. They shall conform to the requirements of ANSI/NFPA 70. They are to be manufactured and tested in accordance with NEMA ST20.

2.2 Transformers shall be designed for operation at 60 Hz. Unless otherwise shown on the drawings, each transformer shall be a three-phase unit with a 480 volt, delta connected primary, and a 208Y/120 volt secondary.

2.3 Transformer shall be of the energy-efficient type.

2.4 Where transformers are shown on the drawings to be K-rated, they shall be UL listed and labeled for the K-rating indicated based on the sum of fundamental and harmonics per UL 1561. They shall be listed for 115 degrees C average temperature rise. K-rated transformers shall have an impedance of 3% to 5% with a minimum reactance of 2% in order to help reduce neutral current when supplying loads with large amounts of third harmonic current.

2.5 All insulating materials shall exceed NEMA ST20 standards and be rated for 220 degrees Celsius according to UL's component recognized insulation system.

2.6 Transformers 15 KVA and larger shall be rated for 150 degrees C temperature rise above an ambient temperature of 40 degrees C. Transformers 25 KVA and above shall have four 2.5% full capacity primary taps (two above and two below).

2.7 The maximum temperature of the top of the enclosure shall not exceed 50 degrees C above an ambient temperature of 40 degrees C.

2.8 Furnish transformers located outside with factory-furnished weatherproof enclosures.

2.9 Transformer coils shall be of continuous wound construction.

2.10 Transformer cores are to be visibly grounded to the enclosure by means of a flexible grounding conductor sized in accordance with applicable UL and NEC standards.

2.11 Transformers shall be ventilated and fabricated of heavy gauge sheet steel. The entire enclosure shall be finished utilizing a continuous process of degreasing, cleaning and phosphatizing, followed by electrostatic deposition of polymer polyester powder coating and baking to provide a uniform coating of all edges and surfaces.

2.12 Sound levels shall be warranted by the manufacturer not to exceed the following:

- 15 to 50 KVA – 45 dB
- 51 to 150 KVA – 50 dB
- 151 to 300 KVA – 55 dB
- 301 to 500 KVA – 60 dB
- 501 to 700 KVA – 62 dB

- 701 to 1000 KVA – 64 dB
- 1001 to 1500 KVA – 65 dB
- 1501 to 2000 KVA – 66 dB

PART 3 – EXECUTION

3.1 Install transformers in strict compliance with the manufacturer's instructions and the latest version of the National Electrical Code.

3.2 Provide concrete housekeeping pads for transformers mounted indoors. Housekeeping pads shall consist of 3.5" thick pads containing #4 reinforcing bars on 6" centers in both horizontal directions in the center of 3000 psi concrete. Where transformers are located outside, the pad shall extend at least 6" above grade and shall have a 12" wide footing at least 4" below the frost line; the footing shall be a minimum of 12" deep.

3.3 Transformers not exceeding 75 KVA may be wall-mounted where sufficient proof is provided that the structure can support the weight and where factory-provided wall brackets are used.

END OF SECTION

SECTION 26 24 00 - PANELBOARDS

PART 1 – GENERAL

1.1 Furnish and install all panelboards, complete with their circuit breakers, phase buses, neutral buses, ground buses, structural supports, and other equipment necessary for complete systems.

1.2 The equipment vendor shall perform all calculations necessary and provide complete Arc Flash Labels as required by the National Electrical Cod (NEC) and the drawings. Note: The drawings typically require more detail than required by the NEC.

PART 2 – PRODUCTS

2.1 GENERAL

A. Panelboards shall be designed, manufactured, and tested to be in compliance with NEMA PB 1, UL 50, UL 67, UL 489, NFPA 70, and the ASTM.

B. Circuit breakers shall be designed, manufactured, and tested to be in compliance with NEMA AB 1, UL 489, and Federal Specification W-C-375B/GEN.

C. Panelboards shall be UL listed for service entrance where used for that purpose.

D. Panelboard ampere interrupting current (AIC) ratings shall equal the lowest rated device in the panelboard. Provide panelboards with the AIC ratings shown on the Contract Drawings. Buses shall be braced to withstand the AIC rating shown on the drawings. Series ratings shall only be used where shown on the panelboard schedules.

E. All panelboards shall be furnished with dead-front, door-in-door construction.

F. Lug locations shall be determined during the creation of shop drawings for proper arrangement with the raceway system.

G. Buses shall be constructed of 98% conductivity copper or tin-plated copper.

H. Panelboard enclosures shall be NEMA 1 when they are to be mounted indoors, and NEMA 3R when they are to be mounted outdoors. Provide special enclosures where shown on the Contract Drawings.

2.2 ACCEPTABLE MANUFACTURERS

Panelboards shall be manufactured by Siemens, Square D, General Electric, or Cutler Hammer.

2.3 PANELBOARD CLASSES

A. Power distribution panelboards shall be available with mains and branch devices up to 1200 amperes. AIC ratings shall be available up to 200,000 Amperes. Power distribution panelboards shall be equipped with a nameplate containing the appropriate system voltage, number of wires, and number of phases for the system on which they are installed.

B. In 480Vac and less applications where a main breaker not exceeding 600 Amperes is required, the AIC rating does not exceed 65,000 Amperes, and no branch breakers exceed 125Amperes, Square D NF and equivalent panelboards may be used.

C. In 480Vac and less applications where a main breaker not exceeding 225 Amperes is required, the AIC rating does not exceed 14,000 Amperes, and no branch breakers exceed 100Amperes, Square D NEHB and equivalent panelboards may be used.

D. In 240Vac and less applications where a main breaker not exceeding 400 Amperes or main lugs not exceeding 600 Amperes is required, the AIC rating does not exceed 22,000 Amperes, and no branch breakers exceed 125 Amperes, Square D NQOD and equivalent panelboards may be used.

2.4 CIRCUIT BREAKERS

A. Circuit breakers shall be thermal magnetic, molded-case with quick-make, quick-break contact action. They shall have thermal and magnetic tripping elements on each pole. Breakers with multiple poles shall have common tripping of all poles. Circuit breaker ampere ratings shall be stamped on the handle. Interrupting ratings of the circuit breakers shall be equivalent to the specified AIC rating of the panelboard. Breakers handles shall reside in a position between “ON” and “OFF” after a trip condition. Breakers shall be rated HACR when used for heating, air-conditioning, and refrigeration; HID when used with High Intensity Discharge fixtures; and shall be rated SWD when used for switching duty.

B. Circuit breaker sizes for motor loads are based on Square D recommendations for use of their breakers at the motor horsepowers listed on the mechanical drawings. If equipment is used other than Square D, adjust breaker sizes per the manufacturer’s recommendations.

C. Each circuit breaker supplying a multiwire branch circuit shall be installed with a manufacturer supplied handle tie to simultaneously disconnect all ungrounded conductors. Each multiwire branch circuit shall comply with NEC article 210.4.

D. Circuit breakers with slash ratings, such as 120/240V or 480Y/277V, shall be used in solidly grounded systems where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the breaker’s voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker’s voltage rating.

E. Circuit breakers with straight voltage ratings, such as 240V or 480V, shall be used in systems other than solidly grounded systems (Corner-Grounded Delta, Ungrounded, Impedance Grounded, etc.) where the nominal voltage between any two conductors does not exceed the circuit breaker’s voltage rating. A two-pole circuit breaker shall not be used to protect a three-phase, Corner-Grounded Delta system unless the circuit breaker is marked 1Φ-3Φ.

PART 3 – EXECUTION

3.1 Install panelboards in complete compliance with all manufacturers’ installation instructions.

3.2 Install conductors neatly in panelboards. Group and tie-wrap circuits that share a common neutral.

3.3 Number circuits exactly as shown on the contract drawings.

END OF SECTION

SECTION 26 26 00 - SWITCHBOARD

PART 1 – GENERAL

1.1 Furnish and install the switchboard, complete with circuit breakers, phase buses, neutral buses, ground buses, structural supports, and other equipment necessary for a complete and operable installation.

1.2 The equipment vendor shall provide a complete protective device coordination study. The equipment vendor shall also perform all calculations necessary, and shall provide complete Arc Flash Labels as required by the National Electrical Code (NEC), NFPA 70E, and the equipment nameplate shown on the drawings. Note: The drawings typically require more detail than required by the NEC.

PART 2 – PRODUCTS

2.1 GENERAL

The switchboard shall meet the following specifications:

A. NEMA 1 enclosure of Code gauge steel phosphated and painted with gray paint.
B. Front Accessible
C. Buses shall be silver plated copper of sufficient size to limit the temperature rise to 65 degrees C based on UL tests.
D. Individual buses shall be covered with insulating material.
E. Bus bracing and all circuit breakers shall be rated for 100,000 AIC.
F. 100% capacity neutral.
G. Overhead Incoming Service – Cable connected.
H. Main Circuit Breaker sized as shown on the drawings. It shall be a 100% rated electronic trip circuit breaker with LSIG.
I. Branch Breakers shall be sized as shown on the drawings. They shall be 100% rated electronic trip circuit breaker with LSIG.
J. Engraved plastic phenolic nameplates identifying all breakers. Show Ampacity, Number of Poles, Load served.

2.2 ACCEPTABLE MANUFACTURERS

Switchboards shall be manufactured by Siemens, Square D, General Electric, Cutler Hammer, or approved equal.

PART 3 – EXECUTION

3.1 Provide a 4” thick concrete housekeeping pad that extends 1 1/2” around all edges of the Switchboard. Provide 1”, 45 degree chamfered edges.

3.2 Install conductors neatly in switchboards. Group and tie-wrap circuits that share a common circuit breaker.

3.3 Install switchboard in complete compliance with all manufacturer’s recommendations.

3.4 Provide Owner’s manual with close-out documents.

END OF SECTION

SECTION 26 28 00 - DISCONNECTS & SEPARATELY-MOUNTED CIRCUIT BREAKERS

PART 1 – GENERAL

Furnish and install all disconnects and separately mounted circuit breakers as shown on the drawings, specified herein, and required by the NEC.

PART 2 – PRODUCTS

2.1 GENERAL

A. Disconnects shall be of the heavy-duty type, and shall be UL listed for service entrance use. They shall meet or exceed the requirements of NEMA Standard KS1. Provide fuses sized to appropriately protect the load served. Equipment manufacturer's recommendations shall take precedence over the Contract Drawings.

B. Fuses shall be dual element, time-delay, Class J fuses. They shall be Bussman Low-Peak or approved equal.

C. Circuit breakers shall be thermal magnetic, molded-case with quick-make, quick-break contact action. They shall have thermal and magnetic tripping elements on each pole. Breakers with multiple poles shall have common tripping of all poles. Circuit breaker ampere ratings shall be stamped on the handle. Interrupting ratings of the circuit breakers shall be equivalent to the specified AIC rating of the panelboard. Breakers handles shall reside in a position between "ON" and "OFF" after a trip condition. Breakers shall be rated HACR when used for heating, air-conditioning, and refrigeration; HID when used with High Intensity Discharge fixtures; and shall be rated SWD when used for switching duty.

D. Circuit breaker sizes for motor loads are based on Square D recommendations for use of their breakers at the motor horsepowers listed on the mechanical drawings. If equipment is used other than Square D, adjust breaker sizes per the manufacturer's recommendations.

E. Circuit breakers with slash ratings, such as 120/240V or 480Y/277V, shall be used in solidly grounded systems where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the breaker's voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker's voltage rating.

F. Circuit breakers with straight voltage ratings, such as 240V or 480V, shall be used in systems other than solidly grounded systems (Corner-Grounded Delta, Ungrounded, Impedance Grounded, etc.) where the nominal voltage between any two conductors does not exceed the circuit breaker's voltage rating. A two-pole circuit breaker shall not be used to protect a three-phase, Corner-Grounded Delta system unless the circuit breaker is marked 1Φ-3Φ.

G. Disconnect and individually-mounted circuit breaker ampere interrupting current (AIC) ratings shall equal the rating of the panelboard from which they are fed unless otherwise noted.

H. Buses shall be constructed of 98% conductivity copper or tin-plated copper.

I. Switches shall be horsepower rated where used to serve motors.

J. Enclosures shall be NEMA 1 when they are to be mounted indoors, NEMA 3R when they are to be mounted outdoors, and NEMA 4X where they are subject to washdown. Provide special enclosures where shown on the Contract Drawings.

2.2 ACCEPTABLE MANUFACTURERS

Disconnects and separately-mounted circuit breakers shall be manufactured by Siemens, Square D, General Electric, or Cutler Hammer.

PART 3 – EXECUTION

3.1 Install disconnects and individually-mounted circuit breakers in complete compliance with all manufacturers' installation instructions. Where necessary, provide structural supports and bracing for installation.

3.2 Disconnects are to be surface-mounted.

3.3 Individually-mounted circuit breakers are to be flush-mounted unless otherwise shown.

END OF SECTION

SECTION 26 32 14.00 10 POLICE ADMIN - EMERGENCY/STANDBY POWER SYSTEMS GENERATOR SET

PART 1 – GENERAL

1.01 Scope

A. Provide complete factory assembled generator set equipment with digital (microprocessor-based) electronic generator set controls, digital governor, and digital voltage regulator.

B. Provide factory test, startup by a supplier authorized by the equipment manufacturer(s), and on-site testing of the system.

C. The generator set manufacturer shall warrant all equipment provided under this section, whether or not is manufactured by the generator set manufacturer, so that there is one source for warranty and product service. Technicians specifically trained and certified by the manufacturer to support the product and employed by the generator set supplier shall service the generator sets.

D. **The Contractor shall be responsible for obtaining the required fuel permit from the local officials.**

1.02 Codes and Standards

A. The generator set installation and on-site testing shall conform to the requirements of the following codes and standards, as applicable. The generator set shall include necessary features to meet the requirements of these standards.

1. CSA 282, 1989 Emergency Electrical Power Supply for Buildings
2. IEEE446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications
3. NFPA37 –
4. NFPA70 – National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701, and 702.
5. NFPA99 – Essential Electrical Systems for Health Care Facilities
6. NFPA110 – Emergency and Standby Power Systems. The generator set shall meet all requirements for Level 1 systems. Level 1 prototype tests required by this standard shall have been performed on a complete and functional unit, component level type tests will not substitute for this requirement.

B. The generator set and supplied accessories shall meet the requirements of the following standards:

1. NEMA MG1. Alternator shall comply with the requirements of the current version this standard as they apply to AC alternators.
2. UL142 – Sub-base Tanks
3. UL1236 – Battery Chargers
4. UL2200. The generator set shall be UL2200 listed.

C. The control system for the generator set shall comply with the following requirements.

1. CSA C22.2, No. 14 – M91 Industrial Control Equipment.
2. EN50082-2, Electromagnetic Compatibility – Generic Immunity Requirements, Part 2: Industrial.
3. EN55011, Limits and Methods of Measurement of Radio Interference Characteristics of Industrial, Scientific and Medical Equipment.
4. FCC Part 15, Subpart B.

5. IEC8528 part 4. Control Systems for Generator Sets
6. IEC Std 801.2, 801.3, and 801.5 for susceptibility, conducted, and radiated electromagnetic emissions.
7. UL508. The entire control system of the generator set shall be UL508 listed and labeled.
8. UL1236 –Battery Chargers.

D. The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

1.03 Acceptable Manufacturers

The basis of design for this project is based on generator sets manufactured by Cummins with microprocessor-based controls. The specification is written around this equipment to establish a standard of quality – not to limit competition. Equipment by Kohler or Caterpillar that meets the requirement of this specification is equally acceptable. Proposals must include a line by line compliance statement based on this specification.

1.04 Submittals.

A. Within 10 days after award of contract, provide six sets of the following information for review:
- Manufacturer’s product literature and performance data, sufficient to verify compliance to specification requirements.
- A paragraph by paragraph specification compliance statement, describing the differences between the specified and the proposed equipment.
- Manufacturer's certification of prototype testing.
- Manufacturer's published warranty documents.
- Shop drawings showing plan and elevation views with certified overall dimensions, as well as wiring interconnection details.
- Interconnection wiring diagrams showing all external connections required; with field wiring terminals marked in a consistent point-to-point manner.
- Manufacturer's installation instructions.

Part 2. PRODUCTS

2.01 Generator set

A. Ratings

1. The generator set shall operate at 1800 rpm and at a voltage of: 480Y/277 Volts AC, Three phase, 4-wire, 60 hertz.
2. The generator set shall be rated at 1500 kW, 2500 kVA at 0.8 PF, 3 Phase rating, based on site conditions of: Altitude 4334ft. (1321 meters), ambient temperatures up to 104 degrees F (40 degrees C).
3. The generator set rating shall be based on standby service.

B. Performance

1. Voltage regulation shall be plus or minus 0.5 percent for any constant load between no load and rated load. Random voltage variation with any steady load from no load to full load shall not exceed plus or minus 0.5 percent.
2. Frequency regulation shall be isochronous from steady state no load to steady state rated load. Random frequency variation with any steady load from no load to full load shall not exceed plus or minus 0.5%.
3. The diesel engine-generator set shall accept a single step load of 100% nameplate kW and power factor, less applicable derating factors, with the engine-generator set at operating temperature.

4. Motor starting capability shall be a minimum of 5521 kVA. The generator set shall be capable of recovering to a minimum of 90% of rated no load voltage following the application of the specified kVA load at near zero power factor applied to the generator set. Maximum voltage dip on application of this load, considering both alternator performance and engine speed changes shall not exceed 25%.
5. The alternator shall produce a clean AC voltage waveform, with not more than 5% total harmonic distortion at full linear load, when measured from line to neutral, and with not more than 3% in any single harmonic, and no 3rd order harmonics or their multiples. Telephone influence factor shall be less than 40.
6. The generator set shall be certified by the engine manufacturer to be suitable for use at the installed location and rating, and shall meet all applicable exhaust emission requirements at the time of commissioning.

C. Construction

1. The engine-generator set shall be mounted on a heavy-duty steel base to maintain alignment between components. The base shall incorporate a battery tray with hold-down clamps within the rails.
2. All switches, lamps, and meters in the control system shall be oil-tight and dust-tight

D. Connections

1. The generator set load connections shall be composed of silver or tin plated copper bus bars, drilled to accept mechanical or compression terminations of the number and type as shown on the drawings. Sufficient lug space shall be provided for use with cables of the number and size as shown on the drawings.
2. Power connections to auxiliary devices shall be made at the devices, with required protection located at a wall-mounted common distribution panel.
3. Generator set control interfaces to other system components shall be made on a permanently labeled terminal block assembly. Labels describing connection point functions shall be provided.

2.02 Engine and Engine Equipment

The engine shall be diesel, 4 cycle, radiator and fan cooled. The horsepower rating of the engine at its minimum tolerance level shall be sufficient to drive the alternator and all connected accessories. Two cycle engines are not acceptable. Engine accessories and features shall include:

A. An electronic governor system shall provide automatic isochronous frequency regulation. The governing system dynamic capabilities shall be controlled as a function of engine coolant temperature to provide fast, stable operation at varying engine operating temperature conditions. The control system shall actively control the fuel rate and excitation as appropriate to the state of the generator set. Fuel rate shall be regulated as a function of starting, accelerating to start disconnect speed, accelerating to rated speed. The governing system shall include a programmable warm up at idle and cooldown at idle function. While operating in idle state, the control system shall disable the alternator excitation system.

B. Skid-mounted radiator and cooling system rated for full load operation in 106.2 degrees F (41.2 degrees C) ambient as measured at the alternator air inlet. Radiator fan shall be suitable for use in a system with 0.5 in H_2O restriction. The equipment manufacturer shall fill the cooling system with a 50/50-ethylene glycol/water mixture prior to shipping. Rotating parts shall be guarded against accidental contact.

C. Electric starter(s) capable of three complete cranking cycles without overheating.

D. Positive displacement, mechanical, full pressure, lubrication oil pump.

E. Full flow lubrication oil filters with replaceable spin-on canister elements and dipstick oil level indicator.

F. An engine driven, mechanical, positive displacement fuel pump. Fuel filter with replaceable spin-on canister element. Fuel cooler, suitable for operation of the generator set at full rated load in the ambient

temperature specified shall be provided if required for operation due to the design of the engine and the installation.

G. Replaceable dry element air cleaner with restriction indicator.

H. Flexible supply and return fuel lines.

I. Engine mounted battery charging alternator, 70-ampere minimum, and solid-state voltage regulator.

J. Coolant Heater

1. Engine mounted, thermostatically controlled, coolant heater(s) for each engine. Heater voltage shall be as shown on the project drawings by the circuit feeding it. The coolant heater shall be UL499 listed and labeled.
2. The coolant heater shall be installed on the engine with silicone hose connections. Steel tubing shall be used for connections into the engine coolant system wherever the length of pipe run exceeds 12 inches. The coolant heater installation shall be specifically designed to provide proper venting of the system. The coolant heaters shall have provisions to isolate the heater for replacement of the heater element without draining the coolant from the generator set. The quick disconnect/automatic sealing couplers shall allow the heater element to be replaced without draining the engine cooling system or significant coolant loss.
3. The coolant heater shall be provided with a DC thermostat, installed at the engine thermostat housing. An AC power connection box shall be provided for a single AC power connection to the coolant heater system.
4. The coolant heater(s) shall be sized as recommended by the engine manufacturer to warm the engine to a minimum of 104F (40C) in a 40F (4C) ambient, in compliance with NFPA110 requirements, or the temperature required for starting and load pickup requirements of this specification.

K. Provide vibration isolators, spring/pad type, quantity as recommended by the generator set manufacturer.

L. Starting and Control Batteries shall be calcium/lead antimony type, 12 volt DC, sized as recommended by the engine manufacturer, complete with battery cables and connectors. The batteries shall be capable of a minimum of three complete 15-second cranking cycles at 40F ambient temperature when fully charged.

M. Provide exhaust silencer(s) for each engine of size and type as recommended by the generator set manufacturer and approved by the engine manufacturer. The muffler shall be critical grade. Exhaust system shall be installed according to the engine manufacturer's recommendations and applicable codes and standards.

N. Generators installed inside a building shall be provided with insulating blankets over all exhaust system components.

O. Provide a minimum 10 amp battery charger. Chargers shall be UL 1236-BBHH listed and CSA or CUL certified for use in emergency applications.

1. The charger shall be compliant with UL991 requirements for vibration resistance.
2. The charger shall comply with the requirements of EN61000-4-5 for voltage surge resistance; EN50082-2 for immunity; EN61000-4-2 for ESD; EN61000-4-3 for radiated immunity; ANSI/IEEE C62.41 category B and IN61000-4-4 for electrically fast transient; EN61000-4-6 for conducted emissions; and FCC Part 15 Class A for radiated emissions.
3. The charger shall be capable of charging a fully discharged battery without damage to the charger. It shall be capable of returning a fully discharged battery to fully charged condition within 24 hours. The charger shall be UL-labeled with the maximum battery amp-hour rating that can be recharged within 24

hours. The label shall indicate that the charger is suitable for charging of 200AH batteries per NFPA requirements.

4. The charger shall incorporate a 4-state charging algorithm, to provide trickle charge rate to restore fully discharged batteries, a bulk charge rate to provide fastest possible recharge after normal discharge, an absorption state to return the battery to 100 percent of charge, and a float stage to maintain a fully charge battery and supply battery loads when the generator set is not operating. In addition, the charger shall include an equalization timer. Charge rates shall be temperature compensated based on the temperature directly sensed at the battery.
5. The DC output voltage regulation shall be within plus or minus 1%. The DC output ripple current shall not exceed 1 amp at rated output current level.
6. The charger shall include the following features:
   a) two line alphanumeric display with programming keys to allow display of DC output ammeter and voltmeters (5% accuracy or better), display alarm messages, and perform programming;
   b) LED indicating lamp(s) to indicating normal charging condition (green), equalize charge state (amber), and fault condition (red);
   c) AC input overcurrent, over voltage, and undervoltage protection;
   d) DC output overcurrent protection;
   e) Alarm output relay
   f) Corrosion resistant aluminum enclosure

P. Provide a dual wall sub-base fuel storage tank with sufficient capacity to operate the generator at full load for a minimum of 24 hours. The tank shall be constructed of corrosion resistant steel and shall be UL listed. The equipment, as installed, shall meet all local and regional requirements for above ground tanks.

The double-wall subbase fuel tank shall be equipped with a leak detection system that provides local visual and audible alarms, and provides visual and audible alarms on the remote annunciator panel.

2.03 AC Generator

A. The AC generator shall be; synchronous, four pole, 2/3 pitch, revolving field, drip-proof construction, single prelubricated sealed bearing, air cooled by a direct drive centrifugal blower fan, and directly connected to the engine with flexible drive disc. All insulation system components shall meet NEMA MG1 temperature limits for Class H insulation system and shall be UL1446 listed. Actual temperature rise measured by resistance method at full load shall not exceed 125 degrees Centigrade.

B. The generator shall be capable of delivering rated output (kVA) at rated frequency and power factor, at any voltage not more than 5 percent above or below rated voltage.

C. A permanent magnet generator (PMG) shall be included to provide a reliable source of excitation power for optimum motor starting and short circuit performance. The PMG and controls shall be capable of sustaining and regulating current supplied to a single phase or three phase fault at approximately 300% of rated current for not more than 10 seconds.

D. The subtransient reactance of the alternator shall not exceed 12 percent, based on the standby rating of the generator set.

2.04 Generator Set Control.

The generator set shall be provided with a microprocessor-based control system that is designed to provide automatic starting, monitoring, and control functions for the generator set. The control system shall also be designed to allow local monitoring and control of the generator set, and remote monitoring and control as described in this specification.

The control shall be mounted on the generator set, or may be mounted in a free-standing panel next to the generator set if adequate space and accessibility is available. The control shall be vibration isolated and

prototype tested to verify the durability of all components in the system under the vibration conditions encountered.

The generator set mounted control shall include the following features and functions:

A. Control Switches

1. Mode Select Switch. The mode select switch shall initiate the following control modes. When in the RUN or MANUAL position the generator set shall start, and accelerate to rated speed and voltage as directed by the operator. A separate push-button to initiate starting is acceptable. In the OFF position the generator set shall immediately stop, bypassing all time delays. In the AUTO position the generator set shall be ready to accept a signal from a remote device to start and accelerate to rated speed and voltage.
2. EMERGENCY STOP switch. Switch shall be Red "mushroom-head" push-button. Depressing the emergency stop switch shall cause the generator set to immediately shut down, and be locked out from automatic restarting.
3. RESET switch. The RESET switch shall be used to clear a fault and allow restarting the generator set after it has shut down for any fault condition.
4. PANEL LAMP switch. Depressing the panel lamp switch shall cause the entire panel to be lighted with DC control power. The panel lamps shall automatically be switched off 10 minutes after the switch is depressed, or after the switch is depressed a second time.

B. Generator Set AC Output Metering. The generator set shall be provided with a metering set including the following features and functions:

1. Digital metering set, 1% accuracy, to indicate generator RMS voltage and current, frequency, output current, output KW, KW-hours, and power factor. Generator output voltage shall be available in line-to-line and line-to-neutral voltages, and shall display all three-phase voltages (line to neutral or line to line) simultaneously.

2. The control system shall monitor the total load on the generator set, and maintain data logs of total operating hours at specific load levels ranging from 0 to 110% of rated load, in 10% increments. The control shall display hours of operation at less than 30% load and total hours of operation at more than 90% of rated load.

3. The control system shall log total number of operating hours, total kWH, and total control on hours, as well as total values since reset.

C. Generator Set Alarm and Status Display.

1. The generator set control shall include LED alarm and status indication lamps. The lamps shall be high-intensity LED type. The lamp condition shall be clearly apparent under bright room lighting conditions. Functions indicated by the lamps shall include:

- The control shall include five configurable alarm-indicating lamps. The lamps shall be field adjustable for any status, warning, or shutdown function monitored by the genset. They shall also be configurable for color, and control action (status, warning, or shutdown).
- The control shall include green lamps to indicate that the generator set is running at rated frequency and voltage, and that a remote start signal has been received at the generator set. The running signal shall be based on actual sensed voltage and frequency on the output terminals of the generator set.
- The control shall include a flashing red lamp to indicate that the control is not in automatic state, and red common shutdown lamp.
- The control shall include an amber common warning indication lamp.

2. The generator set control shall indicate the existence of the warning and shutdown conditions on the control panel. All conditions indicated below for warning shall be field-configurable for shutdown. Conditions required to be annunciated shall include:

   low oil pressure (warning)
   low oil pressure (shutdown)
   oil pressure sender failure (warning)
   low coolant temperature (warning)
   high coolant temperature (warning)
   high coolant temperature (shutdown)
   high oil temperature (warning)
   engine temperature sender failure (warning)
   low coolant level (warning)
   fail to crank (shutdown)
   fail to start/overcrank (shutdown)
   overspeed (shutdown)
   low DC voltage (warning)
   high DC voltage (warning)
   weak battery (warning)
   low fuel-daytank (warning)
   high AC voltage (shutdown)
   low AC voltage (shutdown)
   under frequency (shutdown)
   over current (warning)
   over current (shutdown)
   short circuit (shutdown)
   over load (warning)
   emergency stop (shutdown)
   fuel leak (warning)
   (3) configurable conditions

3. Provisions shall be made for indication of three customer-specified alarm or shutdown conditions. Labeling of the customer-specified alarm or shutdown conditions shall be of the same type and quality as the above-specified conditions. The non-automatic indicating lamp shall be red, and shall flash to indicate that the generator set is not able to automatically respond to a command to start from a remote location.

D. Engine Status Monitoring.

1. The following information shall be available from a digital status panel on the generator set control:

   engine oil pressure (psi or kPA)
   engine coolant temperature (degrees F or C)
   engine oil temperature (degrees F or C)
   engine speed (rpm)
   number of hours of operation (hours)
   number of start attempts
   battery voltage (DC volts)

2. The control system shall also incorporate a data logging and display provision to allow logging of the last 10 warning or shutdown indications on the generator set, as well as total time of operation at various loads, as a percent of the standby rating of the generator set.

E. Engine Control Functions.

1. The control system provided shall include a cycle cranking system, which allows for user selected crank time, rest time, and # of cycles. Initial settings shall be for 3 cranking periods of 15 seconds each, with 15-second rest period between cranking periods.
2. The control system shall include an idle mode control, which allows the engine to run in idle mode in the RUN position only. In this mode, the alternator excitation system shall be disabled.
3. The control system shall include an engine governor control, which functions to provide steady state frequency regulation as noted elsewhere in this specification. The governor control shall include adjustments for gain, damping, and a ramping function to control engine speed and limit exhaust smoke while the unit is starting.
4. The control system shall include time delay start (adjustable 0-300 seconds) and time delay stop (adjustable 0-600 seconds) functions.
5. The control system shall include sender failure monitoring logic for speed sensing, oil pressure, and engine temperature which is capable of discriminating between failed sender or wiring components, and an actual failure conditions.

F. Alternator Control Functions:

1. The generator set shall include a full wave rectified automatic digital voltage regulation system that is matched and prototype tested by the engine manufacturer with the governing system provided. It shall be immune from misoperation due to load-induced voltage waveform distortion and provide a pulse width modulated output to the alternator exciter. The voltage regulation system shall be equipped with three-phase line to neutral RMS sensing and shall control buildup of AC generator voltage to provide a linear rise and limit overshoot. The system shall include a torque-matching characteristic, which shall reduce output voltage in proportion to frequency below an adjustable frequency threshold. Torque matching characteristic shall be adjustable for roll-off frequency and rate, and be capable of being curve-matched to the engine torque curve with adjustments in the field. The voltage regulator shall include adjustments for gain, damping, and frequency roll-off. Adjustments shall be broad range, and made via digital raise-lower switches, with an alphanumeric LED readout to indicate setting level. Rotary potentiometers for system adjustments are not acceptable.
2. A microprocessor-based protection device shall be provided to individually monitor all phases of the output current of the generator set and initiate an alarm (over current warning) when load current exceeds 110% of the rated current of the generator set on any phase for more than 60 seconds. The device shall shut down and lock out the generator set when output current level approaches the thermal damage point of the alternator (over current shutdown). The protective functions provided shall be in compliance to the requirements of NFPA70 article 445.
3. A microprocessor-based protection device shall be provided to monitor all phases of the output current for short circuit conditions. The control/protection system shall monitor the current level and voltage. The controls shall shut down and lock out the generator set when output current level approaches the thermal damage point of the alternator (short circuit shutdown). The protective functions provided shall be in compliance to the requirements of NFPA70 article 445.
4. Controls shall be provided to monitor the KW load on the generator set, and initiate an alarm condition (over load) when total load on the generator set exceeds the generator set rating for in excess of 5 seconds. Controls shall include a load shed control, to operate a set of dry contacts (for use in shedding customer load devices) when the generator set is overloaded.
5. A microprocessor-based AC over/under voltage monitoring system that responds only to true RMS voltage conditions shall be provided. The system shall initiate shutdown of the generator set when alternator output voltage exceeds 110% of the operator-set voltage level for more than 10 seconds, or with no intentional delay when voltage exceeds 130%. Under voltage shutdown shall occur when the output voltage of the alternator is less than 85% for more than 10 seconds. The system shall monitor individual phases and be connected line to neutral on 3-phase 4-wire generator sets, and for systems that are solidly grounded.

G. Other Control Functions

1. The generator set shall be provided with a network communication module to allow LonMark compliant communication with the generator set control by remote devices. The control shall communicate all engine and alternator data, and allow starting and stopping of the generator set via the network in both test and emergency modes.
2. A battery monitoring system shall be provided which initiates alarms when the DC control and starting voltage is less than 11VDC or more than 32 VDC. During engine cranking (starter engaged), the low voltage limit shall be disabled, and DC voltage shall be monitored as load is applied to the battery, to detect impending battery failure or deteriorated battery condition.

H. Control Interfaces for Remote Monitoring:

1. The control system shall provide four programmable output relays. These relay outputs shall be configurable for any alarm, shutdown, or status condition monitored by the control. The relays shall be configured to indicate: (1) generator set operating at rated voltage and frequency, (2) common warning, (3) common shutdown, (4) load shed command.
2. A fused 10 amp switched 12VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit whenever the generator set is running.
3. A fused 10 amp 12VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit at all times from the engine starting/control batteries.
4. The control shall be provided with a direct serial communication link for the LonWorks communication network interface as described elsewhere in this specification and shown on the drawings.

2.05 Other equipment to be provided with the generator set

A. Provide and install a 20-light LED type remote alarm annunciator with horn, located as shown on the drawings or in a location that can be conveniently monitored by facility personnel. The remote annunciator shall provide all the audible and visual alarms called for by NFPA Standard 110 for level 1 systems for the local generator control panel. Spare lamps shall be provided to allow future addition of other alarm and status functions to the annunciator. Provisions for labeling of the annunciator in a fashion consistent with the specified functions shall be provided. Alarm silence and lamp test switch(es) shall be provided. LED lamps shall be replaceable, and indicating lamp color shall be capable of changes needed for specific application requirements. Alarm horn shall be switchable for all annunciation points. Alarm horn (when switched on) shall sound for first fault, and all subsequent faults, regardless of whether first fault has been cleared, in compliance with NFPA110 3-5.6.2. The interconnecting wiring between the annunciator and other system components shall be monitored and failure of the interconnection between components shall be displayed on the annunciator panel.

B. The annunciator shall include the following alarm labels, audible annunciation features, and lamp colors:

Condition	Lamp Color	Audible Alarm
Normal Power (to Loads)	Green	No
Genset Supplying Load	Amber	No
Genset Running	Green	No
Not in Auto	Red (Flashing)	Yes
High Battery Voltage	Red	Yes
Low Battery Voltage	Red	Yes
Charger AC Failure	Red	Yes
Fail to Start	Red	Yes
Low Engine Temperature	Amber	Yes
Pre-High Engine Temperature	Amber	Yes
High Engine Temperature	Red	Yes

Pre-Low Oil Pressure	Amber	Yes
Low Oil Pressure	Red	Yes
Overspeed	Red	Yes
Low Coolant Level	Amber	Yes
Low Fuel Level	Amber	Yes
Network OK	Green	Yes
Fuel Leak Detected in Outside Tank	Red	Yes
(3) Spares	Configurable	Configurable

Low battery voltage lamp shall also be lighted for low cranking voltage or weak battery alarm.

C. The generator set shall be provided with mounted main line circuit breakers, sized as shown on the drawings. The circuit breakers shall incorporate an electronic trip unit that operates to protect the alternator under all overcurrent conditions, or a thermal-magnetic trip with other overcurrent protection devices that positively protect the alternator under overcurrent conditions. The supplier shall submit time overcurrent characteristic curves and thermal damage curve for the alternator, demonstrating the effectiveness of the protection provided.

D. Outdoor Weather-Protective Enclosure

1. The generator set shall be provided with an outdoor enclosure, with the entire package listed under UL2200. The package shall comply with the requirements of the National Electrical Code for all wiring materials and component spacing. Housing shall provide ample airflow for generator set operation at rated load in an ambient temperature of 100F. The housing shall have hinged access doors as required to maintain easy access for all operating and service functions. All doors shall be lockable, and include retainers to hold the door open during service. Enclosure roof shall be cambered to prevent rainwater accumulation. All electrical power and control interconnections shall be made within the perimeter of the enclosure.
2. All sheet metal shall be primed for corrosion protection and finish painted with the manufacturer's standard color using a two step electrocoating paint process, or equal meeting the performance requirements specified below. All surfaces of all metal parts shall be primed and painted. The painting process shall result in a coating that meets the following requirements:

   Primer thickness, 0.5-2.0 mils. Top coat thickness, 0.8-1.2 mils.

   Gloss, per ASTM D523-89, 80% plus or minus 5%. Gloss retention after one year shall exceed 50%.

   Crosshatch adhesion, per ASTM D3359-93, 4B-5B.

   Impact resistance, per ASTM D2794-93, 120-160 inch-pounds.

   Salt Spray, per ASTM B117-90, 1000+ hours.

   Humidity, per ASTM D2247-92, 1000+ hours.

   Water Soak, per ASTM D2247-92, 1000+ hours.

   Painting of hoses, clamps, wiring harnesses, and other non-metallic service parts shall not be acceptable. Fasteners used shall be corrosion resistant, and designed to minimize marring of the painted surface when removed for normal installation or service work.

3. Enclosure shall be constructed of minimum 12 gauge steel for framework and 14 gauge steel for panels. All hardware and hinges shall be stainless steel.
4. A factory-mounted exhaust silencer shall be installed inside the enclosure. The exhaust shall exit the enclosure through a rain collar and terminate with a rain cap. Exhaust connections to the generator set shall be through seamless flexible connections.
5. The enclosure shall include the following maintenance provisions:
   - Flexible coolant and lubricating oil drain lines, that extend to the exterior of the enclosure, with internal drain valves
   - External radiator fill provision.

E. The sub-base fuel tank shall be UL142 listed and labeled. Installation shall be in compliance to NFPA37. The fuel tank shall be a double-walled, steel construction and include the following features:
1. Emergency tank and basin vents.
2. Mechanical level gauge.
3. Fuel supply and return lines, connected to generator set with flexible fuel lines as recommended by the engine manufacturer and in compliance to UL2200 and NFPA 37 requirements.
4. Leak detection provisions, wired to the generator set control for local and remote alarm indication.
5. Basin drain.
6. Integral lifting provisions.
7. The Contractor shall fill the tank with fuel prior to the beginning of testing, and shall refill the tank at the completion of all testing.

Part 3. EXECUTION

3.01 Sequence of Operation

A. Generator set shall start on receipt of a start signal from remote equipment. The start signal shall be via hardwired connection to the generator set control and a redundant signal over the required network connection.

B. The generator set shall complete a time delay start period as programmed into the control.

C. The generator set control shall initiate the starting sequence for the generator set. The starting sequence shall include the following functions:

D. The control system shall verify that the engine is rotating when the starter is signaled to operate. If the engine does not rotate after two attempts, the control system shall shut down and lock out the generator set, and indicate “fail to crank” shutdown.

E. The engine shall fire and accelerate as quickly as practical to start disconnect speed. If the engine does not start, it shall complete a cycle cranking process as described elsewhere in this specification. If the

engine has not started by the completion of the cycle cranking sequence, it shall be shut down and locked out, and the control system shall indicate “fail to start”.

F. The engine shall accelerate to rated speed and the alternator to rated voltage. Excitation shall be disabled until the engine has exceeded programmed idle speed, and regulated to prevent over voltage conditions and oscillation as the engine accelerates and the alternator builds to rated voltage.

G. On reaching rated speed and voltage, the generator set shall operate as dictated by the control system in isochronous state.

H. When all start signals have been removed from the generator set, it shall complete a time delay stop sequence. The duration of the time delay stop period shall be adjustable by the operator.

I. On completion of the time delay stop period, the generator set control shall switch off the excitation system and shall shut down.

J. Any start signal received after the time stop sequence has begun shall immediately terminate the stopping sequence and return the generator set to isochronous operation.

3.02 Factory Testing.

A. The generator set manufacturer shall perform a complete operational test on the generator set prior to shipping from the factory. A certified test report shall be provided. Equipment supplied shall be fully tested at the factory for function and performance.

B. Factory testing may be witnessed by the owner and consulting engineer. Costs for travel expenses will be the responsibility of the owner and consulting engineer. Supplier is responsible to provide two weeks notice for testing.

C. Generator set factory tests on the equipment shall be performed at rated load and rated power factor. Generator sets that have not been factory tested at rated power factor will not be acceptable. Tests shall include: run at full load, maximum power, voltage regulation, transient and steady-state governing, single step load pickup, and function of safety shutdowns.

3.03 Installation

A. Equipment shall be installed by the contractor in accordance with final submittals and contract documents. Installation shall comply with applicable state and local codes as required by the authority having jurisdiction. Install equipment in accordance with manufacturer's instructions and instructions included in the listing or labeling of UL listed products.

B. Installation of equipment shall include furnishing and installing all interconnecting wiring between all major equipment provided for the on-site power system. The contractor shall also perform interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

C. Equipment shall be installed on concrete housekeeping pads. Equipment shall be permanently fastened to the pad in accordance with manufacturer’s instructions and seismic requirements of the site.

D. Equipment shall be initially started and operated by representatives of the manufacturer.

E. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired prior to final system testing. Equipment shall be thoroughly cleaned to remove all dirt and construction debris prior to initial operation and final testing of the system.

F. The equipment shall be tested in accordance with NFPA 110 requirements for Installation Acceptance regardless of whether the equipment is for a Level 1 installation or not. The Contractor shall be responsible for furnishing and connecting load banks as required. The Contractor shall fill the tank with fuel prior to system testing and shall refill the tank after the completion of all testing.

G. The equipment shall be tested at the end of the one year warranty period in accordance with the requirements of NFPA 110 Routine Maintenance and Operational Testing. The Contractor shall be

responsible for furnishing and connecting load banks as required. The Owner shall be responsible for the fuel for this test. Notify the Owner at least two weeks in advance of this scheduled test of the fuel requirements for the test.

3.04 On-Site Acceptance Test:

A. The complete installation shall be tested for compliance with the specification following completion of all site work. Testing shall be conducted by representatives of the manufacturer, with required fuel supplied by Contractor. The Engineer shall be notified in advance and shall have the option to witness the tests.

B. Installation acceptance tests to be conducted on-site shall include a "cold start" test, a two hour full load test, and a one step rated load pickup test in accordance with NFPA 110. Provide a resistive load bank and make temporary connections for full load test, if necessary.

C. Perform a power failure test on the entire installed system. This test shall be conducted by opening the power supply from the utility service, and observing proper operation of the system for at least 1 hour. Coordinate timing and obtain approval for start of test with site personnel.

3.05 Training

A. The equipment supplier shall provide training for the facility operating personnel covering operation and maintenance of the equipment provided. The training program shall be not less than 4 hours in duration and the class size shall be limited to 5 persons. Training date shall be coordinated with the facility owner.

3.06 Service and support

A. The manufacturer of the generator set shall maintain service parts inventory at a central location which is accessible to the service location 24 hours per day, 365 days per year.

B. The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical replacement parts at the local service organization, and in service vehicles. The service organization shall be on call 24 hours per day, 365 days per year.

C. The manufacturer shall maintain model and serial number records of each generator set provided for at least 20 years.

3.07 Warranty

A. The generator set and associated equipment shall be warranted for a period of not less than 5 years from the date of commissioning against defects in materials and workmanship.

B. The generator warranty shall be comprehensive. No deductibles shall be allowed for travel time, service hours, repair parts cost, etc.

END OF SECTION

SECTION 26 36 23 – AUTOMATIC TRANSFER SWITCHES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes transfer switches rated 600 V and less, including the following:

1. Automatic transfer switches

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, weights, operating characteristics, furnished specialties, and accessories.

1. Technical data on all major components of all transfer switches and other products described in this section. Data is required for the transfer switch mechanism, control system, cabinet, and protective devices specifically listed for use with each transfer switch. Include steady state and fault current ratings, weights, operating characteristics, and furnished specialties and accessories.

2. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.

B. Shop Drawings: Dimensioned plans, elevations, sections, and details showing minimum clearances, conductor entry provisions, gutter space, installed features and devices, and material lists for each switch specified.

1. Dimensioned outline drawings of assembly, including elevations, sections, and details including minimal clearances, conductor entry provisions, gutter space, installed features and devices and material lists for each switch specified.
2. Internal electrical wiring and control drawings.
3. Interconnection wiring diagrams, showing recommended conduit runs and point-to-point terminal connections to generator set.
4. Installation and mounting instructions, including information for proper installation of equipment to meet seismic requirements.

C. Manufacturer and Supplier Qualification Data

1. The transfer switch manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.
2. The manufacturer of this equipment shall have produced similar equipment for a minimum period of 10 years. When requested, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

D. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Features and operating sequences, both automatic and manual.
2. List of all factory settings of relays, timers and protective devices; provide setting and calibration instructions where applicable.

E. Warranty documents demonstrating compliance with the project's contract requirements.

1.4 QUALITY ASSURANCE

A. Only approved bidders shall supply equipment provided under this contract.

B. Manufacturer Qualifications: The equipment supplier shall maintain a service center capable of providing training, parts, maintenance and emergency repairs to equipment, including transfer switch generator sets and remote monitoring equipment (if applicable) at the site within a response period of less than twenty-four (24) hours from time of notification.

1. The transfer switch shall be serviced by technicians employed by, and specially trained and certified by, the generator set supplier and the supplier shall have a service organization that is factory-certified in both generator set and transfer switch service. The supplier shall maintain an inventory of critical replacement parts at the local service organization, and in service vehicles. The service organization shall be on call 24 hours per day, 365 days per year.
2. Submit names, experience level, training certifications, and locations for technicians that will be responsible for servicing equipment at this site.
3. The manufacturer shall maintain model and serial number records of each transfer switch provided for at least 20 years.

C. Source Limitations: All transfer switches are to be obtained through one source from a single manufacturer. The generator set manufacturer shall warrant transfer switches to provide a single source of responsibility for products provided.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked as suitable for use in emergency, legally required or optional standby use as appropriate for the connected load.

E. The automatic transfer switch installation and application shall conform to the requirements of the following codes and standards:

1. Transfer switches and enclosures shall be UL 1008 listed and labeled as suitable for use in emergency, legally required, and optional standby applications.
2. CSA 282, Emergency Electrical Power Supply for Buildings, and CSA C22.2, No. 14-M91 Industrial Control Equipment
3. NFPA 70, National Electrical Code. Equipment shall be suitable for use in systems in compliance with Articles 700, 701 and 702.
4. Comply with NEMA ICS 10-1993 AC Automatic Transfer Switches
5. IBC 2006 – The transfer switch(es) shall be prototype-tested and third-party certified to comply with the requirements of IBC group III or IV, Category D/F. The equipment shall be shipped with the installation instructions necessary to attain installation compliance
6. IEEE 446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications
7. EN55011, Class B Radiated Emissions and Class B Conducted Emissions
8. IEC 1000-4-5 (EN 61000-4-5); AC Surge Immunity
9. IEC 1000-4-4 (EN 61000-4-4) Fast Transients Immunity
10. IEC 1000-4-2 (EN 61000-4-2) Electrostatic Discharge Immunity

11. IEC 1000-4-3 (EN 61000-4-3) Radiated Field Immunity
12. IEC 1000-4-6 Conducted Field Immunity
13. IEC 1000-4-11 Voltage Dip Immunity
14. IEEE 62.41, AC Voltage Surge Immunity
15. IEEE 62.45, AC Voltage Surge Testing

F. Comply with NFPA 110 – Emergency and Standby Power Systems. The transfer switch shall meet all requirements for Level 1 systems, regardless of the actual circuit level.

G. The manufacturer shall warrant the material and workmanship of the transfer switch equipment for a minimum of one (1) year from registered commissioning and start-up, or eighteen (18) months from date of shipment.

H. The warranty shall be comprehensive. No deductibles shall be allowed for travel time, service hours, repair parts cost, and etc. during the minimum noted warranty period described above.

1.5 COORDINATION

A. Size and location of concrete bases and anchor bolt inserts shall be coordinated. Concrete, reinforcement and formwork must meet the requirements specified in Division 03. See section 3.1 for additional information on installation

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cummins Power Generation
2. Russelectric
3. ASCO

B. Equipment specifications for this Project are based on automatic transfer switches manufactured by Cummins Power Generation. Switches manufactured by Russelectric or ASCO that meet the requirement of this specification are acceptable, if approved not less than two weeks before scheduled bid date. Proposals must include a line-by-line compliance statement based on this specification.

C. Transfer switches utilizing molded case circuit breakers do not meet the requirements of this specification and will not be accepted.

2.2 GENERAL TRANSFER-SWITCH PRODUCT REQUIREMENTS

A. Provide transfer switches in the number and ratings that are shown on the drawings. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer.

B. Fault-Current Closing and Withstand Ratings: UL 1008 WCR ratings must be specifically listed as meeting the requirements for use with protective devices at installation locations, under specified fault conditions. Withstand and closing ratings shall be based on use of the same set of contacts for the withstand test and the closing test.

C. Solid-State Controls: All settings should be accurate to +/- 2% or better over an operating temperature range of - 40 to + 60 degrees C (- 40 to + 140 degrees F).

D. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.41. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.

E. Electrical Operation: Accomplished by a non-fused, momentarily energized solenoid or electric motor operator mechanism, mechanically and electrically interlocked in both directions (except that mechanical interlock is not required for closed transition switches).

F. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.

1. Switches using molded-case switches or circuit breakers, or insulated case circuit breaker components are not acceptable.
2. Transfer switches shall be double-throw, electrically and mechanically interlocked, and mechanically held in the Source 1 and Source 2 positions.
3. Main switch contacts shall be high-pressure silver alloy. Contact assemblies shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.
4. Contacts shall be operated by a high-speed electrical mechanism that causes contacts to open or close within three electrical cycles from signal.
5. The transfer switch operation shall include the ability to switch to an open position (both sources disconnected) for the purpose of load shedding from the generator set.
6. The power transfer mechanism shall include provisions for manual operation under load with the enclosure door closed. Manual operation may be electromechanical or mechanical, but must be coordinated with control function.
7. Transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with components that could be operating at line voltage levels.
8. The transfer switch shall include the mechanical and control provisions necessary to allow the device to be field-configured for operating speed. Transfer switch operation with motor loads shall be as is recommended in NEMA MG1.
    a. Phase angle monitoring/timing equipment is not an acceptable substitute for this functionality
9. Transfer switches designated on the drawings as “4-pole” shall be provided with a switched neutral pole switched which is switched simultaneously with phase poles.
10. Transfer switches designated on the drawings as “3-pole” shall have a full current-rated neutral bar with lugs.
11. Transfer switches designated on the drawings as “isolation-bypass” switches shall meet the requirements of section 2.4 of this specification.
12. Transfer switches designated on the drawings as “non-automatic” switches shall meet the requirements of section 2.5 of this specification.
13. Transfer switches designated on the drawings as “closed transition” switches shall meet the requirements of section 2.6 of this specification.
14. Transfer switches designated on the drawings as “service entrance” switches shall meet the requirements of section 2.7 of this specification.

G. Control: Transfer switch control shall be capable of communicating with the genset control, other switches and remote programming devices over a high-speed network interface.

H. Factory wiring: Transfer switch internal wiring shall be composed of pre-manufactured harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plug(s), to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism

I. Terminals: Terminals shall be pressure type and appropriate for all field wiring. Terminal arrangement and cabinet space must be such that feeder conductors can enter from the top, side or bottom of the switch, at the installer's discretion. Control wiring shall be equipped with suitable lugs, for connection to terminal strips.

J. Enclosures: All enclosures shall be third-party certified for compliance to NEMA ICS 6 and UL 508, unless otherwise indicated:

1. The enclosure shall provide wire bend space in compliance to the latest version of NFPA70, regardless of the direction from which the conduit enters the enclosure.
2. Exterior cabinet doors shall provide complete protection for the system's internal components. Doors must have permanently mounted key-type latches. Bolted covers or doors are not acceptable.
3. Transfer switches shall be provided in enclosures that are third party certified for their intended environment per NEMA requirements.

    a. Transfer switches mounted in a controlled indoor environment shall be provided in NEMA Type 1 enclosures (IEC type IP30).
    b. Transfer switches installed indoors shall be NEMA Type 12 (IEC type IP61) if the Project environment requires dust-proof and/or drip-proof equipment.
    c. Transfer switches located outdoors shall be supplied in NEMA Type 3R (IEC IP34) when dust-proof and/or rain-proof enclosures are required.
    d. Transfer switches that are installed outdoors or in any other uncontrolled environment shall be supplied with NEMA Type 4 or 4X (stainless steel) enclosures (IEC IP65).

2.3 AUTOMATIC TRANSFER SWITCHES

A. Comply with requirements for Level 1 equipment according to NFPA 110.

B. Indicated current ratings:

1. Refer to the Project drawings for specifications on the sizes and types of transfer switch equipment, withstand and closing ratings, number of poles, voltage and ampere ratings, enclosure type, and accessories.
2. Main contacts shall be rated for 600 VAC minimum.
3. Transfer switches shall be rated to carry 100% of rated current continuously in the enclosure supplied, in ambient temperatures of -40 to +60 degrees C (-40 to +140 degrees F), relative humidity up to 95% (non-condensing), and altitudes up to 10,000 feet (3000 meters).

C. Manual Switch Operation: The power transfer mechanism shall include provisions for manual operation under load with the enclosure door closed. Manual operation may be electromechanical or mechanical, but must be coordinated with control function

D. Relay Signal: Control shall include provisions for addition of a pre-transfer relay signal, adjustable from 0 to 60 seconds, to be provided if necessary for elevator operation, based on equipment provided for the project.

E. Control: Transfer switch control shall be provided with necessary equipment and software to communicate with the genset control, other transfer switches, remote annunciation equipment, and other devices over a high speed control network.

F. Neutral Switching: Transfer switches designated on the drawings as 4-pole shall be provided with a switched neutral pole. The neutral pole shall be of the same construction and have the same ratings as the phase poles. All poles shall be switched simultaneously using a common crossbar. Substitute equipment using overlapping neutral contacts is not acceptable.

G. Transfer switches that are designated on the drawings as 3-pole shall be provided with a neutral bus and lugs. The neutral bus shall be sized to carry 100% of the current designated on the switch rating.

H. The transfer switch physically located closest to the generator and not more than 50 ft (15 meters) away, except those served by generator paralleling equipment, shall be provided with a battery charger suitable for the requirements of the application and in compliance with NFPA 110 requirements for Level 1 systems. If no transfer switch is located within this distance, a battery charger shall be installed on the generator set.

I. Automatic Transfer Switch Control Features

1. The transfer switch control system shall be configurable in the field for any operating voltage level up to 600 VAC. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions that are not field configurable are not acceptable.
2. All transfer switch sensing shall be configurable from an operator panel or from a Windows XP or later PC-based service tool. Designs utilizing DIP switches or other electromechanical devices are not acceptable.
3. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device for load shedding purposes. On receipt of this signal, the transfer switch shall switch to a neutral position when connected to Source 2. If Source 1 is available when the load-shed signal is received, the transfer switch shall connect to Source 1.
4. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device to prevent transfer to the generator service.
5. The transfer switch shall provide a relay contact signal prior to transfer or re-transfer. The time period before and after transfer shall be adjustable in a range of 0 to 50 seconds.
6. The control system shall be designed and prototype tested for operation in ambient temperatures from - 40 degrees C to + 60 degrees C (- 40 to +140 degrees F). It shall be designed and tested to comply with the requirements of the noted voltage and RFI/EMI standards.
7. The control shall have optically isolated logic inputs, high isolation transformers for AC inputs and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.
8. The transfer switch network monitoring equipment, when supplied, shall be provided with a battery-based auxiliary power supply to allow monitoring of the transfer switch when both AC power sources are non-operational. The battery power supply shall be monitored for proper condition, and the transfer switch shall include an alarm condition to indicate low battery condition.

J. Transfer Switch Control Panel: The transfer switch shall have a microprocessor-based control with a sealed membrane panel incorporating pushbuttons for operator-controlled functions, and LED lamps for system status indicators. The panel shall also include an alphanumeric display for detailed system information. Panel display and indicating lamps shall include permanent labels.

1. The indicator panel LEDs shall display:
   a. Which source the load is connected to (Source 1 or Source 2)

b. Which source or sources are available
c. When switch is not set for automatic operation, because the control is disabled or the bypass switch is in use
d. When the switch is in test/exercise mode

2. The indicator shall have pushbuttons that allow the operator to activate the following functions:
   a. Activate pre-programmed test sequence
   b. Override programmed delays, and immediately go to the next operation
   c. Reset the control by clearing any faults
   d. Test all of the LEDs by lighting them simultaneously

3. The alphanumeric digital display shall be vacuum fluorescent-type, clearly visible in both bright sunlight and no-light conditions over an angle of 120 degrees, and shall display the following:
   a. AC voltage for all phases, normal and emergency
   b. Source status: connected or not connected.
   c. Load data, including voltage, AC current, frequency, KW, KVA, and power factor.

4. The display panel shall be password-protected, and allow the operator to view and make adjustments:
   a. Set nominal voltage and frequency for the transfer switch
   b. Adjust voltage and frequency sensor operation set points
   c. Set up time clock functions
   d. Set up load sequence functions
   e. Enable or disable control functions including program transition
   f. View real-time clock data, operation log (hours connected, times transferred, failures) and service history

K. Control Functions: Functions managed by the control shall include:

1. Software adjustable time delays:
   a. Engine start (prevents nuisance genset starts in the event of momentary power fluctuation): 0 to 120 seconds (default 3 sec)
   b. Transfer normal to emergency (allows genset to stabilize before load is transferred): 0 to 120 seconds (default 3 sec)
   c. Re-transfer emergency to normal (allows utility to stabilize before load is transferred from genset): 0 to 30 minutes (default 3 sec)
   d. Engine cooldown: 0 to 30 minutes (default 10 min)
   e. Programmed transition: 0 to 60 seconds (default 3 sec)

2. Undervoltage sensing: three-phase normal, three-phase emergency source.
   a. Pickup: 85 to 98% of nominal voltage (default 90%)
   b. Dropout: 75 to 98% of nominal voltage (default 90%)
   c. Dropout time delay: 0.1 to 1.0 seconds (default 0.5 sec)
   d. Accurate to within +/- 1% of nominal voltage

3. Over-voltage sensing: three-phase normal, three-phase emergency source.
   a. Pickup: 95 to 99% of dropout setting (default 95%)
   b. Dropout: 105 to 135% of nominal voltage (default 110%)
   c. Dropout time delay: 0.5 to 120 seconds (default 3 sec)
   d. Accurate to within +/- 1% of nominal voltage

4. Over/under frequency sensing:
   a. Pickup: +/- 5 to +/-20% of nominal frequency (default 10%)

b. Dropout: +/-1% beyond pickup (default 1%)
c. Dropout time delay: 0.1 to 15.0 seconds (default 5 sec)
d. Accurate to within +/- 0.2%

5. Voltage imbalance sensing:
   a. Dropout: 2 to 10% (default 4%)
   b. Pickup: 90% of dropout
   c. Time delay: 2.0 to 20 seconds (default 5 sec)

6. Phase rotation sensing:
   a. Time delay: 100 msec

7. Loss of single-phase detection:
   a. Time delay: 100 msec

L. Control features shall include:

1. Programmable genset exerciser: A field-programmable control shall periodically start the generator, transfer the load to generator for a preset time, then re-transfer and shut down the generator after a preset cool-down period.

   a. Push-button programming control shall have a selection of eight different schedules for exercising generator, with or without load.

2. In event of a loss of power to the control, all control settings, real-time clock setting and the engine start-time delay setting will be retained.
3. The system continuously logs information including the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. An event recorder stores information, including time and date-stamp, for up to 50 events.
4. Transfer Override Switch: Overrides automatic re-transfer control so automatic transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light to indicate override status.

M. Control Interface

1. Provide one set Form C auxiliary contacts on both sides, operated by transfer switch position, rated 10 amps 250 VAC.
2. The transfer switch shall be provided with a network communication card, and configured to allow network-based communication with the transfer switch and other network system components, including the generator set(s) provided for the Project.
3. Unassigned Auxiliary Contacts: Two normally open, 1-pole, double-throw contacts for each switch position, rated 10A at 240 VAC.

N. Engine Starting Contacts
1. One isolated and normally closed, and one isolated and normally open; rated 10A at 32 VDC minimum.

2.4 SERVICE ENTRANCE TRANSFER SWITCHES

A. Transfer switches must be specifically intended for service entrance applications, and labeled “Suitable for service entrance use only”
B. Transfer switch shall meet NEC requirements for emergency, legally required and standby applications as specified in UL 1008.

C. Entire transfer switch including enclosure must be listed and labeled to UL 1008; switches with only the mechanism listed are not acceptable.
D. Molded case circuit breaker must be UL 489 listed.

2.5 REMOTE ANNUNCIATOR SYSTEM

A. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches. Annunciation shall include the following:

1. Sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
2. Switch position.
3. Switch in test mode.
4. Failure of communication link.

B. Annunciator Panel: LED-lamp type with audible signal and silencing switch.

1. Indicating Lights: Grouped for each transfer switch monitored.
2. Label each group, indicating transfer switch it monitors, location of switch, and identity of load it serves.
3. Mounting: Flush, modular, steel cabinet, unless otherwise indicated.
4. Lamp Test: Push-to-test or lamp-test switch on front panel.

C. Malfunction of annunciator, annunciation and control panel, or communication link shall not affect functions of automatic transfer switch. In the event of failure of communication link, automatic transfer switch automatically reverts to stand-alone, self-contained operation.

D. Automatic transfer-switch sensing, controlling, or operating function shall not depend on remote panel for proper operation. The remote annunciation system shall not prevent transfer to the alternate source when the primary power source fails, nor prevent return to the primary source if the alternate source fails

PART 3 - EXECUTION

3.1 INSTALLATION

A. Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

B. Floor-Mounting Switch: Anchor to floor by bolting.

1. Floor-mounted transfer switches (except drawout switches supported by wheeled carriages, which must be rolled out at floor level) shall be mounted on concrete bases complying with the following requirements:

a. Concrete Bases: 4 inches (100 mm) high, reinforced, with chamfered edges. Extend base no more than 4 inches (100 mm) in all directions beyond the maximum dimensions of switch, unless otherwise indicated or unless required for seismic support. Construct concrete bases according to Division 26 Section "Hangers and Supports for Electrical Systems."

B. Annunciator and Control Panel Mounting: Flush in wall, unless otherwise indicated.

C. Identify components according to Division 26 Section "Identification for Electrical Systems."

D. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

3.2 CONNECTIONS

A. Wiring to Remote Components: Match type and number of cables and conductors to control and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.

B. Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

C. Transfer switch shall be provided with AL/CU mechanical lugs sized to accept the full output rating of the switch. Lugs shall be suitable for the number and size of conductors shown on the drawings.

D. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

E. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.3 SOURCE QUALITY CONTROL

A. Prior to shipping, factory shall test and inspect components, assembled switches, and associated equipment to ensure proper operation.

B. Factory shall check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements.

C. Factory shall perform dielectric strength test complying with NEMA ICS 1.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: The supplier of the transfer switch(es) and associated equipment shall inspect, test, and adjust components, assemblies, and equipment installations, including connections, and report results in writing.

B. Manufacturer's representative shall perform tests and inspections and prepare test reports.

C. After installing equipment and after electrical circuitry has been energized, installer shall test for compliance with requirements.

1. Perform recommended installation tests as recommended in manufacturer's installation and service manuals.
2. After energizing circuits, demonstrate interlocking sequence and operational function for each switch.

    a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
    b. Verify time-delay settings.
    c. Verify that the transfer switch is accurately metering AC voltage and current (when provided).

d. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
e. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

3. Ground-Fault Tests (if integral to transfer switch): Coordinate with testing of ground-fault protective devices for power delivery from both sources.

a. Verify grounding connections and locations and ratings of sensors.

D. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.

1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
3. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 DEMONSTRATION

A. After generator set installation, the generator and transfer switch supplier shall conduct a complete operation, basic maintenance, and emergency service seminar covering generator set and transfer switch equipment, for up to 10 people employed by the Owner.

1. The seminar shall include instruction on operation of the transfer equipment, normal testing and exercise, adjustments to the control system, use of the PC based service and maintenance tools provided under this contract, and emergency operation procedures.
2. The class duration shall be at least 8 hours in length, and include practical operation with the installed equipment.

3.6 SERVICE AND SUPPORT

A. The manufacturer shall supply the Owner with a complete set of the service and maintenance software required to support the product. The software shall be provided at a training class attended by the user, to qualify the user in proper use of the software. The software shall have the following features and capabilities:

1. The software shall be 32 bit and shall be XP and Vista compatible.
2. The software shall use the Windows Explorer format, for ease of use and commonality with other software in use at the facility.
3. The software shall allow adjustment of all functions described herein, adjustment of operating levels of all protective functions, and programming of all optional functions in the controller. Adjustments shall be possible over modem from a facility that is remote from the generator set.
4. The software shall be capable of storing and displaying data for any function monitored by the generator set control. This data shall be available in common file formats, and on graphical “strip chart” displays.
5. The software shall automatically record all control operations and adjustments performed by any operator or software user, for tracking of changes to the control.

6. The software shall display all warning, shutdown, and status changes programmed into transfer switch controller. For each event, the control shall provide information on the nature of the event, when it last occurred, and how many times it has occurred.

END OF SECTION

SECTION 26 41 00 - LIGHTNING PROTECTION SYSTEM

PART 1 - GENERAL

1.1 Furnish and install a complete and operable Lightning Protection System meeting the requirements of NFPA 780, UL 96A, LPI 175, and all other applicable federal, state, and local codes. The contract drawings are provided to give a general scope of the work. The actual system installed shall be based on shop drawings created by a Contractor-selected Lightning Protection System company with no less than five years experience designing and installing lightning protection systems on projects of similar size and scope. The Lightning Protection System shall be a UL Master-labeled system.

1.2 Class II Materials, as defined by NFPA 780 shall be used for any structure that exceeds 75 feet in height. Class I Materials may be used for the shorter structures on the site as permitted by NFPA 780.

1.3 Products listed on the drawings are manufactured by AC Erico. The materials shown are provided to indicate a standard of quality and should not be interpreted as limiting competition. Products of other manufacturers will be acceptable provided they are of equivalent style and quality.

1.4 Provide all materials, equipment, and labor required to install, configure, and test the entire system to the satisfaction of the Architect and Engineer. Include all attachments, flashing, roof penetrations, closures, and other items for complete watertight installation. Coordinate installation with roofing contractor.

1.5 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including complete construction details. Coordinate with the architectural and structural drawings to determine exact material types for each conductor, connector, air terminal, support, etc. Show manufacturer's part number, material type, and method of installation including bolt and anchor materials and sizes.

PART 2 - PRODUCTS

2.1 Products shown on the drawings represent the minimum requirements for the project. Provide additional equipment as required by codes and standards for a complete UL Master-labeled system.

2.2 Conductors: Conductors shall be copper throughout the system except where they will be in contact with aluminum or other aluminum alloy metals. All conductors in contact with concrete or earth shall be copper. The conductor sizes and types shall be Class II in accordance with NFPA 780 for portions of the building exceeding 75 feet in height. They shall be Class I in accordance with NFPA 780 where allowed by this code.

2.3 Connectors: Connectors shall be selected based on the conductor type that they will be supporting and the material on which they will be mounted. Coordinate with architectural and structural drawings during the creation of shop drawings to determine material types and exact connector types for each location.

2.4 Conduits: Conduits shall be schedule 80 PVC with a UV inhibitor. Size conduits for conductors which they will protect.

PART 3 - EXECUTION

3.1 All work shall be done by qualified technicians.

3.2 All downlead conductors shall be routed inside walls in PVC-conduit. Bond to structural steel outside of PVC-conduit as required by codes. Downleads shall not be run exposed on the outside of the buildings. Make transitions from aluminum to copper conductors on the roof area only. All downlead conductors shall be copper.

3.3 The Electrical Contractor shall not penetrate the roof or walls. Where such penetrations are required, employ the appropriate contractor on the project responsible for such work to provide and seal such penetrations.

3.4 Connect lightning protection system to the electrical power system ground with a main-size copper lightning protection cable exothermically welded to the electrical power system ground rod.

3.5 Guarantee workmanship and material for a period of one year after final acceptance. During the warranty period, repair or replace faulty equipment at no cost to the Owner for labor, material, or expenses.

3.6 Upon completion of job, test entire system for ground resistance. After testing submit a certificate to Architect stating that the system has been installed in strict compliance with all applicable codes and manufacturer's guidelines.

PART 4 – CLOSE-OUT DOCUMENTS

Provide the following documents to the Architect for delivery to the Owner at the time of substantial completion:

A. Written Guarantee

B. Two sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, shop drawings, wiring diagrams, maintenance procedures, and other literature required for operation and maintenance.

C. Certificate indicating the system bares the UL Master-label.

END OF SECTION

SECTION 26 43 00 - SURGE PROTECTIVE DEVICES (SPDs)

PART 1 – GENERAL

1.1 SCOPE

A. The Contractor shall furnish and install the Surge Protective Device (SPD) equipment having the electrical characteristics, ratings, and modifications as specified herein and as shown on the contract drawings. To maximize performance and reliability and to obtain the lowest possible let-through voltages, the ac surge protection shall be integrated into electrical distribution equipment such as switchgear, switchboards, panelboards, busway (integrated within bus plug), or motor control centers. Refer to related sections for surge requirements in:

1.2 RELATED SECTIONS

A. Section 26 24 00 – Panelboards

1.3 REFERENCES

A. SPD units and all components shall be designed, manufactured, and tested in accordance with the latest applicable UL standard (ANSI/UL 1449 3rd Edition).

1.4 SUBMITTALS – FOR REVIEW/APPROVAL

A. The following information shall be submitted to the Engineer:

1. Provide verification that the SPD complies with the required ANSI/UL 1449 3rd Edition listing by Underwriters Laboratories (UL) or other Nationally Recognized Testing Laboratory (NRTL). Compliance may be in the form of a file number that can be verified on UL's website or on any other NRTL's website, as long as the website contains the following information at a minimum: model number, SPD Type, system voltage, phases, modes of protection, Voltage Protection Rating (VPR), and Nominal Discharge Current (I_n).
2. For sidemount mounting applications (SPD mounted external to electrical assembly), electrical/mechanical drawings showing unit dimensions, weights, installation instruction details, and wiring configuration.

B. Where applicable the following additional information shall be submitted to the engineer:

1. Descriptive bulletins
2. Product sheets

1.5 SUBMITTALS – FOR CONSTRUCTION

A. The following information shall be submitted for record purposes:

1. Final as-built drawings and information for items listed in Section 1.04 and shall incorporate all changes made during the manufacturing process

1.6 QUALIFICATIONS

A. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

B. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

D. The SPD shall be compliant with the Restriction of Hazardous Substances (RoHS) Directive 2002/95/EC.

1.7 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer's instructions. One (1) copy of manufacturer's instructions shall be included with the equipment at time of shipment.

1.8 OPERATION AND MAINTENANCE MANUALS

A. Operation and maintenance manuals shall be provided with each SPD shipped.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Eaton Cutler-Hammer

The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Engineer ten (10) days prior to bid date.

2.2 VOLTAGE SURGE SUPPRESSION – GENERAL

B. Electrical Requirements

1. Unit Operating Voltage – Refer to drawings for operating voltage and unit configuration.
2. Maximum Continuous Operating Voltage (MCOV) – The MCOV shall not be less than 125% of the nominal system operating voltage.
3. The suppression system shall incorporate thermally protected metal-oxide varistors (MOVs) as the core surge suppression component for the service entrance and all other distribution levels. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may crowbar the system voltage leading to system upset or create any environmental hazards.
4. Protection Modes – The SPD must protect all modes of the electrical system being utilized. The required protection modes are indicated by bullets in the following table:

	Protection Modes			
Configuration	L-N	L-G	L-L	N-G
Wye	●	●	●	●
Delta	N/A	●	●	N/A
Single Split Phase	●	●	●	●
High Leg Delta	●	●	●	●

5. Nominal Discharge Current (I_n) – All SPDs applied to the distribution system shall have a 20kA I_n rating regardless of their SPD Type (includes Types 1 and 2) or operating voltage. SPDs having an I_n less than 20kA shall be rejected.
6. ANSI/UL 1449 3rd Edition Voltage Protection Rating (VPR) – The maximum ANSI/UL 1449 3rd Edition VPR for the device shall not exceed the following:

Modes	208Y/120	480Y/277	600Y/347
L-N; L-G; N-G	700	1200	1500
L-L	1200	2000	3000

C. SPD Design

1. Maintenance Free Design – The SPD shall be maintenance free and shall not require any user intervention throughout its life. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.
2. Balanced Suppression Platform – The surge current shall be equally distributed to all MOV components to ensure equal stressing and maximum performance. The surge suppression platform must provide equal impedance paths to each matched MOV. Designs incorporating replaceable SPD modules shall not be accepted.
3. Electrical Noise Filter – Each unit shall include a high-performance EMI/RFI noise rejection filter. Noise attenuation for electric line noise shall be up to 50 dB from 10 kHz to 100 MHz using the MIL-STD-220A insertion loss test method. Products unable able to meet this specification shall not be accepted.
4. Internal Connections – No plug-in component modules or printed circuit boards shall be used as surge current conductors. All internal components shall be soldered, hardwired with connections utilizing low impedance conductors.
5. Monitoring Diagnostics – Each SPD shall provide the following integral monitoring options:
   a. Protection Status Indicators - Each unit shall have a green / red solid-state indicator light that reports the status of the protection on each phase.

      i. For wye configured units, the indicator lights must report the status of all protection elements and circuitry in the L-N and L-G modes. Wye configured units shall also contain an additional green / red solid-state indicator light that reports the status of the protection elements and circuitry in the N-G mode. SPDs that indicate only the status of the L-N and L-G modes shall not be accepted.

      ii. For delta configured units, the indicator lights must report the status of all protection elements and circuitry in the L-G and L-L modes.

      iii. The absence of a green light and the presence of a red light shall indicate that damage has occurred on the respective phase or mode. All protection status indicators must indicate the actual status of the protection on each phase or mode. If power is removed from any one phase, the indicator lights must continue to indicate the status of the protection on all other phases and protection modes. Diagnostics packages that simply indicate whether power is present on a particular phase shall not be accepted.

   b. Remote Status Monitor – The SPD must include Form C dry contacts (one NO and one NC) for remote annunciation of its status. Both the NO and NC contacts shall change state under any fault condition.

c. Audible Alarm and Silence Button – The SPD shall contain an audible alarm that will be activated under any fault condition. There shall also be an audible alarm silence button used to silence the audible alarm after it has been activated.

d. ∃Surge Counter – The SPD shall be equipped with an LCD display that indicates to the user how many surges have occurred at the location. The surge counter shall trigger each time a surge event with a peak current magnitude of a minimum of 50 ± 20A occurs. A reset pushbutton shall also be standard, allowing the surge counter to be zeroed. The reset button shall contain a mechanism to prevent accidental resetting of the counter via a single, short-duration button press. In order to prevent accidental resetting, the surge counter reset button shall be depressed for a minimum of 2 seconds in order to clear the surge count total.

i. The ongoing surge count shall be stored in non-volatile memory. If power to the SPD is completely interrupted, the ongoing count indicated on the surge counter's display prior to the interruption shall be stored in non-volatile memory and displayed after power is restored. The surge counter's memory shall not require a backup battery in order to achieve this functionality.

6. Overcurrent Protection

a. The unit shall contain thermally protected MOVs. These thermally protected MOVs shall have a thermal protection element packaged together with the MOV in order to achieve overcurrent protection of the MOV. The thermal protection element shall disconnect the MOV(s) from the system in a fail-safe manner should a condition occur that would cause them to enter a thermal runaway condition.

7. Fully Integrated Component Design – All of the SPD's components and diagnostics shall be contained within one discrete assembly. SPDs or individual SPD modules that must be ganged together in order to achieve higher surge current ratings or other functionality shall not be accepted.

8. Safety Requirements

a. The SPD shall minimize potential arc flash hazards by containing no user serviceable / replaceable parts and shall be maintenance free. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.

b. SPDs designed to interface with the electrical assembly via conductors shall require no user contact with the inside of the unit. Such units shall have any required conductors be factory installed.

c. Sidemount SPDs shall be factory sealed in order to prevent access to the inside of the unit. Sidemount SPDs shall have factory installed phase, neutral, ground and remote status contact conductors factory installed and shall have a pigtail of conductors protruding outside of the enclosure for field installation.

2.3 SYSTEM APPLICATION

A. The SPD applications covered under this section include distribution and branch panel locations, busway, motor control centers (MCC), switchgear, and switchboard assemblies. All

SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments.

B. Surge Current Capacity – The minimum surge current capacity the device is capable of withstanding shall be as shown in the following table:

Minimum surge current capacity based on ANSI / IEEE C62.41 location category			
Category	Application	Per Phase	Per Mode
C	Service Entrance Locations (Switchboards, Switchgear, MCC, Main Entrance)	250 kA	125 kA
B	High Exposure Roof Top Locations (Distribution Panelboards)	160 kA	80 kA
A	Branch Locations (Panelboards, MCCs, Busway)	120 kA	60 kA

C. SPD Type – all SPDs installed on the line side of the service entrance disconnect shall be Type 1 SPDs. All SPDs installed on the load side of the service entrance disconnect shall be Type 1 or Type 2 SPDs.

2.4 LIGHTING AND DISTRIBUTION PANELBOARD REQUIREMENTS

A. The SPD application covered under this section includes lighting and distribution panelboards. The SPD units shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category B environments.

1. The SPD shall not limit the use of through-feed lugs, sub-feed lugs, and sub-feed breaker options.
2. SPDs shall be installed immediately following the load side of the main breaker. SPDs installed in main lug only panelboards shall be installed immediately following the incoming main lugs.
3. The panelboard shall be capable of re-energizing upon removal of the SPD.
4. The SPD shall be interfaced to the panelboard via a direct bus bar connection. Alternately, an SPD connected to a 30A circuit breaker for disconnecting purposes may be installed using short lengths of conductors as long as the conductors originate integrally to the SPD. The SPD shall be located directly adjacent to the 30A circuit breaker.
5. The SPD shall be included and mounted within the panelboard by the manufacturer of the panelboard.
6. The SPD shall be of the same manufacturer as the panelboard.
7. The complete panelboard including the SPD shall be UL67 listed.

B. Sidemount Mounting Applications Installation (SPD mounted external to electrical assembly)
1. Lead length between the breaker and suppressor shall be kept as short as possible to ensure optimum performance. Any excess conductor length shall be trimmed in order to minimize let-through voltage. The installer shall comply with the manufacturer's recommended installation and wiring practices.

C. Switchgear, Switchboard, MCC and Busway Requirements

1. The SPD application covered under this section is for switchgear, switchboard, MCC, and busway locations. Service entrance located SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C environments.

2. The SPD shall be of the same manufacturer as the switchgear, switchboard, MCC, and busway
3. The SPD shall be factory installed inside the switchgear, switchboard, MCC, and/or bus plug at the assembly point by the original equipment manufacturer
4. Locate the SPD on the load side of the main disconnect device, as close as possible to the phase conductors and the ground/neutral bar.
5. The SPD shall be connected through a disconnect (30A circuit breaker). The disconnect shall be located in immediate proximity to the SPD. Connection shall be made via bus, conductors, or other connections originating in the SPD and shall be kept as short as possible.
6. The SPD shall be integral to switchgear, switchboard, MCC, and/or bus plug as a factory standardized design.
7. All monitoring and diagnostic features shall be visible from the front of the equipment.

2.5 ENCLOSURES

A. All enclosed equipment shall have NEMA 1 general purpose enclosures, unless otherwise noted. Provide enclosures suitable for locations as indicated on the drawings and as described below:

1. NEMA 1 – Constructed of a polymer (units integrated within electrical assemblies) or steel (sidemount units only), intended for indoor use to provide a degree of protection to personal access to hazardous parts and provide a degree of protection against the ingress of solid foreign objects (falling dirt).
2. NEMA 4 – Constructed of steel intended for either indoor or outdoor use to provide a degree of protection against access to hazardous parts; to provide a degree of protection of the equipment inside the enclosure against ingress of solid foreign objects (dirt and windblown dust); to provide a degree of protection with respect to the harmful effects on the equipment due to the ingress of water (rain, sleet, snow, splashing water, and hose directed water); and that will be undamaged by the external formation of ice on the enclosure. (sidemount units only)
3. NEMA 4X – Constructed of stainless steel providing the same level of protection as the NEMA 4 enclosure with the addition of corrosion protection. (sidemount units only)

PART 3 – EXECUTION

3.1 EXAMINATION

3.2 FACTORY TESTING

A. Standard factory tests shall be performed on the equipment under this section. All tests shall be in accordance with the latest version of NEMA and UL standards.

3.3 INSTALLATION

A. The Contractor shall install all equipment per the manufacturer’s recommendations and the contract drawings.

3.4 WARRANTY

A. The manufacturer shall provide a full ten (10) year warranty from the date of shipment against any SPD part failure when installed in compliance with manufacturer’s written instructions and any applicable national or local code.

END OF SECTION

SECTION 26 51 00 - LIGHTING

PART 1 – GENERAL

1.1 Provide all lighting fixtures (luminaires), lamps, end caps, connectors, fittings, structural support members, supports, brackets, etc., for a complete and operable lighting system.

1.2 Prior to submitting electrical equipment brochures for review and approval, coordinate with the General Contractor and verify that the fixtures are appropriate for the ceiling types in which they are shown to be installed. Also verify that ballast voltage on the submittals is appropriate for the electrical system on which the fixtures are to be installed (regardless of voltage listed in the part number in the Fixture Schedule). Submit with equipment brochures a certificate stating that these items of coordination have been completed.

PART 2 – PRODUCTS

2.1 LUMINAIRES

A. Luminaires are shown in the Luminaire Schedule on the drawings to establish a standard of quality. Manufacturer's names and model numbers shall not be interpreted as a proprietary specification. Notify the engineer at least two weeks prior to bid if an equivalent for a fixture listed in the schedule is not readily available,

B. Prior to submitting electrical equipment brochures for review and approval, coordinate with the General Contractor and verify that the fixtures are appropriate for the ceiling types in which they are shown to be installed. Also verify that ballast voltage on the submittals is appropriate for the electrical system on which the fixtures are to be installed (regardless of voltage listed in the part number in the Fixture Schedule). Submit with equipment brochures a certificate stating that these items of coordination have been completed.

2.2 LAMPS

A. Incandescent lamps shall be rated 125V and shall be of the appropriate size with the appropriate base configuration for installation in the fixture specified. Incandescent lamps shall be clear unless otherwise specified.

B. T8 fluorescent lamps shall be rapid-start with a Color Rendering Index (CRI) of 75 and a color temperature of 3500K.

C. T5 & T5HO fluorescent lamps shall be rapid-start with a Color Rendering Index (CRI) of 82 and a color temperature of 3500K.

D. HID Lamps shall be clear unless otherwise noted. They shall have a color temperature of 3500K. Coordinate base size with fixture socket prior to ordering lamps.

E. LED lamps shall be LM79 and LM80 tested.

2.3 BALLASTS

A. Fluorescent luminaires shall be furnished with energy-saving, high power factor (0.9 or greater), electronic ballasts. Ballasts shall operate lamps without noticeable flicker and shall operate within the IES recommended noise levels. Ballasts shall operate at a frequency no less than 20,000 Hz. Total harmonic distortion shall be less than 10%. Ballasts shall be able to withstand voltage transients in accordance with IEEE C62.41, Category A for normal and common modes. Ballasts shall be compatible with the lamps furnished. Furnish number and

size of ballasts as required to operate the number of lamps indicated with the control schemes shown.

B. Fluorescent ballasts for light fixtures controlled by occupancy sensors shall be programmed start ballasts with the lamps wired in parallel. Failure of one lamp shall leave the rest of the lamps illuminated.

C. Emergency Ballasts: Emergency Ballasts in fluorescent fixtures shall consist of an automatic power failure device, a test switch, and a pilot light that is visible from outside of the fixture. They shall contain a fully automatic solid state charger in a self-contained power pack. The fixture shall be factory wired in a manner that will allow the emergency lamps to be switched while still maintaining charging power to the battery. Wiring Diagrams shall be furnished with the fixture showing switching connections. The battery shall be of the sealed electrolyte type with the capacity to provide power to the lamps provided for a minimum of 90 minutes at a minimum output as indicated below:

Linear and U-Tube T-8 and T-12 Lamps	1100 Lumens
26W DTT	970 Lumens
26W TRT	450 Lumens
32W TRT	575 Lumens
42W TRT	1000 Lumens

The battery shall be able to operate unattended with no maintenance for a period of no less than five years. Emergency ballasts shall be fully compatible with solid state ballasts. Battery packs shall be mounted inside the fixture unless remotely mounted ballasts are shown on the drawings, or unless the fixture is of a type that does not have room for internally mounted battery packs.

D. HID ballasts shall be of the high power factor type (0.9 or greater).

E. Where quartz restrike fixtures are fed at voltages different than 120V, they shall be furnished with integral transformers and all equipment necessary to feed the quartz fixtures at 120V.

2.4 SUPPORTS

A. Provide all structural members necessary to support fixtures in locations shown on the contract drawings. Submit mounting and support details to the Architect or Engineer for approval with the project shop drawings. Notify the General Contractor prior to bid of any structural work that will be required to support the fixtures.

B. Provide hangers, cords, stems, etc., where required. Coordinate with the Architect or Engineer for proper stem lengths prior to ordering fixtures.

C. Recessed lay-in fixtures shall be supported at all four corners independent of the ceiling grid.

D. Provide clips for fixtures installed in lay-in ceilings. Clips shall be equal to Erico Caddy clips # 515 or #515A.

PART 3 – EXECUTION

3.1 Raceways for lighting systems in accessible ceilings shall be run to junction boxes mounted in locations that do not interfere with the ceiling installation, the luminaire installation, or other building systems. Provide final connections to fixtures using conductors in flexible conduit. Flexible conduit whips shall not exceed six feet in length.

3.2 All recessed fixtures shall be mounted with their trims flush against the ceiling.

3.3 Comply completely with all manufacturers' installation instructions.

3.4 Fixture lengths shall be measured and submitted to the manufacturer in accordance with the manufacturer's installation requirements. Fixtures shall be of exact lengths required for the application as determined during construction. Fixtures shall be installed to the Owner, Architect, and Engineer's satisfaction.

3.5 Fixtures shall be warranted for a period of one year after beneficial occupancy. Incandescent lamps shall be warranted for 90 days after beneficial occupancy. Fluorescent and HID lamps shall be warranted for 180 days after beneficial occupancy. LED lamps shall be warranted for a period of two years after beneficial occupancy.

END OF SECTION

SECTION 26 51 01 - MOTION DETECTORS

PART 1 GENERAL

1.1 Furnish and install a complete system of Motion Detectors as shown on the drawings and as specified herein. The drawings are provided to show the general scope of the work, and show the absolute minimum components required. Actual system components, quantities, and locations shall be determined by the motion detector vendor and provided to the Contractor with the installation shop drawings.

1.2 The Contractor and Sales Representatives are advised to take notice of specified component characteristics when attempting to select and propose substitutions. It is highly unlikely that substitutions on a one-for-one component basis will produce results that provide acceptable system performance.

1.3 Provide all power packs, hardware, software, devices, circuitry, and other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer.

1.4 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable. Shop drawings shall be provided whether the contractor provides specified components or materials of other manufacturers.

PART 2 PRODUCTS

2.1 Motion detectors shall be furnished with the manufacture and model number shown on the drawings or an approved equal.

2.2 Power Packs: Power packs shall be of the same manufacturer as the motion detectors. Each shall be capable of controlling a 20 ampere circuit. They shall be rated for operation at the voltage of the system on which they will be used.

2.3 Circuitry: Provide control circuitry as required by the manufacturer for optimum system operation, but no less than the following: Control cables shall be 3-conductor #22 AWG copper with an overall jacket. Adjust conductor sizes as required to overcome unacceptable voltage drop.

PART 3 EXECUTION

3.1 Motion detectors shall be provided so that their coverage areas overlap and there are no dead zones in the rooms where persons may stand and not be detected.

3.2 All work shall be done by qualified system technicians.

3.3 Wiring, including control wiring, shall be in Raceways meeting Specification.

3.4 Guarantee workmanship and material for a period of one year after final acceptance. During the warranty period, repair or replace faulty equipment at no cost to the Owner for labor, material, or expenses.

3.5 Upon completion of job, test entire system. After testing, submit a certificate to the Architect stating

verification of the following:

A. All devices have been tested and are working properly.

PART 4 CLOSE-OUT DOCUMENTS

4.1 Provide the following documents to the Architect for delivery to the Owner at the time of substantial completion:

A. Written Guarantee

B. Two sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, a description of operation, shop drawings, wiring diagrams, maintenance procedures, and other literature required for operation and maintenance of equipment.

4.2 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written step-by-step instructional material.

4.3 Notify the General Contractor that you are to present during the Pre-final Inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels covers as required to show the quality of the installation. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 27 05 13 - CABLE TELEVISION

PART 1 - GENERAL

1.01 SCOPE OF WORK:

A. Provide a complete and operable Cable Television System including, but not limited to, cabling, conduits, raceways, boxes, outlets, jacks, splitters, preamplifiers, amplifiers, and attenuators.

B. Comply completely with all Cable Company requirements. Include all costs associated with this compliance in bid. Notify Architect at least ten days prior to bid if Cable Company requirements differ from those described in the construction documents.

PART 2 - PRODUCTS

1. Cable for Distribution from Terminal Blocks to Outlet Jacks: Television cable shall be plenum-rated double-shielded RG6/U, #18 AWG bare copper with an aluminum polyester aluminum tape with 100% coverage and an aluminum braid with 45% coverage.

2. Jacks: Outlet boxes shall be flush mounted. Each shall be equipped with a cover plate containing a type F female connector.

3. Conduit shall be sized per the NEC for the number of cables provided, but no less than ¾" nominal trade size.

4. Conduit shall comply with the RACEWAYS specification.

5. Terminal Board: Provide a ¾" x 48" x 48" sheet of plywood, primed, and coated with two coats of enamel paint (consult architect for color and finish texture). Verify terminal board requirements with local cable company.

6. Terminal Blocks: Provide terminal blocks for termination of the Local Cable Television Cables at the New Terminal Board having the number of outlets required to serve the outlets provided in this contract plus 10% spare. Provide terminators as required on the spare outlets.

7. Amplifiers, Preamplifiers, and Attenuators: Provide amplifiers, preamplifiers, and attenuators as required for optimum system operation.

PART 3 - EXECUTION

3.01 CONDUIT ROUTING:

A. Interior conduits for the Cable Television System shall extend from the wall outlets and terminate with a bushing above the cable tray.

B. Provide a 4" PVC conduit from the Main Telephone Data Backboard to the right-of-way for the Cable Television Service. Use only long radius bends. Provide the conduit with a pull string. Coordinate with the cable company to have cable service provided to the building. Pay all costs associated with having the cable service connected.

3.02 CABLING:

Homerun one cable from each Type F jack in each outlet box to the nearest telephone data backboard. Terminate one cable on the terminal block, or amplifier, for Local Cable Television Service.

3.03 WORKMANSHIP & TESTING:

A. Provide a television set and test each outlet for a clear signal and proper operation. Demonstrate operation of the television set at each jack in the presence of the Architect. Provide a typewritten log listing each outlet jack and obtain the Architect's signature as evidence that you have demonstrated proper operation of the system.

B. All work shall be performed by competent technicians trained and experienced for at least two years in the installation of telephone equipment.

C. The Architect and/or Owner may reject work that performs unsatisfactorily or that is not installed to be aesthetically pleasing.

END OF SECTION

SECTION 27 30 00 - TELEPHONE AND DATA SYSTEMS

PART 1 – GENERAL

1.1 Provide complete telephone and data systems in accordance with this specification and the contract drawings. All systems shall be furnished and installed to meet or exceed EIA/TIA Category 6 Standards.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 All new wiring on this project shall conform to the EIA TIA 568A T568A or T568B scheme. **Verify with Owner's representative at the coordination meeting which termination configuration to use.**

1.4 Prior to ordering equipment, provide six sets of manufacturer's cut sheets to the Architect or Engineer for the equipment to be installed. Also submit shop drawings showing the floor plan with all wiring tag identification and conduit and cable routing. Do not order any equipment without receiving submittals and shop drawings that have been reviewed and approved by the Engineer.

1.5 Contractors furnishing and installing telephone and data system components shall be regularly involved in furnishing and installing systems of the type specified. They shall have installed five systems similar in size and scope within the past six months. The Telephone and Data System Contractor shall pull the cable as well as install all jacks and make all other system terminations.

PART 2 – PRODUCTS

2.1 Outlet Boxes: Provide outlet boxes in accordance with Specification 26 05 33.

2.2 Plaster Rings: Plaster rings shall be furnished to provide single-gang openings in outlet boxes unless otherwise noted.

2.3 Raceways: Provide raceways in accordance with Specification 26 05 33.

2.4 Jacks: Provide outlet boxes with a strap containing the number of Jacks indicated on the drawings. Outlet jacks shall be 8-position, 8-conductor, RJ-45 jacks that are multivendor supportive accepting most phone and data plugs. Jacks shall have gold-plated (50 microinches minimum) contacts with 110 connections on the back. The jacks shall snap in the straps. The straps shall be colored to match the switches and receptacle color selected by the Architect. The straps shall be covered by a stainless steel wallplate identical to those of the receptacles and switches. Telephone outlet jacks shall be yellow; data jacks shall be blue.

2.5 Cable: All cable shall be Category 6 rated and shall conform to or exceed the EIA/TIA 578 Commercial Building Wiring Standard, Horizontal Cable Section and the EIA/TIA Technical Systems Bulletin 36 for Unshielded Twisted Pair Cables. Other standards supported shall include IEEE 802.3, Ibase5, 10BASE-T; IEEE 802.5, 4 Mbps, 16 Mbps (328 ft/100m), 104 Workstations, proposed ANSI X3T9.5 TP-PMD requirements for UTP at 100 Mbps, and 155 MB ATM. Cabling

shall be UL listed. Telephone cables shall be yellow; data cables shall be blue. All Cable shall be plenum rated.

2.6 Telephone and Data Backboard (TDBB): Wall mount a ¾" x 4' x 4' sheet of fire retardant plywood, primed and painted with two coats of fire retardant paint of the color and finish selected by the Architect. Do not paint over the fire retardant stamp. Provide a ¼" x 4" x 17.75" copper ground block (Erico Eritech TMGB-A18L23PT or approved equal) on the wall, bond a #2 AWG copper conductor to the ground block with a two hole compression lug and run the #2 AWG ground wire to the electrical power system ground. Bond the #2 AWG ground wire to the power system electrode using an exothermic weld.

2.7 Punchdown Blocks: Telephone cables shall terminate at the Telephone & Data Backboard on Punchdown Blocks. Telephone Cabling shall be terminated on 110 punchdown blocks maintaining the Category 6 rating. Furnish punchdown blocks for all telephone outlets in this contract plus 25% additional outlets.

2.8 Patch Panels: Data Cables shall terminate at the Telephone & Data Backboard in patch panels. Provide a patch panel (or panels) at each TDBB to accommodate all cabling plus 15% spare capacity. Provide crossconnecting cables as required to interconnect the patch panels providing the Owner a single connection point for a connection to a server.

2.9 Racks: Provide a freestanding, minimum 78" tall, 19" rack for mounting of the patch panels. The rack shall be mounted on the floor in front of the TDBB.

PART 3 – EXECUTION

3.1 Provide a 1" conduit extending from each outlet box to a point above equipment rack. Terminate the conduit with a protective bushing.

3.2 Route conductors from the outlet box to the patch panels through the conduits.

3.3 Provide a minimum of two data cables to each data outlet or combination telephone/data outlet. Provide one cable to each telephone outlet.

3.4 Mount plywood backboard securely to wall framing members. The bottom of the backboard shall be 6" above the finished floor.

3.5 Provide a #2 copper ground wire in 1" PVC conduit from the Telephone and Data Backboard to the Building Power System Ground.

3.6 Service Conduits: Provide two 4" PVC conduits with long radius elbows from the Telephone and Data Backboard to a point 5' outside of the building. These conduits shall be for future use by the Owner. Conduits bends shall contain radii that are no less than 10 times the conduit diameter. Furnish conduits with pullstrings. Stub conduits up 4" above the floor at the Telephone and Data Backboard and cover with plastic caps. Do not glue the caps on the conduits. Seal conduits below grade to prohibit the entrance, of dirt, water, and gases. Service conduits shall be buried 24" to 36" below grade. Mark the end of the conduits by placing a vertical stick of conduit from the end of the conduit vertically to a point at least 12" above grade. Provide physical protection as well as warning tape attached to stakes around the marker.

Equip all spare conduits with a pullwire or string capable of withstanding 500 pounds of pulling tension.

3.7 Uniquely identify and label all cables at each end using EIA/TIA Standards. Provide engraved or professionally stenciled label markings on the faceplate beside each jack.

3.8 Test each cable for opens, shorts, correct pairs, crossed wiring, and proper termination using a CT200 tester from Atcom Services, Inc. or approved equal. Replace any cable that is unable to pass the tests. Provide a written log of the test results of each cable to the Engineer at the prefinal inspection. Demonstrate testing of any cables selected by the Engineer.

END OF SECTION

SECTION 27 51 13 - PAGING SYSTEM

PART 1 – GENERAL

1.1 Provide a complete and operable Paging System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide. This specification requires the furnishing vendor to appropriately size the amplifier for the speakers to be provided.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 The Paging System shall consist of all components necessary to provide paging through the Owner's telephone system. Minimum system components shall include speakers, circuitry, an amplifier, and a telephone interface module. Provide all additional equipment, material, circuitry, labor, etc. for a complete and operable Paging System.

1.4 Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the intercom equipment prior to bid. The Electrical Contractor shall include all costs for powering the intercom equipment in the bid.

1.5 The specification provided is intended to establish a standard of quality – not to limit competition. Equivalent systems of other manufacturers will be acceptable. Gain approval of other manufacturers at least 10 days prior to bid. Acceptance of the manufacturer does not ensure that the actual components submitted after bid will be considered equivalent.

1.6 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

1.02 SUBMITTALS:

Submit six sets of the following documents to the Architect for the Engineer's review and approval prior to ordering any equipment:

A. Technical specification sheets on each equipment item.
B. Complete wiring diagram indicating wire and cable numbers, terminal strip designations, and equipment model numbers.
C. Equipment mounting elevations.
D. Single line diagram.
E. Floor plans showing all equipment locations and conduit routing.
F. Amplifier Sizing Calculations

1.03 QUALIFICATIONS:

A. The Contractor furnishing and installing the system shall be a licensed distributor for the

system being installed. The Contractor shall regularly provide systems of the size, scope, and quality specified.

B. The Contractor shall have completed five projects in the last 2 years of the same complexity and dollar value.

C. The Contractor shall employ qualified electronic technicians, trained in the installation, setup, and repair of systems of the type specified.

PART 2 - PRODUCTS

2.01 All equipment shall be new, U.L. listed equipment.

2.02 Ceiling-Mounted Speakers shall be 8 inch, 6 oz., flush ceiling mount speakers with 70V impedance-matching transformers and integral volume control. Speakers shall be Bogen S86T725-BRV-CG8AW or approved equal. Furnish speakers complete with backboxes, T-grid ceiling supports where required, and aluminum baffle finished with semi-gloss white enamel. Provide appropriate mounting hardware for ceiling into which the individual speakers will be installed.

2.03 Horn Type Speakers shall be weatherproof, 15 watt horn type speakers with a 70V transformer. Horn Type Speakers shall be Bogen SPT-15A or approved equal.

2.04 Amplifier: Bogen TPU15A, TPU35B, TPU60B, TPU100B, TPU250, or approved equal. Size the amplifier for system speakers provided assuming that all are set at their highest tap. Provide attenuators as required to protect speakers from excess power.

2.05 Provide an appropriate telephone interface module at the telephone and data backboard to allow all-call pages to be made via the Owner’s telephone system.

2.06 Mounting Bracket: Mount the amplifier on the telephone and data backboard with a metallic mounting bracket manufactured for the purpose.

2.07 Terminal Blocks: All conductors in cabinets, on equipment racks, etc. shall be terminated on Siemens 66M1-50 punch blocks or approved equal.

2.08 Speaker Cabling: All speaker cabling shall be stranded, twisted, shielded pairs with PVC jacket and a tinned copper drain wire. The shield shall be an aluminum polyester foil providing 100% coverage. The conductors shall be sized as required for system to function appropriately, but shall not be less than #22 AWG.

2.09 Conduit shall be provided per Specification Section 26 05 33, sized per the NEC, but no less than 3/4" nominal trade size.

PART 3 - EXECUTION

3.01 All wiring shall be installed in conduit. Conduit shall be run concealed in office areas.

3.02 Install all components per the manufacturer’s specifications and instructions.

3.03 Furnish terminal strips, punch blocks, and connectors for all interconnections.

3.04 Identify all normally operated controls and electronic devices with an engraved plastic nameplate.

3.05 Installation Testing: Set taps and adjust speakers for Architect’s approval. Demonstrate all features of system. Submit a signed Certificate at the end of system testing certifying that all

equipment has been installed in accordance with the manufacturer's requirements and the system is operating properly.

3.06 Guarantee workmanship and/or material executed under this division for one (1) year after final acceptance. During the warranty period, the Owner shall receive repairs and replacement of faulty equipment at no cost for labor, material, or expenses. A repair technician shall respond to Owner calls by arriving at the school within twenty-four hours of any repair request.

3.07 Coordinate work with other trades. Notify the electrical power system contractor of all power requirements for your equipment prior to bid. Include all labor, installation, and equipment costs for additional power system components not shown on the contract drawings, but required by your equipment in your bid. Notify the Engineer of any conflicts at least ten days prior to bid.

3.08 Install work in accordance with the General Contractor's schedule.

Part 4 – CLOSE-OUT DOCUMENTS

4.01 Provide the following documents to the Architect for delivery to the Owner at time of substantial completion:

A. Written guarantee.

B. Two (2) sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, description of operation, shop drawings, wiring diagrams, maintenance procedures and other literature required for maintenance of equipment. The data shall reflect as-built conditions.

4.02 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written instructional material.

4.03 Notify the General Contractor that you are to be present during the system pre-final inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels as required to show the quality of the installation. The system shall demonstrate proper operation and operate without any audible hum, distortion, or erroneous noises. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 27 51 23 - INTERCOM SYSTEM

PART 1 - GENERAL

1.1 Provide a complete and operable Intercom System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 The specification provided is intended to establish a standard of quality – not to limit competition. Equivalent systems of other manufacturers will be acceptable. Gain approval of other manufacturers at least 10 days prior to bid. Acceptance of the manufacturer does not ensure that the actual components submitted after bid will be considered equivalent.

1.4 Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the intercom equipment prior to bid. The Electrical Contractor shall include all costs for powering the intercom equipment in the bid.

1.5 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

PART 2 – PRODUCTS

2.1 Intercom Master Stations: The Intercom System shall be of the open voice selective call type. It shall mount semi-flush and be equipped with door answering, room monitoring, and privacy capabilities. The unit shall be able to place a call to every station in the system. Master Stations shall be able to place calls to Sub-stations and receive calls from the Sub-Stations. Master Units shall sound an audible tone and be equipped with an LED that illuminates upon being called from a Sub-Station or Master. Master Stations shall be Aiphone LEF-10 or approved equal.

2.2 Intercom Sub-Stations: Intercom-Sub Stations shall be surface mounted and weatherproof. They shall be compatible with the Master Stations. Sub-stations shall be equipped with a button that requests communication with the master station. They shall be Aiphone LE-D or approved equal.

2.3 Intercom Power Supply: The power supply shall be capable of supporting Two Master stations and up to three door stations. The unit shall be an Aiphone PC-12C or approved equal.

2.4 Cable: All cables shall be plenum-rated. Verify the following cabling requirements with the vendor prior to bid.:

(1) Cable for the Intercom Power Supply shall be 3-conductor 22 gauge.

(2) Cable for Master Station to Master Station shall be 10-conductor 20 gauge.
(3) Cable from the first Master Station to the Power Supply shall be 3-conductor, 20 gauge.

PART 3 - EXECUTION

3.1 All Intercom System cabling shall be installed in raceways meeting the requirements of Specification 26 05 33 RACEWAYS.

3.2 Each cable passing from outside to inside the building shall be equipped with surge protectors at each end meeting the requirements of the TRANSIENT VOLTAGE SURGE SUPPRESSORS (TVSSs) FOR COMMUNICATIONS AND AUXILIARY SYSTEMS Specification.

3.3 Provide fuses sized per manufacturers' instructions for all system components.

3.4 Test the entire system to ensure that it is completely operable prior to the pre-final inspection. Notify the General Contractor that you are to be present at the pre-final inspection.

3.5 Provide two hours of instruction to the Owner on operation and use of the system.

3.6 Provide a one-year warranty for the system and all components. The warranty shall begin at the date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

SECTION 28 20 00 - INTRUSION DETECTION SYSTEM

PART 1 - GENERAL

1.1 Furnish and install a complete and operable Security System as shown on the drawings and as specified herein.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 Provide all enclosure, hardware, software, devices, circuitry, and other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect and Engineer.

1.4 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

PART 2 - PRODUCTS

2.1 Security System Controller: The Security System Controller shall support up to 9 hardwired zones with a total of 64 zones. It shall support addressable motion detectors and door switches. The controller shall support up to 8 relays or X-10 devices. It shall be connected to the building telephone system and send coded signals to the monitoring agency of the Owner's preference. Pay the monitoring fee from the testing of the system until the General Contractor is granted the Letter of Substantial Completion. The Security System Controller shall be an ADEMCO VISTA-40 or approved equal. **The Security System Controller in the Historic Hospital Building shall operate as a slave to the system in the Police Administration Building.**

2.2 Keypads: Keypads shall have a backlit display that displays system events. They shall make audible "beeps" for entry/exit delays, system status and other alarm conditions. Keypads shall be ADEMCO 6139 or approved equal.

2.3 Motion Detectors: Motion Detectors shall have a 50' x 50', 90 degree coverage and shall detect using passive infrared technology. They shall have both dip switch and serial number addressing. They shall have both horizontal and vertical patterning adjustment. Motion Detectors shall be ADEMCO 998MX or approved equal.

2.4 Glass Break Detectors: Glass Break Detectors shall detect using a dual technology audio and shock glass break detector with a 25' range from the glass. Glass Break Detectors shall be ADEMCO 2500 or equal.

2.5 Door Switches: Door Switches shall be addressable, magnetic contact, recessed type. Door Switches shall be ADEMCO 4191SN or equal.

2.6 Sirens: Sirens mounted indoors shall have an output of 95 Db at 10'. They shall be ADEMCO 747 or approved equal. Sirens mounted in damp locations, such as on the Ground Floor, shall produce 117 dB at 10'. They shall be ADEMCO 702 or approved equal.

2.7 Circuitry: Provide circuitry and cabling as required for optimum system operation, but meeting no less than the following specifications:
(1) Cable for Keypads, Motion Detectors, and Glass Break Detectors shall be 4-conductor, 22 gauge with PVC jacket.
(2) Cable for Door Switches shall be 2-conductor, 20 gauge with PVC jacket.

PART 3 - EXECUTION

3.1 All work shall be done by qualified system technicians.

3.2 Wiring shall be in Raceways meeting Specification 26 05 33.

3.3 Connect to telephone system for complete dialing capability. Employ Owner's designated monitoring agency to monitor system. Consult Owner prior to configuring system.

3.4 Guarantee workmanship and material for a period of one year after final acceptance. During the warranty period, repair or replace faulty equipment at no cost to the Owner for labor, material, or expenses.

3.5 Upon completion of job, test entire system. After testing submit a certificate to Architect stating verification of the following:

PART 4 – CLOSE-OUT DOCUMENTS

4.1 Provide the following documents to the Architect for delivery to the Owner at the time of substantial completion:

A. Written Guarantee
B. Two sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, a description of operation, shop drawings, wiring diagrams, maintenance procedures, and other literature required for operation and maintenance of equipment.

4.2 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written step-by-step instructional material.

4.3 Notify the General Contractor that you are to present during the Pre-final Inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels covers as required to show the quality of the installation. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 28 23 23 - CLOSED CIRCUIT TELEVISION (CCTV) SYSTEM

PART 1 – GENERAL

A. Provide a complete and operable IP Based Closed Circuit Television System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide.

B. Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

C. Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the CCTV equipment prior to bid. The Electrical Contractor shall include all costs for powering the CCTV equipment in the bid.

D. Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

E. Prior to submitting equipment brochures for approval, the successful Electronic Systems Contractor shall completely review the design to ensure that the lens selection is optimum for each application, that all mounting brackets are appropriate for the wall or ceiling on which they will be mounted, and that all cabling is adequate to overcome any voltage drop problems or distance limitations that may occur.

F. The POE switches, Network Attached Storage, and all camera-related networking devices shall be completely operational on a standalone network that is accessible by the Owner's network. Provide the necessary connections to interface the camera network to the Owner-supplied equipment.

G. All components required for the following basic system operation shall be furnished in the quantities required to completely implement the desired mode of operation. Additional components shall be supplied by the Contractor as required to fully implement the system described. All system components shall record and display high definition color images.

    1) A 19 inch monitor connected to the Data Storage System shall be located in the main Telephone Equipment Room in the Police Administration Building. It shall be capable of viewing all images.

    2) **Future Fire Admin: In the future (not in this contract),** two computer systems shall be furnished, installed, and configured for viewing CCTV images. One computer shall be installed at the Reception Desk in Room 116 and at the desk in Office 204.

3) Police Administration and Historic Hospital Building: Four computer systems shall be furnished, installed, and configured for viewing CCTV images. One computer shall be installed at Security A103. The other three computer systems shall be installed in locations specified by the Owner.

4) There shall be no annual charges for any equipment or software licenses for equipment and software furnished on this project. Remote viewing software shall be entirely free of charge.

PART 2 – PRODUCTS

2.1 Video Management Software

The Video Management Software shall be provided with the system free of charge, with no hidden license or update fees. It shall be a MicroSoft Windows based software.

2.2 Cameras

A. Type A Cameras: Type A cameras shall be Mobotix MX-D15Di-Sec-DNight-FIX-D25N25 or approved equal. Provide with corner wall mount MX-MH-Dome where shown wall mounted.

B. Type AW Cameras: Type A cameras shall be Mobotix MX-D15Di-Sec-DNight-FIX-D25N25 or approved equal. Provide with wall mount MX-WH-Dome where shown wall mounted.

C. Type B Cameras: Type B cameras shall be Mobotix MX-Q24M-Sec-D11 or approved equal.

D. Type C Cameras: Type C cameras shall be Mobotix MX-M24M-Sec-N22 or approved equal. Provide with pole mount MX-MH-SecureFlex-ESWS where shown pole mounted.

E. Type D Cameras: Type D cameras shall be Mobotix 6MP-P25 with B041 Super Wide lense.

F. Type V Cameras: Type V cameras shall be Mobotix V15M-Sec-DNight-D22N22-6MP-F1.8 in Detention-Grade Vandal Resistant housings.

2.3 POE Switches: The camera POE switches shall be HP ProCurve Switch 2510 Series or approved equal. A POE switch shall be mounted in the Telecommunications Equipment Rack in the Telephone Equipment Room.

2.4 Data Storage System: Provide a complete system of equipment for data storage and viewing for all camera images. All images shall be recorded continuously. Provide the network attached storage (NAS), transmitters, receivers, cabling, software, installation and all other equipment required for a complete and operable system. The NAS shall be a QNAP TS-469U-SP with 6 TB of hard drive storage included or approved equal.

2.5 Equipment Mounting: Mount the equipment in the Telecommunications Equipment Rack furnished under Section 27 30 00. The NAS and switches in the Telephone Equipment Room shall be mounted in the rack.

2.6 Computer Systems: The computer systems shall meet the following specifications:

A. Central Processing Unit (CPU): The personal computer system CPU shall be dual core @ 2.4 GHz (Core Duo Intel processor or equivalent AMD). The system shall have at least 4 gigabytes of RAM and be equipped with at least a 250 gigabyte hard drive. The unit shall be furnished with a CD-RW drive and a DVD-RW drive. The CPU shall be equipped with at least two communications ports along with all other necessary hardware and software to support all components of the system. The system shall have a parallel port, a serial port, no less than three USB ports, and a 10/100/1000 Mbps (Gigabit) Ethernet port. The system shall have a graphics card with 512 megabytes video memory or higher and DVI/HDMI ports compatible with the provided monitor. The CPU, monitor, keyboard, and entire system shall be manufactured by Hewlett Packard, Dell, Toshiba, or Sony.

B. Monitor: The monitor shall be at least a 21" Flat Screen.

C. Keyboard: The keyboard shall be a standard QWERTY keyboard with numeric keypad on the right side.

D. Mouse: The mouse shall be a Microsoft or Logitech three-button mouse. Track balls will not be accepted.

E. Software: The computer shall be furnished with the vendor's latest Windows-based software installed.

2.7 Monitor: The 19" multiplex monitor connected to the DAS shall be Pelco PMCL419HB or approved equal.

2.8 Circuitry: Provide all circuitry necessary for optimum performance of system components. Minimum requirements are provided as follows. Increase conductor sizes and modify cable types as required to compensate for voltage drop or other system or site conditions.

A. Video Signal Cable: All CCTV video cabling shall be Category 6 rated UTP, outdoor-rated cable installed in conduit.

B. Fiber Optic Cabling: Cameras at distances exceeding the limitations of Category 6 cable shall be fed with four strand, single mode fiber optic cable. Media converters shall be provided at the nearest POE switch and at the camera. Coordinate remote camera locations with the Electrical Contractor to ensure that he provides 120V power in those locations.

C. Power Cable: Coordinate remote camera locations with the Electrical Contractor to ensure that he provides 120V power in the locations where fiber optic to POE media converters are provided. Power cable shall be #12 AWG unshielded cable with PVC jacket. It shall be West Penn #227 or approved equal. Increase conductor sizes as required to accommodate voltage drop. The Owner shall not be responsible for additional 120V power as required to accommodate additional media converters.

PART 3 – EXECUTION

3.1 All CCTV cabling shall be installed in raceways meeting the requirements of the RACEWAYS specification.

3.2 Surge Protective Devices shall be installed on all cables where they leave and where they enter any building.

3.3 Test the entire system to ensure that it is completely operable prior to the pre-final inspection. Notify the General Contractor that you are to be present at the pre-final inspection.

3.4 Schedule a training session with the Owner through the General Contractor at the Owner's convenience. The training session shall be scheduled to occur after the Owner's switches have been installed and the Owner's computer network has been made operable. The installation and configuration of remote viewing of CCTV images shall be demonstrated with the completed CCTV system provided in this contract. Begin scheduling this training at least one month prior to substantial completion. Provide four hours of instruction to the Owner on operation and use of the system. Video the training session and provide a DVD of the training session to the Owner with the close-out documents. The training session shall not be conducted until all system components have been tested and verified to be operating properly.

3.5 Provide a one-year warranty for the system and all components and a five-year warranty on all fixed cameras. The warranty shall begin at the date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

SECTION 28 30 00 - ACCESS CONTROL SYSTEM

PART 1 - GENERAL

1.1 Provide a complete and operable Door Locking Control System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 The specification provided is intended to establish a standard of quality – not to limit competition. Equivalent systems of other manufacturers will be acceptable.

1.4 Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Owner and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the Door Locking Control System equipment prior to bid. The Electrical Contractor shall include all costs for powering the Door Locking Control System equipment in the bid.

1.5 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

PART 2 – PRODUCTS

2.1 Card Reader Controller: The controller shall be capable of controlling access to the doors shown on the drawings plus at least four more.

2.2 Personal Computer System: Provide a complete personal computer system with all hardware and software as required to program the proximity cards as well as to program and operate the locking control system. Provide all cables necessary for complete operation of the computer and peripherals. Minimum requirements for system components are provided as follows:

A. Central Processing Unit (CPU): The personal computer system CPU shall be dual core @ 2.4 GHz (Core Duo Intel processor or equivalent AMD). The system shall have at least 4 gigabytes of RAM and be equipped with at least a 250 gigabyte hard drive. The unit shall be furnished with a CD-RW drive and a DVD-RW drive. The CPU shall be equipped with at least two communications ports along with all other necessary hardware and software to support all components of the system. The system shall have a parallel port, a serial port, no less than three USB ports, and a 10/100/1000 Mbps (Gigabit) Ethernet port. The system shall have a graphics card with 512 megabytes video memory or higher and DVI/HDMI ports compatible with the provided monitor. The CPU, monitor, keyboard, and entire system shall be manufactured by Hewlett Packard, Dell, Toshiba, or Sony.

B. Monitor: The monitor shall be at least a 21" Flat Screen.

C. Keyboard: The keyboard shall be a standard QWERTY keyboard with numeric keypad on the

right side.

D. Mouse: The mouse shall be a Microsoft or Logitech three-button mouse. Track balls will not be accepted.

E. Software: The computer shall be furnished with the vendor's latest Windows-based software installed.

2.3 Power Supplies: The Power Supplies shall provide power to the Card Access Control Panel and the door locks and shall be provided with batteries for up to 24 hour operation in the event of a power outage.

2.4 Card Readers: Card readers shall be proximity type readers. They shall be suitable for indoor and outdoor use.

2.5 Biometric Readers: Biometric readers shall be a fingerprint type reader.

2.6 Cards: Furnish 200 proximity photoID cards for the Owner's use.

2.7 Provide camera and all equipment necessary for producing and installing color photographs on the cards. Provide supplies for 200 proximity cards.

2.8 Magnetic Locks: The magnetic door locks shall be rated for 1500 pounds holding force. Provide all brackets necessary for mounting on doors where magnetic locks are shown. Provide strikes on doors as required.

2.9 Motion Detectors: Provide passive infrared (PIR) motion detectors as required per NFPA 101.

2.10 Exit Pushbuttons with Timers: Each exit pushbutton shall be provided in a stainless steel wallplate on a flush-mounted single gang outlet box. They shall be of the double-pole, double-throw type and configurable with momentary or latching contact status. They shall operate within a temperature range of 32 degrees F to 158 degrees F.

2.11 Suppressor Kits: Provide two suppressor kits for each relay output. Install one suppressor kit at the Card Access Control Panel and one suppressor kit at the magnetic door lock.

2.12 Circuitry: Provide circuitry as required for optimum system performance, but meeting the following minimum requirements.

PART 3 - EXECUTION

3.1 All Door Lock Control System cabling shall be installed in raceways meeting the requirements of Specification 26 05 33 RACEWAYS.

3.2 Each cable passing from outside to inside the building shall be equipped with surge protectors at each end meeting the requirements of the manufacturer's specifications.

3.3 Provide fuses sized per manufacturers' instructions for all system components.

3.4 Test the entire system to ensure that it is completely operable prior to the pre-final inspection. Notify the General Contractor that you are to be present at the pre-final inspection.

3.5 Provide eight hours of instruction to the Owner on operation, maintenance, and modification of the system.

3.6 Provide a one-year warranty for the system and all components. The warranty shall begin at the

date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

SECTION 28 31 00 - FIRE ALARM SYSTEM

PART 1 – GENERAL

1.1 GENERAL

A. Furnish and install a complete and operable fire alarm system in accordance with the Contract drawings and all federal, state, and local codes. Equipment on the drawings represents the absolute minimum required for the project. Include costs for all other required devices and equipment required for a complete and operable code compliant system. Notify the engineer in writing of any devices required by code, but not shown, at least ten days prior to bid.

B. Comply completely with the latest edition of all applicable federal, state, and local codes including, but not limited to the following:

1) National Electrical Code (NFPA 70)
2) Life Safety Code (NFPA 101)
3) National Fire Alarm Code (NFPA 72)
4) The International Building Code
5) ANSI/ASME A17.1, Safety Code for Elevators and Escalators

1.2 SCOPE OF WORK

A. Provide all enclosures, hardware, software, devices, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Engineer and all authorities.

B. All components of the system shall be manufactured by the same company. The system and its components shall be approved by UL and Factory Mutual.

C. All system components shall be installed by a franchised distributor of the fire alarm system having a repair and service department on call 24 hours a day, seven days a week. The repair and service department shall be located within 150 miles of the project.

D. Submit complete shop drawings showing all devices including mounting locations and heights and terminal-to-terminal connections. **Employ an independent third party testing agency that will be involved in certification of the system to review the shop drawings to ensure compliance with the contract documents and all applicable codes.**

PART 2 – PRODUCTS

2.1 Provide an intelligent, addressable fire alarm control panel complete with all equipment necessary to monitor and control the devices shown. **Note: The Historic Hospital Building is shown with a separate fire alarm control panel; however, it is preferred that this panel be a slave panel of the Fire Alarm Control Panel in the Police Administration Building.** The system shall sound a non-coded general alarm. Upon an alarm condition, the fire alarm control panel shall automatically report the alarm condition to a monitoring agency. Provide all telephone connections, circuitry, and conduit to perform this functionality back to the telephone backboard.

2.2 Provide an integral smoke evacuation system with all equipment necessary to supervise, activate, and monitor the smoke evacuation fans and system components. Provide a remote activation control panel at the main entrance for use by authorized personnel for the activation and monitoring of the smoke evacuation system.

2.3 Provide a NiCad battery sized to operate the control panel without normal power for 24 hours, and then to alarm the panel continuously for at least five minutes (or as required by codes). Submit battery sizing calculations with the manufacturer's cut sheets and shop drawings.

2.4 All devices shall be addressable and shall be electrically supervised.

2.5 Smoke detectors shall be of the photoelectric type.

2.6 Duct detectors shall be of the air sampling type. Furnish complete with sampling tubes and duct housings.

2.7 Smoke detectors mounted under raised computer floors shall be of the photoelectric type. They shall be UL listed for installation in plenums.

2.8 Pull stations shall be of metallic construction. They shall be furnished with lexan shields and warning horns.

2.9 Horns shall be rated a minimum of 85 dB at 10'.

2.10 Speakers shall be square. They shall be wall-mounted to a 4" square box. They shall produce a minimum sound level of 85dB at 10'. They shall have adjustable taps for volume level adjustment.

2.11 Strobes shall have a nominal rating of at least 75 Cd.

2.12 Combination horn-strobe units or speaker-strobe units shall meet the specified requirements of the individual horns, strobes, and speakers.

2.13 Monitor all sprinkler system flow switches at the facility. Provide an alarm upon flow indication.

2.14 Monitor all sprinkler system tamper and supervisory switches at the facility. Provide a trouble signal upon tamper indication.

2.15 Provide duct detectors in the return duct of all air units. If a fresh air intake duct is installed, all duct detectors shall be mounted upstream of the intake duct. For air units with flow ratings greater than 15,000 CFM, provide duct detectors in both the return and supply ducts.

2.16 Provide all necessary relays and circuitry, and shut down all air units upon an alarm condition of the fire alarm system.

2.17 **Police Administration Building Only:** Provide a Fireman's Smoke Evacuation System Control Panel. In automatic mode, the Smoke Evacuation Fans shall operate and the motorized damper on LVR-3 shall actuate upon an alarm condition of a smoke detector in the atrium or an alarm condition caused by a sprinkler flow switch serving the atrium. Also, the eight smoke dampers on the perimeter of the atrium shall actuate. The Fireman's Smoke Evacuation System Control Panel shall permit the firemen to override any and all automatic controls of the smoke evacuation fans or the motorized damper on LVR-3.

2.18 Provide all necessary equipment and circuitry for control of the elevator in accordance with ANSI/ASME A17.1, Safety Code for Elevators and Escalators.

2.19 Provide all necessary equipment and circuitry to automatically release the magnetic door locks upon an alarm of the Fire Alarm System **except those in areas where inmates are detained**.

2.20 Conductors shall be #14 AWG copper rated THHN/THWN. Provide larger conductors where required to compensate for voltage drop.

2.21 Provide all necessary equipment and circuitry to monitor and activate the smoke evacuation system.

2.22 Provide all necessary equipment to activate smoke evacuation fans.

PART 3 – EXECUTION

3.1 All components and circuitry shall be assembled and installed per the requirements of all applicable codes and the manufacturer's recommendations.

3.2 All devices shall be mounted with their boxes flush in the walls.

3.3 Smoke detectors shall be mounted at least 36" away from supply and return vents.

3.4 All outlet boxes, junction boxes, and cover plates shall be painted red.

3.5 All circuitry shall be in concealed conduit sized per the NEC, but no less than 3/4" EMT. All fire alarm conduits shall be painted red.

3.6 The Fire Alarm System Contractor shall employ an independent third party testing agency to test and certify all system components, including each smoke detector, duct detector, pull station, and the smoke evacuation system prior to the pre-final inspection. All systems shall be completely operable prior to the request for a pre-final site observation. The system shall be tested in the presence of the Owner, Architect, and Engineer at the prefinal site observation.

3.7 Provide a one-year warranty for the system and all components. The warranty shall begin at the date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

SECTION 31 05 00

TEMPORARY SILT FENCE

PART 1 GENERAL

1.01 STANDARD SPECIFICATION REFERENCE

Section 234 of the 1990 *Mississippi Standard Specifications for Road and Bridge Construction* and referenced sections is hereby referenced and amended as follows:

END OF SECTION

SECTION 31 11 00

SITE PREPARATION

PART I GENERAL

1.01 SCOPE

A. To be determined from the Contract Documents and an examination of the site. Include preparation for the work and protection of existing improvements and adjoining property and vegetation.

1.02 LAYOUT OF THE WORK

A. Accurately lay out the entire work. If interferences or problems arise, request instructions before proceeding. If it appears, in the professional opinion of the Contractor, that vegetation is in jeopardy and best to be removed prior to the beginning of construction, it should be reviewed on the site with the Architect for approval.

1.03 OWNER PROVIDED DOCUMENTS

A. The following are hereby designated as Contract Documents whether bound in with the other documents or separate. The inclusion with the Architect's documents is for convenience. The Architect does not guarantee their content as to accuracy, completeness, or suitability. These documents shall be the basis on the Contract for existing surface conditions.

B. Survey: As shown on S1 and prepared by Clearpoint Engineers.

C. Soil Borings provided by Burns Cooley Dennis, dated May 2012.

PART II EXECUTION

2.01 CLEARING

A. Removal: Remove trees, shrubs, grass, and other vegetation, improvements, or obstructions as indicated which interfere with new construction. Removal includes digging out stumps and roots.

B. Protection: Provide temporary fences, barricades, coverings, or other protection to preserve existing items indicated to remain and to prevent injury or damage to persons or properties as required. Temporary fences must be 6' high chain link with no top rail.

C. Traffic: Conduct site clearing operations to ensure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities. Obtain permission from authorities having jurisdiction.

D. Protect Existing Trees & Vegetation: Protect all existing vegetation from physical damage. Do not store materials or equipment within tree drippings. Any trees which are shown to remain, but are destroyed, will be compensated for by the Contractor at the rate required for comparable replacement.

E. Air Pollution: Control air pollution caused by dust and dirt; comply with governing regulations.

2.02 DAMAGED WORK

A. Restore damaged work to condition existing prior to start of work, unless otherwise directed at Contractor's expense.

2.03 TOPSOIL

A. Strip and remove all topsoil and dirt from site.

2.04 FILLING AND GRADING

A. Fill below the grade areas and void resulting from demolition operations. Use satisfactory soil materials, placed in 6" deep horizontal layers with each layer thoroughly compacted.

B. Grade ground surface to conform to required contours and to provide surface drainage. A positive slope is to be provided away from the building at all locations. Minimum slopes shall be 1% at any location to prevent puddles.

END OF SECTION

SECTION 31 22 19

TOPSOIL

PART I GENERAL

1.01 STANDARD SPECIFICATION REFERENCE

A. Section 211 of the 1990 Mississippi Standard Specification for Road and Bridge Construction and referenced sections is hereby referenced and made a part of these specifications.

END OF SECTION

SECTION 312319: EARTHWORK FOR STRUCTURES-POLICE/COURT BUILDING

PART 1 GENERAL

1.1 RELATED SECTIONS

A. Division 1 Sections

1.2 REFERENCES

ASTM D422 – Standard Test Method for Particle-Size Analysis of Soils.

ASTM D698 – Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3).

ASTM D1556 – Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method.

ASTM D3017 – Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).

ASTM D4318 – Standard Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.

1.3 DEFINITIONS

A. Granular Subbase: Fill directly beneath slabs-on-grade.

B. Backfill: Fill immediately behind foundation elements or retaining walls.

C. Structural Fill: Fill under the structure other than the granular subbase.

1.4 SUBMITTALS

A. Upon request, submit soil test reports performed by the Structural Testing/Inspection Agency.

1.5 QUALITY ASSURANCE

A. Refer to the Structural Quality Assurance Plan in the Structural Drawings.

1.6 SURVEY

A. Prior to construction, have structure location staked and certified by a licensed surveyor. If discrepancies between actual lines and elevations exist, notify Architect/Structural Engineer before proceeding with layout of structure.

1.7 SUBSURFACE CONDITIONS

A. Copies of a subsurface investigation of the site will be made available upon request. The data is not intended as a representation or warranty of the continuity of such conditions. Owner will not be responsible for interpretation or conclusions drawn by the Contractor. The data is made available for the convenience of the Contractor and is not guaranteed to represent all conditions that may be encountered.

B. Contractor may examine the site and make his own subsurface explorations at no additional cost to the Owner. Notify Owner prior to making any subsurface explorations.

1.8 EXISTING UTILITIES

A. Locate existing underground utilities by careful hand excavation. If utilities are to remain in place, provide protection from damage during construction operations.

B. Cooperate with Owner and utility companies in keeping respective services and facilities in operation. Do not interrupt existing utility service facilities occupied and used by Owner or others, unless written permission is given by the Architect and then only after temporary utility services have been provided.

C. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, consult the Architect immediately for directions.

D. Repair damaged utilities to satisfaction of utility owner.

1.9 NOTICE

A. Notify the Architect/Structural Engineer 48 hours prior to the beginning of any excavation work.

PART 2 PRODUCTS

2.1 GRANULAR SUBBASE

A. Granular Subbase: Sound and free-draining, such as sand, gravel or crushed stone with less than 10% passing the 200 sieve. Maximum diameter shall be 1-1/2 inches.

2.2 BACKFILL

A. Backfill: Sound and free-draining, such as sand, gravel or crushed stone with less than 10% passing the 200 sieve. Maximum diameter shall be 1-1/2 inches.

2.3 STRUCTURAL FILL

A. Structural Fill: Clayey Sands with a plasticity index of 6 to 25, Lean clay with a plasticity index of 10 to 25. On site soils with a plasticity index of 10 to 25. Delineation of fat clays and lean clays of onsite soils should be performed in the field by a qualified geotechnical engineer or their representative, and could require additional laboratory resting. All structural fill shall have a Liquid limit less than 45.

B. Structural Fill shall be free of organics, debris and deleterious materials.

PART 3 EXECUTION

3.1 STRIPPING

A. Strip vegetation, topsoil, roots, and other unsuitable material to a depth determined by the Structural Testing/Inspection Agency but not less than one foot, nor less than 10 feet outside the perimeter of the structure.

B. Stockpile sufficient amounts of topsoil as required to cover areas to be landscaped with a minimum of six inches of material.

3.2 EXCAVATION

A. Excavation shall be considered unclassified. Excavations shall comply with U.S. Department of Labor, Occupation Safety and Health Administration (OSHA) regulations.

B. Perform excavation to the depths and limits on the Drawings and as specified herein.

C. Do not excavate to full depth when there is probability of frost forming or ground freezing in excavation before concrete is placed.

D. Ground water may be encountered during the foundation excavation. Provide a system for controlling the ground water to a level at least three feet below the lowest point of the excavation.

E. Keep excavations dry by sloping ground away from holes and trenches.

3.3 PROOFROLLING

A. After stripping or excavation and before any fill placement, fill areas shall be proofrolled with a minimum of two coverages of a loaded dump truck or scraper in each of two perpendicular directions.

B. Areas found to be soft or pumping shall have the soft soil removed and replaced with structural fill and compacted as outlined herein.

3.4 PLACEMENT OF STRUCTURAL FILL

A. Do not place structural fill on subgrade that contains frost, mud or is frozen.

B. Structural fill shall be placed and compacted in 6 to 9-inch thick loose layers.

C. Compact structural fill to 98 percent of the maximum dry density as measured by Standard Proctor, ASTM D698, with water content within +2/-2 percent of the optimum moisture content.

3.5 PLACEMENT OF BACKFILL

A. Backfill behind wall shall be placed in layers of 4 to 6- inches.

B. Compact backfill behind walls to 98 percent of the maximum dry density as measured by Standard Proctor, ASTM D698, with water content within +2/-2 percent of the optimum moisture content.

3.6 PLACEMENT OF GRANULAR SUBBASE

A. Do not place granular subbase on subgrade that contains frost, mud or is frozen.

B. Compact backfill behind walls to 95 percent of the maximum dry density as measured by Standard Proctor, ASTM D698, with water content within +2/-2 percent of the optimum moisture content.

3.7 CLEAN UP

A. Remove excess excavated materials from job site and upon completion leave site in clean condition.

END OF SECTION

SECTION 31 31 16

TERMITE CONTROL

PART I GENERAL

1.01 SCOPE

A. Provide soil treatment for termite control as herein specified.

B. Engage a bureau of Plant Industry licensed professional pest control operator for application of soil treatment solution.

1.02 WARRANTY

A. Furnish written contract guaranteeing property will be treated with a soil termiticide in compliance with Bureau of plant industry rules and regulations and, that if subterranean termite activity is discovered during warranty period, Contractor will re-treat soil and repair and/or replace damage caused by termite infestation.

B. Provide warranty for a period of five years from date of treatment, signed by Applicator and Contractor.

PART II PRODUCTS

2.01 SUBMITTAL

A. Protect area with a proper by-the-label application of any termiticide by the U.S. Environmental Protection Agency (EPA) and the Bureau of Plant Industry.

B. Protect existing structures with a complete proper by-the-label application under and around application of any termiticide registered by the U.S. EPA and the Bureau of Plant Industry.

C. Other solutions may be used as recommended by Applicator and if acceptable to the Bureau of Plant Industry and to Architect. Use only soil treatment solutions which are not injurious to planting.

PART III EXECUTION

3.01 APPLICATION

A. Do not apply soil treatment solution until excavating, filling and grading operations are completed, except as otherwise required in construction operations.

B. To insure penetration, do not apply treatment to frozen or excessively wet soils or during inclement weather. Comply with handling and application instructions of soil toxicant manufacturer.

C. Remove foreign matter which could decrease effectiveness of treatment on areas to be treated. Loosen, rake, and level soil to be treated, except previously compacted areas under slabs and foundations. Toxicants shall be applied before placement of fill under slabs, if recommended by toxicant manufacturer.

D. Apply soil treatment solution at rates recommended by soil toxicant manufacturer.

E. Allow not less than 12 hours for drying after application before beginning concrete placement or other construction activities.

F. Post signs in areas of application warning workers that soil poisoning has been applied. Remove signs when areas are covered by construction.

G. Reapply soil treatment solution to areas disturbed by subsequent excavation or other construction activities following application.

END OF SECTION

SECTION 313421: AGGREGATE PIER SOIL REINFORCEMENT

PART 1 GENERAL

1.1 DESCRIPTION

A. Work shall consist of designing, furnishing and installing aggregate pier elements to the lines and grades designated on the project foundation plan and as specified herein. Aggregate piers shall be provided to reinforce the existing soils for support of shallow foundations as indicated in the Structural Drawings. The aggregate pier elements shall be constructed using vibratory methods, such as a down-hole vibratory probe, or by compacting aggregate in an excavated hole using special high-energy impact densification equipment.

1.2 AGGREGATE PIER INSTALLATION

A. Provide all equipment, casing, material, labor, and supervision to design and install aggregate pier elements.

B. Perform two (2) Modulus Tests.

1.3 RELATED SECTIONS

A. Section 312318 – Earthwork for Structures

B. Section 033000 – Cast-In-Place Concrete

1.4 REFERENCE STANDARDS

ASTM STP 399 – Dynamic Penetrometer Testing.

ASTM D422 – Standard Test Method for Particle-Size Analysis of Soils.

ASTM D1143 – Standard Test Method for Piles Under Static Axial Compressive Load.

ASTM D1194 – Full-Scale Load Testing (Individual Column or Column Groups) Modified for Size.

ASTM D1586 – Standard Test Method for Penetration Test and Split-Barrel Sampling of Soils.

ASTM D3689 – Standard Test Method for Individual Piles Under Static Axial Tension Load.

ASTM D5778 – Cone Penetrometer Testing (CPT)

1.5 SUBSURFACE CONDITIONS

A. Copies of a subsurface investigation of the site will be made available upon request. The data is not intended as a representation or warranty of the continuity of such conditions. Owner will not be responsible for interpretation or conclusions drawn by the Contractor. The data is made available for the convenience of the Contractor and is not guaranteed to represent all conditions that may be encountered.

B. Contractor may examine the site and make his own subsurface explorations at no additional cost to the Owner. Notify Owner prior to making any subsurface explorations.

1.6 EXISTING UTILITIES

A. Contractor shall be responsible for locating and protecting all existing underground utilities and other structures during the installation of the Aggregate Piers. If utilities are to remain in place, provide protection from damage during construction operations.

B. Cooperate with Owner and utility companies in keeping their respective services and facilities in operation. Do not interrupt existing utility service facilities occupied and used by Owner or others, unless written permission is given by the Architect and then only after temporary utility services have been provided.

C. Should uncharted or incorrectly charted piping or other utilities be encountered, consult Architect immediately for directions.

D. Repair damaged utilities to satisfaction of utility owner.

1.7 CONFLICTS IN SPECIFICATIONS/REFERENCES

A. Where specifications and reference documents conflict, the Architect/Structural Engineer shall make the final determination of the applicable document.

1.8 SUBMITTALS AND CERTIFICATIONS

A. Aggregate Pier Contractor shall submit a list of at least five previously completed projects of similar size and scope for review by the Architect/Structural Engineer. The list shall include a description of the project, relative size, and contact person with phone number.

B. Aggregate Pier Contractor shall submit the following to the Architect/Structural Engineer a minimum of three weeks before the start of construction:
   1. Resumes of key management and supervisory personnel.
   2. Detailed design calculations and construction drawings prepared by the Aggregate Pier Engineer. All drawings and calculations shall be sealed by a Professional Engineer in the State in which the project is constructed. Drawings shall clearly indicate the spacing, location, and depth of aggregate piers required to achieve the performance criteria outlined in this specification.
   3. A ground improvement Quality Assurance plan as outlined in section 1.10 of this specification.
   4. Work procedures and control criteria.
   5. Load test detail and setup that confirms the modulus of the aggregate piers used in the design.
   6. A schedule of work tasks and time for completion.

C. Upon completion of the aggregate pier installation, the Aggregate Pier Contractor should submit a letter certifying the aggregate pies have been installed in general conformance with the approved aggregate pier submittal and the soils have been improved for allowable bearing pressures as stated in the contract documents.

1.9 QUALITY ASSURANCE

A. The design and installation of Aggregate Piers shall be performed by a specialty Aggregate Pier Contractor with a minimum of five continuous years of documented experience with the installation of Aggregate Piers and shall have completed at least 50 projects.

B. Aggregate Pier Contractor shall provide experienced management, supervisory and key personnel as required to implement and complete the installation of the Aggregate Piers as indicated on the Approved Aggregate Pier Submittal. The Project Manager shall have at least two years of continuous experience

with Aggregate Piers, with at least the last year in full-time employment of the Aggregate Pier Contractor. The superintendent shall have at least two years of experience with Aggregate Piers.

C. Aggregate Pier Contractor shall have a full-time quality control representative to verify and report all quality control installation procedures. Complete and accurate daily records of aggregate pier installation shall be submitted to the Contractor and the Special Inspector. The records shall include the following:
1. Footing and Aggregate Pier location or number.
2. Aggregate Pier length and drilled diameter.
3. Start and finish time of the Pier installation.
4. Planned and actual Aggregate Pier elevations at the top and bottom of the element.
5. Average lift thickness (where appropriate) for each Pier.
6. Backfill quantities for each Pier.
7. Soil types encountered at the bottom of each Pier and along the length of the element.
8. Depth to groundwater, if encountered.
9. Type and size of densification equipment used.
10. Any unusual conditions encountered.

Aggregate Pier Contractor shall immediately report any unusual conditions encountered during installation to the Contractor, Structural Engineer, and to Special Inspector.

D. Aggregate Pier Contractor shall submit any changes to the approved Aggregate Pier design, necessitated by a change in the subsurface conditions, to the General Contractor, the Architect/Structural Engineer and the Special Inspector.

E. Perform Modulus Tests. Refer to Paragraph 1.2.B for number of tests required.

F. Aggregate Pier Contractor shall submit a report documenting observations and results of the Modulus Test(s) to the Contractor and the Architect/Structural Engineer. Report shall certify that the design bearing pressure was achieved within the specified settlement tolerances and shall include a description of the installation equipment, installation records, complete test data, analysis of the test data and recommended design parameter values based on the modulus test results. Report shall be prepared under supervision of a registered professional engineer.

G. Refer to the Structural Quality Assurance Plan in the Structural Drawings for specific responsibilities of the Contractor and the Special Inspector.

1.10 BASIS OF PAYMENT

A. The preparation of construction drawings and specifications, installation of Aggregate Piers including casing as required, and performance of Modulus Tests shall be included in a lump sum bid. Refer to Paragraph 1.2.B for the number of Modulus Tests required.

B. Unit prices shall be provided for the following:
1. Additional Aggregate Piers.
2. Additional Mobilizations.
3. Additional Modulus Tests.

PART 2 PRODUCTS

2.1 BACKFILL MATERIALS

A. Backfill aggregate shall consist of hard, angular to sub-angular durable rock fragments with the majority of the particles in the range of 1/8 inch to 1-1/2 inches such as ASTM D448, size No. 67. The aggregate

shall be identical to that used for the successful modulus test. The Special Inspector shall approve the backfill aggregate.

2.2 EQUIPMENT

A. Down-hole Vibratory Probe: The vibratory probe shall be capable of producing horizontal vibrations from an energy source near the tip of the probe. Aggregate Pier Contractor shall use an electric probe capable of providing at least 80 HP of rated energy and a centrifugal force of 15 tons. An appropriate metering device shall be provided at such location that inspection of amperage increase may be verified during operation of the equipment. The metering device may be an ammeter directly indicating the performance of the probe tip.

B. Tamper: The tamper shall have a diameter that is at least 70 percent of the predrilled hole diameter, have beveled sides, and be long enough to reach the full depth of the predrilled hole. The energy shall be from a minimum 3,500 lb. class impact hammer.

PART 3 EXECUTION

3.1 AGGREGATE PIER PERFORMANCE CRITERIA

A. Aggregate Pier stiffness modulus value used for design shall be verified by the results of the Aggregate Pier modulus tests, described in this specification.

B. Aggregate Piers shall be designed in accordance with generally-accepted engineering practice and as required by these Specifications. The design shall meet the following criteria.

Minimum Allowable Bearing Pressure for Aggregate Pier Reinforced Soils:	See Sheet S0.1
Estimated Total Long-Term Settlement for Footings:	≤1-inch
31 Estimated Long-Term Differential Settlement of Adjacent Footings:	≤ ½-inch

C. The design submitted by the Aggregate Pier Contractor shall consider the bearing capacity and settlement of all footings supported by aggregate piers, and shall be in accordance with acceptable engineering practice and these specifications. Total and differential settlement shall be considered. The design life of the structure shall be 50 years.

D. Aggregate Pier system shall be designed to preclude plastic bulging deformations at the top-of–pier design stress and to preclude significant tip stresses as determined from the shape of the telltale test curve from telltales installed in modulus test piers.

3.2 PIER TOLERANCES

A. The center of each Aggregate Pier shall be within six inches of the plan locations indicated. The final measurement of the top of piers shall be the lowest point on the aggregate in the last compacted lift. Piers installed outside of the above tolerances and deemed not acceptable shall be rebuilt at no additional expense to the Owner.

3.3 REJECTED AGGREGATE PIERS

A. Aggregate Piers improperly located or installed beyond the maximum allowable tolerances shall be abandoned and replaced with new piers, unless the Designer approves other remedial measures. All material and labor required to replace rejected piers shall be provided at no additional cost to the Owner.

3.4 MODULUS TEST

A. Modulus test shall be performed by the Aggregate Pier Contractor to verify the parameter values selected for design. The modulus test shall be of the type and installed in a manner specified herein. Refer to Paragraph 1.2.B for the number of tests required.

B. Aggregate Pier Contractor shall provide and install all dial indicators and other measuring devices as required to perform the tests.

C. At the option of the Aggregate Pier Contractor, a telltale may be installed at the bottom of the test pier so that bottom-of-pier deflections may be determined. Acceptable performance is indicated when the bottom of the pier deflection is no more than 20% of the top of pier deflection at the design stress level.

D. ASTM D-1143 general test procedures shall be used as a guide to establishing load increments, load increment duration, and load decrements.

E. Hold-time for load increments (except as noted in paragraph E.) shall be a minimum of 15 minutes. The maximum hold-time shall not exceed 1 hour. Loads shall be held until the deflection rate has decreased to a maximum of 0.01 inch per hour, or less.

F. The load increment that represents approximately 115% of the design maximum stress on the Aggregate Pier shall be held for a minimum of 15 minutes. The maximum hold-time shall be 4 hours. The load shall be held until the deflection rate has decreased to a maximum of 0.01 inch per hour, or less.

G. A seating load equal to 5 percent of the total load shall be applied to the loaded steel plate prior to application of load increments and prior to measurement of deflections to compensate for surficial disturbance.

H. Aggregate Pier modulus testing shall be performed in accordance with the requirements outlined in the Design Submittal.

I. Locations of the Aggregate Pier modulus tests should be coordinated with the Structural Testing/Inspection Agency and the Architect/Structural Engineer.

3.5 PROTECTION OF THE WORK

A. Upon completion of the Aggregate Pier installation, the General Contractor shall be responsible for protection of the work. This includes, but is not limited to, proper site drainage to prevent the collection or ponding of water on or near completed Aggregate Piers and appropriate control and coordination of earthwork activities and/or subsequent drilling activities in order to prevent damage to completed rammed aggregate piers.

3.6 EXCAVATIONS

A. Contractor shall coordinate all excavations made subsequent to Aggregate Pier installations so that at least five feet of horizontal distance remains between the edge of any installed Aggregate Pier and the excavation. Protection of completed Aggregate Pier elements is the responsibility of the Contractor. In the event that utility excavations are required at horizontal distances of less than five feet from installed Aggregate Piers, the Contractor shall contact the Aggregate Pier Engineer to develop construction solutions to minimize impacts on the installed Aggregate Piers.

3.7 FOOTING SUBGRADE PREPARATION

A. Excavation and surface compaction of all footings shall be the responsibility of the Contractor.

B. Foundation excavations to expose the tops of Aggregate Pier elements shall be made in a workmanlike manner, and shall be protected until concrete placement, with procedures and equipment best suited to (1) prevent softening of the matrix soil between and around the Aggregate Pier elements before pouring structural concrete, and (2) achieving direct and firm contact between the dense, undisturbed Aggregate Pier elements and the concrete footing.

C. The following procedures shall be followed during subgrade preparation:
   1. Limit over-excavation below the bottom of the footing to 3-inches (including disturbance from the teeth of the excavation equipment).
   2. Compaction of surface soil and top of Aggregate Pier elements shall be prepared using a motorized impact compactor (“Wacker Packer,” “Jumping Jack,” or similar). Sled-type tamping devices shall not be used. Compaction shall be performed over the entire footing bottom to compact any loose surface soil and loose surface pier aggregate.
   3. Place footing concrete immediately after footing excavation is made and approved, preferably the same day as the excavation. Footing concrete must be placed on the same day if the footing is bearing on expansive or sensitive soils.
   4. If same day placement of footing concrete is not possible, place a minimum 3-inch thick lean concrete seal (‘mud mat”) immediately after the footing is excavated and approved.

D. The following foundation construction criteria shall be strictly adhered to:
   1. Water shall not be allowed to pond in the footing excavation at any time.
   2. The top of all Aggregate Pier elements within each footing shall be exposed in the footing excavation.
   3. Immediately prior to footing construction, the tops of all the Aggregate Pier elements exposed in each footing excavation shall be inspected and recompacted as necessary with mechanical compaction equipment, and the tops of any Aggregate Pier elements which may have been disturbed by footing excavation and related activity shall be recompacted to the original installed density.
   4. No excavations shall be made after installation of Aggregate Pier elements within a horizontal distance of five feet from the edge of any Pier, without the written approval of the Aggregate Pier Contractor/Engineer.

END OF SECTION

SECTION 31 91 00

LANDSCAPE WORK

PART I GENERAL

1.01 SCOPE

A. The work covered by these specifications consists of furnishing all plants and other materials, labor, equipment and services necessary to perform all operations in connection with the planting of trees, shrubs, groundcovers, and other such materials in compliance with these specifications and the applicable drawings, and subject to the terms and conditions of the Contract. **All disturbed areas inside the scope of work or construction limits shown on the Site Plan (Sheet A0.1) shall be sod.**

1.02 STANDARDS

A. The following standards, where applicable are to be considered a part of these specifications:
1. American Joint Committee on Horticulture Nomenclature, "Standard Plant Names," Latest Edition.
2. American Association of Nurserymen, Inc., "American Standard for Nursery Ctock," Latest Edition.
3. Mississippi Department of Agriculture and Commerce. "Mississippi Fertilizer Law," Rules and Regulations.
4. Mississippi Department of Agriculture and Commerce. "Mississippi Pure Seed Law", Rules and Regulations.
5. All other governing Federal, State and Local Laws, regulations and ordinances applicable to this project and the work described within these Contract Documents.

1.03 QUALITY ASSURANCE

A. Plants shall be subject to inspection and approval at the place of growth, or upon delivery to the site for quality, size, and variety. Such approval shall not impair the right of inspection and rejection at the site during progress of the work or after completion, for size and condition of form, balls or roots, latent defects, or injuries. Rejected plants shall be removed immediately from the site.

B. Plant materials shall comply with State and Federal Laws relating to inspection for diseases and insect infestation.

1.04 SUBMITTALS

A. Submit the following information:
1. Certificate of inspection of plant material as required by State and Federal authorities and manufacturer's or vendor's certified analysis for soil amendments and fertilizers.

2. Maintenance Distribution: Submit typewritten instructions recommending procedures to be established for maintenance of landscape work for one (1) full year.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery:

1. Notify Architect of delivery schedule in advance so that plant material may be inspected upon arrival at job site.
2. During shipping to the job site, all plant material shall be packed to provide adequate protection against climatic, seasonal, and breakage injury during transit. Tops shall be securely protected as necessary to minimize wind whipping and drying.
3. Where practical, do not deliver more plant materials than can be planted in one day.
4. Deliver all package material to site in original, unopened containers bearing the manufacturer's guaranteed chemical analysis, name of trademark and conformance to State law.

B. Storage

1. Plants that can not be planted immediately upon delivery shall be kept in shade and protected at all times from sun, drying winds, freezing and inclement weather, or damage as a result of construction operations and shall be kept well watered. Owner shall not be responsible for plant care during installation.

C. Packaged Materials:

1. Deliver packaged materials in containers showing weight, analysis and name of manufacturer. Protect materials from deterioration during delivery and while stored at site.

D. Handling:

1. Handle all plants so that roots are adequately protected at all times.
2. No plants shall be bound with rope or wire at any time so as to damage the bark, break branches, or destroy its natural shape.
3. Do not pick up container or balled plants by stems or trunks. Plants handled by stems or trunks shall be considered damaged and removed from the site.
4. Handle packaged material with care so as not to accidentally open containers or contaminate before time of actual use.

1.05 JOB CONDITIONS

A. Conduct planting operations under favorable weather conditions during the seasons which are normal for such work as determined by locally accepted practice, unless directed otherwise by the Landscape Architect.

B. Utilities: Determine location of underground utilities and perform work in a manner which shall avoid possible damage. Hand excavate, as required. Maintain grade stakes set by others until removal is mutually agreed upon by parties concerned.

C. Excavation: When conditions detrimental to plant growth are encountered, such as rubble fill, adverse drainage conditions, or obstructions, notify Landscape Architect before planting.

1.07 GUARANTEE

A. Guarantee new or existing moved plant material for a period of one (1) year from date of final acceptance.

B. Plant Replacement:
1. Any plant not found in a healthy growing condition at the end of the guarantee period shall be removed from the site and replaced as soon as weather conditions permit.

2. All replacements shall be plants of the same kind and size as specified on the plant list. They shall be furnished, planted and mulched as specified under "Planting", at no additional cost to the Owner.
3. Final inspection at the end of the guarantee period shall be on planting, construction and all other incidental work pertaining to this Contract. Any replacement at this time of replacement and ending with the same inspection and acceptance shall conform as herein described.

1.08 SCHEDULES

A. Coordinate work with other trades and professions on the job site. Do not begin work if there is danger of conflict or damage to work by others and professions in the normal pursuit of their work.

B. Plant material shall be placed where and as indicated on plan. Notify Landscape Architect of any conditions on site at time of planting that are not shown on plans and which make placing adjustments necessary. The Landscape Architect shall furnish to the Contractor written or orally communicated corrected positions.

C. Planting Schedule: Prepare a proposed planting schedule. Schedule dates for each type of landscape work during normal seasons for such work in areas on site. Correlate with specified maintenance periods to provide maintenance from date of substantial completion. Once accepted, revise dates only as approved in writing, after documentation of reasons for delays.

D. Coordination With Lawns: Plant trees and shrubs after final grades are established and prior to planting of lawns, unless otherwise acceptable to Architect. If planting of trees and shrubs after lawn work, protect lawn areas and promptly repair damage to lawns resulting from planting operations.

PART II MATERIALS

2.01 PLANT MATERIALS

A. All plants shall be well-formed and shaped, true to type, and conform to the measurements specified in the plant list. Plants that meet the requirements specified in the plant list, but which do not possess a normal balance between height and spread shall not be accepted. All plants shall be freshly dug (where applicable), healthy, vigorous, well-branched and free of disease, insect eggs, and larvae, and shall have adequate root systems.

B. Plant names and labels shall conform to the current edition of: Standard Plant Names as adopted by the American Joint Committee on Horticulture Nomenclature. All plants shall be true to name, quality and size as indicated in plant list.

C. Plants shall not be pruned prior to delivery.

D. Plants shall be nursery grown, unless otherwise specified and shall have been growing under similar climatic conditions to these in locality of project. Plants larger than those specified may be used if approved by Architect, but use of such plants shall not increase the Contract price. Root spread or root balls shall be increased in proportion to the size of the plant.

E. Substitutions shall be permitted only if proof is submitted that specified plants or sizes are unobtainable. Proposals shall be considered for nearest equivalent size or variety with equitable adjustment of Contract price. Substitutions shall be acceptable only upon written notice.

F. Plants shall be tagged with durable, legible tags stated in weather resistance ink the plant name and size as specified in the plant list. Labels shall be securely attached to all plants, bundles or packages of plants of a single species and size. Labels shall be removed from plants immediately after final acceptance. Notify Landscape Architect of removal for project closing.

G. Digging and Handling: All plant stock shall be dug and handled with reasonable care and skill to prevent injuries to the trunk branches and roots, and shall be packed in an approved manner to insure arrival at the project site in good condition.

H. Balled and Burlapped Plants:
1. Dig plants with firm, natural balls of soil and of sufficient size to encompass the fibrous and feeding roots of the plant. No balled plant shall be planted if the ball is cracked or broken, unless approved by the Architect.
2. Wrap ball securely with burlap or strong biodegradable cloth and bind tightly with rope or wire.
3. Container grown plants shall be accepted as balled and burlapped provided the plants have been growing in containers for at least one full growing season prior to delivery to the job site, and that containers are adequate for the developing root system of the plant.
4. In hot weather, maintain stock in shade house for a minimum of one week to allow plants to recover from digging shock.
5. Minimum size of each ball shall be equal to that required for the next larger size nursery grown stock.

I. Specified Plants: Specimen plants shall be selected for shape and branching habit which at maturity shall produce a strong, full foliaged example of its species.

J. Container Grown Stock:

1. All container grown material shall be healthy, vigorous, well-rooted and established in the container in which it is sold. Tops shall be of good quality and in a healthy growing condition.
2. Containers shall be sufficiently rigid to hold the ball shape protecting the root mass during transit.
3. Plants shall be established in their containers sufficiently long enough for the fibrous roots to have developed so that the root mass shall retain its shape and hold together when removed from the container.
4. Plants shall have small stakes in containers where required to support the plants. Plant roots bound in containers shall not be acceptable.

2.02 TOPSOIL

A. Topsoil shall be a natural, fertile, friable soil of loamy character capable of sustaining vigorous plant growth. It shall be free of stones, lumps, plants, roots, obnoxious grass and weeds, and other foreign matter. It shall be of uniform composition throughout, not excessively acid or alkaline, nor contain substances which may be harmful to plant growth. Existing on-site soil may be utilized in planting mix if existing soil is of good quality to promote healthy plant growth and is approved by the Landscape Architect.

2.03 PLANTING SOIL

A. All plant beds and plant pits shall have the following soil mixtures: One (1) part approved topsoil, one (1) part shart masonry sand, and one (1) part pine bark soil conditioner mixed into a good friable material.

Locally available pre mixed “soil mix” is acceptable if sample is pre approved by Landscape Architect. All planting areas shall receive an application of approved pre-emergent herbicide incorporated thoroughly into planting beds prior to installation of plant material. Apply herbicide at manufacturer's rates and procedures. Notify Architect prior to application of pre-emergent.

2.04 FERTILIZER

A. Commercial fertilizer shall be a complete fertilizer, uniform in composition, dry and free flowing. Deliver fertilizer to site in original, unopened containers, each bearing the manufacturer's statement of analysis. Commercial fertilizer shall be 13-13-13 formula 13% nitrogen, 13% phosphoric acid, 13% potash. Fertilizer shall be dry, granular and bagged in manufacturer's original unopened container.

B. Fertilizer shall not be applied to planting beds or pits unless otherwise specified by the Architect. Instead, apply Fertilome Root Stimulator or approved equal to beds and pits in compliance with manufacturer's recommended rates and procedures.

2.05 MULCH

A. Mulch to be seasoned pine bark, brown in color and sample to be approved prior to installation by Landscape Architect.

2.06 TREE WRAPPING

A. Tree wrapping shall be double thick crepe paper cemented together with bituminous material. Wrapping shall be a minimum of 4" wide and secured with a lightly tarred medium of coarse sissel yarn.

2.07 GUYING AND STAKING MATERIAL

A. Staking to be as shown on drawings mfg. by Tree Staple, Inc or equal and installed as shown.

2.08 WATER

A. All water necessary for planting and maintenance shall be of satisfactory quality to sustain the growth of plants and shall not contain harmful, natural, or man-made elements detrimental to plants. Potable water meeting the above standard shall be furnished by the Contractor, and the Contractor shall be responsible to make arrangements for its use by tanks, hoses, sprinklers, etc. If such water is not available at the site, the Contractor shall provide such satisfactory water from sources off the site. The Contractor shall be responsible for watering the plants until date of final acceptance.

PART III EXECUTION

3.01 INSPECTION

A. Verify establishment of final grades prior to beginning planting operations. Inspect plants for injury and insect infestation. Do not begin planting or wrapping of trees until deficiencies are corrected or plants replaced.

B. Inspect soil conditions to determine if soil is free of rubbish or objectionable matter harmful to plant growth. If any adverse conditions are found, notify the Landscape Architect.

3.02 PREPARATION

A. Stake out locations for plants and outline of planting beds on ground. Do not begin excavation until staking locations and plant beds are approved by Architect.

B. Slight changes may be made in plant location which conflict with utility lines. Such relocation is subject to the approval of the Architect.

C. Topsoil, pine bark soil conditioner and sand may either be pre-mixed or mixed in place by spreading all materials evenly until a homogenous mixture is achieved to full depth of bed as required.

D. Reasonable care should be exercised to have pits and beds dug and soil prepared prior to moving plants to their respective locations for planting to ensure that they will not be unnecessarily exposed to drying elements or physical damage.

3.03 EXCAVATION FOR PLANTING

A. Plant pits shall be circular in outline with vertical sides and flat bottoms. Prepare all pits six inches deeper than ball or container size to be received. Shrub pits shall be a minimum of sixteen inched in depth, and tree pits shall be a minimum of 20 inches in depth. Shrub pits shall be a minimum of 1 1/2 times greater in diameter than plant ball. Tree pits shall be a minimum of twelve inches greater in diameter than ball for trees up to three inch caliper, and a minimum of eighteen inches greater for trees over three in caliper. Groundcover beds shall be prepared uniformly to a depth of nine inches. Shrub beds utilizing mass planting shall be uniformly excavated to the required depth. No such beds shall be prepared by digging pits each shrub.

3.04 PLANTING

A. Center plant in pit or place so required in bed and face for best effect. Place sufficient planting soil under plant as required to raise plant 1 1/2 to 2 inches above existing grade so that after settlement it bears same relation to finish grade as it bore to the grade of the soil which it was dug. Set plant plumb and hold rigidly in position until soil has been tamped firmly around root ball. Plant pit or bed shall be backfilled with planting soil in 1" layers, each carefully tamped in place to avoid injury to roots or two-thirds of depth, fill pit or bed with water to settle soil around roots. After soil settles, fill remainder of pit or bed with planting soil, water and tamped lightly to grade. Rake smooth to drain.

B. Balled plants shall be planted in pit on planting soil material that has been handtamped prior to placing plant. Set plumb and straight 1 1/2 inches above the existing grade as above. Cut burlap or cloth, ropes, wire, or other wrapping material and remove from top 1/3 of ball. Do not pull wrapping from under ball. Do not plant if ball is cracked or broken before or during planting process.

C. For container grown plants, cut cans on two sides with an acceptable can cutter, taking care not to damage root ball. Do not cut sides on knockout cans. Carefully remove plants so as not to damage root ball. After removing plant, scarify edge roots on three sides. Plant as above. For containers less than one gallon in size, place plants backfill and tamp by hand, leaving slight depression around base of plants. Cover root ball with a maximum of 1/4" of planting soil.

D. Build 4" saucer continuous around all plants or trees which stand alone and are not in larger mulched beds. Construct saucer of planting soil and tamp firmly in place to retain shape.

E. Spray Plants with anti-desiccant within 24 hours after planting.

3.05 MULCHING

A. Mulch all planting pits and beds immediately after planting, covering the entire area around each plant to the depth required. Water thoroughly immediately after mulching. (See "Water, this section, for Contractor's responsibility to water planted stock and "Maintenance".)

3.06 GUYING AND STAKING

A. Trees shall be staked with tree staple while planting. Trees shall stand plumb with tree staple for a period of one year.

3.07 PRUNING

A. Each tree (and shrub, if required) shall be pruned in accordance with standard horticultural practice to protect natural character of plant. Pruning shall be done with clean, sterile, sharp tools.

B. Prune new plant material as required to remove injured twigs and branches, deadwood and suckers. For newly planted trees, remove 1/3 to 1/4 of branching structure to compensate for root loss. Make all cuts flush with trunk or adjacent branch.

3.08 WRAPPING

A. Trees shall be wrapped immediately after planting, winding from the ground line to above the lowest main branches. Overlap wrapping approximately 2" and tie securely in place. Maintain in place for one year.

3.09 MAINTENANCE

A. All plants and planting included in this Contract shall be maintained by watering, cultivating, spraying, and other operations necessary to insure a healthy condition until Architect makes final acceptance and submits certificate for payment. Maintenance from this day forward shall be the responsibility of the Owner.

3.10 CLEAN-UP

A. As planting operations proceed, all rope, wire burlap, empty containers, rocks, clods and all other debris pertinent to this work shall not be allowed to accumulate but shall be removed daily and the site kept as neat as possible at all times.

END OF SECTION

SECTION 32 31 13
CHAIN LINK FENCES

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Fence framework, fabric, and accessories.

B. Excavation for post bases; concrete foundation for posts.

C. Vehicular Sliding Gates.

D. Manual gates and related hardware.

1.02 REFERENCE STANDARDS

A. ASTM A121 - Standard Specification for Metallic-Coated Carbon Steel Barbed Wire; 2013.

B. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products; 2015.

C. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware; 2009.

D. ASTM F567 - Standard Practice for Installation of Chain-Link Fence; 2011.

E. ASTM F1083 - Standard Specification for Pipe, Steel, Hot-Dipped Zinc-Coated (Galvanized) Welded, for Fence Structures; 2013.

1.03 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with not less than three years of documented experience.

PART 2 PRODUCTS

2.01 MATERIALS

A. Posts, Rails, and Frames: ASTM F1083 Schedule 40 hot-dipped galvanized steel pipe, welded construction, minimum yield strength of 30 ksi.

B. Wire Fabric: ASTM F 668 polymer-coated steel chain link fabric.

C. Barbed Wire: Zinc-coated steel, complying with ASTM A 121 Type Z Coating Class 3; 3 strands of 0.099 inch diameter wire, with 4-pointed barbs at 5 inches on center.

D. Concrete: ASTM C 94/C 94M, ready-mixed; Normal portland Cement, 2,500 psi strength at 28 days, 3 inch slump;.5 inch nominal sized coarse aggregate.

2.02 COMPONENTS

A. Line Posts: 2.38 inch diameter.

B. Corner and Terminal Posts: 3.5 inch.

C. Gate Posts: 3.5 inch diameter.

D. Top and Brace Rail: 1.66 inch diameter, plain end, sleeve coupled.

E. Gate Frame: 1.66 inch diameter for welded fabrication.

F. Fabric: 2 inch diamond mesh interwoven wire, 9 gage thick, top selvage twisted tight, bottom selvage twisted tight. Fabric to be colored vinyl where called for in plans.

G. Tension Wire: 6 gage, 0.1620 inch thick steel, single strand.

H. Tension Band:.125 inch thick steel.

I. Tension Strap:.125 inch thick steel.

J. Tie Wire: Aluminum alloy steel wire.

2.03 ACCESSORIES

A. Caps: Cast steel galvanized; sized to post diameter, set screw retainer.

B. Fittings: Sleeves, bands, clips, rail ends, tension bars, fasteners and fittings; steel.

C. Extension Arms: Cast steel galvanized, to accommodate 3 strands of barbed wire, single arm, sloped to 45 degrees.

D. Hardware for Single Swinging Gates: 180 degree hinges, 2 for gates up to 72 inches high, 3 for taller gates; fork latch with gravity drop and padlock hasp; keeper to hold gate in fully open position.

E. Hardware for Double Swinging Gates: 180 degree hinges, 2 for gates up to 72 inches high, 3 for taller gates; drop bolt on inactive leaf engaging socket stop set in concrete, active leaf latched to inactive leaf preventing raising of drop bolt, padlock hasp; keepers to hold gate in fully open position.

2.04 FINISHES

A. Components (Other than Fabric): Galvanized in accordance with ASTM A123/A123M, at 1.7 oz/sq ft.

B. Hardware: Hot-dip galvanized to weight required by ASTM A153/A153M.

C. Accessories: Same finish as framing.

2.05 SLIDING VEHICULAR GATES

A. A.Gate Panel and Lock
   1. Gate Panel:
      a. Utilize sealed ball bearing internal rollers that provide protection against tampering and inclement weather.
      b. Gate Material: Aluminum
      c. Hardware: Galvanized and Stainless Steel.
   2. Sliding Gate Lock:
      a. Waterproof, tamper-resistant, electrically operated with six tumbler mechanical release.
      b. Include Status Indication for locked or unlocked position monitoring.
   3. Catcher Assembly:
      a. Prevent deflection by pedestrian intrusion using providing gate design to resist deflection at ends.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install framework, fabric, accessories and gates in accordance with ASTM F567.

B. Place fabric on outside of posts and rails.

C. Set intermediate posts plumb, in concrete footings with top of footing 2 inches above finish grade. Slope top of concrete for water runoff.

D. Line Post Footing Depth Below Finish Grade: ASTM F567.

E. Corner, Gate and Terminal Post Footing Depth Below Finish Grade: ASTM F567.

F. Brace each gate and corner post to adjacent line post with horizontal center brace rail and diagonal truss rods. Install brace rail one bay from end and gate posts.

G. Provide top rail through line post tops and splice with 6 inch long rail sleeves.

H. Install center brace rail on corner gate leaves.

I. Do not stretch fabric until concrete foundation has cured 28 days.

J. Position bottom of fabric 2 inches above finished grade.

K. Fasten fabric to top rail, line posts, braces, and bottom tension wire with tie wire at maximum 15 inches on centers.

L. Attach fabric to end, corner, and gate posts with tension bars and tension bar clips.

M. Install bottom tension wire stretched taut between terminal posts.

N. Install support arms sloped outward and attach barbed wire; tension and secure.

O. Install Vehicular Sliding Gate as per manufacturer's recommendations.

P. Install gate with fabric and barbed wire overhang to match fence. Install hardware.

Q. Provide concrete center drop to footing depth and drop rod retainers at center of double gate openings.

3.02 TOLERANCES

A. Maximum Variation From Plumb: 1/4 inch.

B. Maximum Offset From True Position: 1 inch.

C. Components shall not infringe adjacent property lines.

END OF SECTION

SECTION 33 10 00
WATER DISTRIBUTION SYSTEMS

1.0 GENERAL

This item shall consist of furnishing all of the necessary materials, supervision, labor, tools, equipment and incidentals, and the installation of various types and sizes of water pipe and related items in accordance with the Contract Drawings and Specifications, as stated in the Proposal.

2.0 APPLICABLE PUBLICATIONS

The following publications form a part of these Specifications and where referred to by basic designation only, are applicable to the extent indicated. The latest editions of the publications referenced shall apply to the work.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)

A 139 Electric-Fusion (Arc) welded steel pipe (sizes 4 inch and over).

A 252 Welded and Seamless steel pipe piles.

C 31 Making and Curing Concrete Compressive and Flexural Strength Test Specimens in the Field.

C 33 Concrete Aggregates

C 39 Test for Compressive Strength of Cylindrical Concrete Specimens.

D 2922 Density of Soil Aggregate in place by the Nuclear Method (shallow depths).

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

21.10 Gray Iron and Ductile Iron Fittings, 3 inch through 48 inch for Water and other Liquids.

21.11 Rubber Gasket Joints for Cast Iron and Ductile Iron Pressure Pipe and Fittings.

21.50 Ductile Iron Pipe, Centrifugally Cast in Metal Molds or Sand-lined Molds, for Water or other Liquids.

AMERICAN WATER WORKS ASSOCIATION (AWWA)

C 104 Cement-Mortar Lining for Cast Iron Pipe and Fittings for Water and Other Liquids.

C 106 Cast Iron Pipe Centrifugally Cast in Metal Molds, for water and other Liquids.

C 110 Gray Iron and Ductile Iron Fittings, 3 inch through 48 inch, for Water and Other Liquids.

C 111 Rubber Gasket Joints for Cast Iron and Ductile Iron Pressure Pipe and Fittings.

C 150 Ductile Iron Pipe, Centrifugally Cast in Metal Molds or Sand-Lined Molds, for Water or other Liquids.

AMERICAN ASSOCIATION OF STATE HIGHWAY & TRANSPORTATION OFFICIALS (AASHTO)

T-88 Particle Size Analysis of Soils.

T-89 Determining the Liquid Limit of Soils.

T-90 Determining the Plastic Limit and Plasticity Index of Soils.

T-99 Moisture Density Relations of Soils Using a 5.5 lb. Rammer and 12 inch Drop.

T-191 Density of Soil In-Place by the Sand-Cone Method.

3.0 SUBMITTALS

The following submittals shall be required for the respective materials used in the work. All submittals shall be submitted through the Contractor to the Engineer.

3.01 Ductile Iron Pipe: The following submittals shall be required for ductile iron pipe systems utilized on the project. The Contractor shall furnish manufacturer's certificates certifying that the pipe and fittings conform to the requirements as specified hereinafter under Article 4.0, Materials. In addition, the submittals shall include the following:

A. Joints: The following shall be required for ductile iron joints.

1. Drawings or Manufacturer's Catalogue data indicating dimensions and tolerance.

2. Gaskets shall be tested in accordance with the respective standards as indicated in ANSI 21.11 and results shall be included in the submittals. Test shall be for similar materials on the gaskets and be not more than one year old.

3. Mechanical Joints: Should the Contractor elect to use mechanical joints in lieu of push-on joints, manufacturer's data shall be submitted in accordance with the "Special Requirements for the Mechanical Joint" as stated in ANSI 21.11 (AWWA C 111).

B. Ductile Iron Pipe Submittal Shall Include the Results of:

1. Tension Test

2. Impact Test

3. Low Temperature Impact Test

Sampling procedure shall be as indicated in ANSI 21.51.

3.02 PVC PIPE

The Contractor shall furnish manufacturer’s certificates certifying that the pipe and fittings conform to the requirements of these specifications and appropriate construction drawings.

4.0 MATERIALS

A. Ductile Iron Pipe

Ductile iron pipe shall be designed in accordance with the latest revision of ANSI/AWWA C51/A21.51), rated working pressure of 350 psi plus a100 psi surge allowance; a 2 to 1 safety factor on the sum of working pressure plus surge pressure in Type 3 laying condition with a depth of cover as required per plans.

Pipe shall have standard asphaltic coating on the exterior. Pipe also shall have a cement mortar lining on the interior in accordance with the latest revision of ANSI/AWWA C104/A21.4. If corrosion protection is required, polyethylene encasement shall be installed prior to the pipes installation in accordance with ANSI/AWWA C105/A21.5-88.

All non-restrained pipe shall be furnished with push-on type joints such as "Fastite", or equal. Joints shall be in accordance with the latest revision of ANSI/AWWA C111/A21.11 and shall be furnished complete with all necessary accessories.

Where restrained joint pipe is required, "Fast Grip", "Flex-Ring", or "Field Flex-Ring" or approved equal shall be used. The length of restrained pipe shall be as tabulated or noted on the plans.

Ductile iron fittings shall conform to the latest revisions of either ANSI/AWWA C110/A21.10 or ANSI/AWWA C153/A21.53. Fittings, linings, and coatings shall be as specified for the pipe above.

All pipe, fittings and accessories shall be installed and tested in accordance with the latest revision of AWWA C600. Newly installed ductile iron water mains shall be disinfected in accordance with the latest revision of AWWA C651 prior to placing in service.

B. PVC Pipe

PVC pipe for this project shall be PVC, either C-900, Class 200 for fire lines or SDR-26 for domestic water lines. PVC pipe shall bear the National Sanitation Foundation seal for potable water.

The pipe shall be equipped with a push on joint is a single elastomeric gasketed joint. It is assembled by positioning the elastomeric gasket in the annular groove of the bell and inserting the spigot end of the pipe into the bell. The spigot end of the pipe compresses the gasket radially to form a positive seal. The gasket and annular groove are designed, sized and shaped so that the gasket will resist displacement. Care shall be taken so that only the correct elastomeric gasket, compatible with the annular groove of the bell, is used. Insertion of the elastomeric gasket in the annular groove of the bell must be in accordance with the manufacturer's recommendations.

C. Gate Valves

Where indicated on the Plans or directed by the ENGINEER, the CONTRACTOR shall furnish and install gate valves as hereinafter specified.

All gate valves shall be cast iron mechanical joint, M.J., Mueller A-2380-20, equivalent or better.

All gate valves shall be furnished with O-ring packing and 2" square operating nut, AWWA 200lb., for cast iron water main.

Valve boxes shall be cast iron top and bottom. Extension pieces shall be provided as required.

Payment for furnishing and installing gate valves with box shall be made at the contract unit price per valve according to type and size as listed in the proposal.

All valves will be set at a perfect 90 degree angle from level pipe, (perpendicular) so as to be easily accessible through properly set valve box as per the specifications above.

The CONTRACTOR shall furnish and install either a two-piece or three-piece, slip type, cast iron valve box over each gate valve. Valve boxes will be set over valve operating nut, centered so as to be easily accessible with a valve operating wrench or key. They will be set to correspond with the finished grade of street, lot, or easement. No dirt will be left in box; box will not rest directly on valve body.

D. Fittings, Valves and Hydrants, Etc.

All fittings, valves and valve boxes, hydrants, and other appurtenances are to be set at the points indicated on the plans, or as directed by the ENGINEER and omission to do so shall be corrected by the CONTRACTOR without extra cost to the OWNER.

All fitting shall either be Ductile Iron Compact (ANSI/AWWA C153/A21.53) or Cast Iron (ANSI/AWWA-C110/A21-10) and shall have mechanical joint ends and mechanical joint restraints (Series 1120) and shall be incorporated in the design of the follower gland and shall include a restraining mechanism which, when actuated, imparts multiple wedging action against the pipe, increasing its resistance as the pressure increases. Flexibility of the joint shall be maintained after burial. Glands shall be manufactured of ductile iron conforming to ASTM A 536-80. Restraining devices shall be of ductile iron heat treated to a minimum hardness of 370 BHN. Dimensions of the gland shall be such that it can be used with the standardized mechanical joint bell and tee-head bolts conforming to ANSI/AWWA A21.11 and ANSI/AWWA C153/A21.53 of latest revision. Twist-off nuts shall be used to insure proper actuating of the restraining devices.

The mechanical joint restraint device shall have a working pressure of a least 250 psi with a minimum safety factor of 2:1 and shall be EBAA Iron, MEGALUG or equal.

To improve the sealing capacity, the gaskets for all mechanical joints conforming to the requirements of ANSI/AWWA C110/A/21.10, C111/A21.11, or C153/A21.53 shall be of a design that causes the gasket to deflect approximately 30% during assembly of the mechanical joint. The gasket material shall conform to the requirements of ANSI/AWWA C111/A21.11, Section 1-6.4 of the latest revision. Mechanical joint gaskets shall be EBAA Iron's EBAA Seal- Improved Mechanical Joint Gasket or approved equal.

Fittings (bends, tees, plus, and caps) shall be securely braced by mechanical joint restraints, as indicated on the Plans, to prevent the possibility of blowing off under pressure. And a full length of pipe shall be installed on each end of the fitting. Then cut pieces can be installed beyond the full lengths of pipe.

The prices bid furnishing and installing valves, fittings, etc., shall include compensation for furnishing mechanical joint restraints as required at beds, tees, plugs and caps. No separate or extra compensation will be allowed for any of the above specified incidental work or material.

E. Plugs and Caps

Where indicated on the Plans, or as directed by the ENGINEER, the CONTRACTOR shall install plugs for anticipated future extensions by placing a branch fitting (tee or cross) in the line and plugging the unused branch or branches. In general, such plugs will be located at street intersections where present plans provided lines

running in only two or three directions from the intersections and where, in the opinion of the ENGINEER, a connection may be required for future extension. Where "dead end" lines are installed, the ends of such lines shall be plugged or capped as required.

For the various hot taps required according to the plans, and up to 12 inches, the JCM 432, stainless Tapping Sleeve shall be required. The CONTRACTOR shall furnish all materials for these various taps and the OWNER will actually make the tap.

F. Casing Pipe

Steel pipe utilized as casing at locations shown on the Contract Drawings shall be new round piling pipe conforming to the requirements of ASTM A 252 or A 139. Casing diameter shall be adequate to allow pushing of the specified diameter of water pipe and make proper connections at the ends. Minimum Wall Thickness for steel casing is 0.375 inch. All casing shall have projection type non-metallic spacers constructed of preformed section of high density polyethylene. Spacers shall be RACI type spacers from Public Works Marketing, Inc. or approved equal.

G. Wash Gravel Bedding Material

Select Granular material for pipe bedding shall be coarse concrete aggregate. The coarse concrete aggregate shall conform to the gradation sizing Number 467 specified in Table 2 of ASTM Standard Specification C-33. (See Following Table)

SIZE NO. 467	
Nominal Size (Sieves w/Square Openings)	Percent Passing by Weight
2"	100
1 - 1/2"	95 - 100
3/4"	35 - 70
3/8"	10 - 30
No. 4	0 - 5

H. Stabilization Material:

Stabilization Material shall be a pit run mixture of sand and gravel. The sand shall be hard, sharp and durable particles. All gravel shall pass a 1 - 1/2" sieve.

I. Concrete

Concrete shall be in accordance with the requirements of Technical Specifications - CONCRETE

J. Select Backfill

General: The select material shall be composed of a natural or artificial mixture of sand, silt, clay or soil binder or other material of satisfactory cementing value. The sand shall be hard, sharp, and durable particles,

preferably siliceous. The binder shall be a grade of clay or other material having satisfactory cementing qualities and shall be homogenous in character, free from vegetable matter, clay balls or other deleterious substances that cannot be classed as serviceable base material.

Gradation: Any coarse aggregate contained in the material shall pass the one and one-half (1-1/2); sieve and not more than thirty-five percent (35%) shall be retained in the Number 10 sieve. The plasticity index (P.I.) shall not exceed 12 or less than 5, nor shall the liquid limit exceed 30.

The composite selected sand-clay material passing the Number 10 sieve shall conform to the following minimum and maximum gradation limits:

Sieve	Percent Passing by Weight
Number 40	40-85
Number 60	30-70
Number 270	8-29
Silt (.05 to .005mm)	3-14
Clay (Passing .005mm)	3-14

K. Backfill

All other backfill shall consist of excavated material removed from the trench.

5.0 CONSTRUCTION

EARTHWORK:

A. Site Preparation: Topsoil shall be stripped and stockpiled in accordance with other Technical Specifications.

All vegetation such as brush, heavy sod, heavy growth of grass, decayed vegetative matter, rubbish and any other unsuitable material within the area of trenching shall be stripped or otherwise removed before the trenching is started, and in no case shall such objectionable material be allowed in the trench.

Stripping operation shall be to a depth of not less than 6 inches in all cases.

B. Asphalt or Concrete Removal: Before trenching operations begin, the existing asphalt or concrete pavement shall be scored or cut to a proper depth to give a straight vertical edge when removed. The asphalt or concrete shall be disposed of offsite by the Contractor. While removing the asphalt or concrete in the trench line, never shall the adjacent asphalt be raised or pulled from its base.

C. Trenching: The Contractor shall determine all requirements for trench dimensions, alignment, and grades. The trench shall be excavated in conformance with all federal, state and local regulations for the protection of

the workmen. Shoring, sheeting and/or a moveable form shall be used as required to provide earth stability during the laying operations.

The final excavation of the trench for the pipe installation shall be as indicated on the Plans. Minor variations in horizontal (within the permanent easement) or vertical alignment during construction shall be made during construction (with the Engineer's approval) to facilitate ease of installation and operation (due to potential conflicts; i.e., utility conflict) at no additional cost to the Owner except for additional piping, if any. The trench from the top of the pipe down to the bottom of the bedding shall be of a consistent width as indicated on the plans. Should the excavated width of the trench be larger than the design width, the Engineer may direct that a higher type or class of bedding be used; or other adjustments be made to increase the load carrying capacity of the pipe.

The Contractor shall not excavate more trench in advance of pipe laying than is necessary to perform the work efficiently. No more than 100 feet of open trench shall be allowed unless approved by the Engineer.

Excavated material shall be place in a manner that will not obstruct sidewalks, driveways, or other structures. Excavated material shall not be placed so as to surcharge the walls and jeopardize trench stability.

D. Disposal: The Contractor shall satisfactorily dispose of all excess earth from excavations either in approved (by the Engineer) areas within the construction limits or away from the project in disposal sites obtained by the Contractor.

The Contractor will be permitted to mound excess earth over the trench to a maximum depth of 12 inches above the original ground surface or finished grade where the trench is located in unimproved property. Wasting of excess excavated material will not be permitted within any road ROW. All material within the construction limits shall be placed so that natural drainage is maintained and the surface shall be graded to a smooth and uniform appearance. The disposal of waste and excess excavating materials, including hauling, handling, grading, and surfacing shall be subsidiary obligation of the contractor and no separate payment will be made. Therefore, the cost of such work shall be included in the Contract Unit Price for installation of water pipe.

E. Dewatering: The site shall be kept free of surface water at all times. The Contractor shall install drainage ditches and dikes and shall perform all pumping and other work necessary to divert or remove rainfall and other accumulations of surface water from the excavations. The diversion and removal of surface water performed in a manner that will prevent the accumulation of water behind temporary structures or at any other locations within the construction area where it may be detrimental. The Contractor shall provide, install, and operate sufficient trenches, sumps, pumps, hoses, piping, well points, deep wells, etc., necessary to depress and maintain the ground water level at least one foot below the base of the excavation during all stages of construction operations. The ground water table shall be lowered in advance of excavation and maintained a minimum of one foot below the lowest excavation subgrade made until the structure has sufficient has sufficient strength and weight to withstand horizontal and vertical soil and water pressures.

Where groundwater is encountered, the Contractor shall make the effort necessary to secure a dry trench bottom before laying pipe. In sandy and in other suitable type soils, dewatering shall be done by well pointing. If, in the opinion of the Engineer, the Contractor has failed to obtain an absolutely dry trench bottom by

insufficient use of all known methods of trench dewatering, the Engineer may order the Contractor to excavate below grade and place not less than 6 inches of graded crushed stone fill material over the trench bottom to form trench drains to suitably located sumps and to remove the water by bailing or pumping. The graded crushed stone fill material shall be placed at the Contractor's own expense and shall be of such depth that there shall be not water in bell holes at the time of coupling pipe. All costs of equipment, labor, and materials required for dewatering shall be included in the bid price.

F. Bedding: The Contractor shall satisfactorily shape the trench area (to specified line, grade and cross section) to receive bedding material. The bottom of the trench shall be undisturbed soil. Should the Contractor over excavate the trench without direction from the Engineer, the trench shall be brought up to grade with select backfill and compacted to at least 90% of maximum laboratory density as measured by AASHTO T 99. Such additional work and materials for over excavation without direction of the Engineer shall be at the expense of the Contractor.

Holes for the bells shall be provided at each joint in the subgrade or in the granular fill bedding material as required. The holes shall be no larger than necessary for joint assembly and assurance that the pipe barrel will lie flat on the material. The Contractor shall install the proper bedding for the respective type of pipe and depth of installation as shown in the details and schedules on the plans. When depths vary in a particular run, the Contractor shall change bedding systems in accordance with the depth installation requirements.

1. Stabilization Materials: When the subgrade is found to be unstable or to include ashes, refuse, organic material, or other unsuitable material, the Engineer may direct that the subgrade be over excavated to remove such material. The depths of over excavation shall be as directed by the Engineer. Stabilization material shall be placed into the over excavated area of the trench and shall be paid for in accordance with these specifications. Stabilization shall be compacted to at least 90% of maximum laboratory density in six inch lifts.

2. Bedding Materials: As detailed in the plans, bedding material shall be placed to the specified depth below the pipe and tamped to a minimum of 90% of maximum laboratory density as determined in accordance with AASHTO T 99. Following placement of pipe, additional bedding material shall be placed and consolidated under the haunches of the pipe. Special tools shall be required to work the material into place and leave no voids beneath the pipe. The bedding material shall be tamped along the spring line (or along the top of the bedding material as indicated) of the pipe to sufficiently compact the material insofar as practical.

3. The Engineer may direct additional moisture be added to the bedding material to aid in the compaction effort. Mechanical tampers may be employed to aid the process depending on the particular bedding required, additional bedding shall be added and tamped to a minimum of 90% of maximum laboratory density, with AASHTO T-99.

4. Select Backfill: Select backfill shall be placed in 6 inch lifts and tamped to a minimum laboratory density with AASHTO T-99. Overall depth of the select backfill shall be as directed by the Engineer.

5. Normal Condition Bedding: Under normal conditions the trench bottom shall be undisturbed earth shaped to the specified line, grad, and cross section with proper bell holes at each joint to insure that pipe barrel lies flat on trench bottom. The bedding material will be selected native materials excavated

from the trench and placed in two lifts. The first lift being placed up to the spring line of the pipe and extending out to the trench walls and hand tamped to a minimum of 90% of maximum laboratory density. Special care shall be used in placing and tamping bedding to insure no voids under the haunches of the pipe. The second lift shall extend to approximately 6" above pipe (Material permitting) and hand tamped to 90% density.

6. Backfilling: Upon completion of placement of select material the excavated materials shall be immediately placed back into the trench. Specific requirements are:

    a. Backfill requirements for road crossings, parking lots, driveways, and sidewalks shall be in accordance with other Technical Specifications.

    b. Backfill requirements for unimproved areas (pastures, wooded areas) shall consist of placement and shaping of the soil in such a manner as to allow maximum natural consolidation. No compaction of the general backfill in the unimproved areas will be required, except that caused by conventional shaping equipment.

    c. No debris shall be used as backfill which has a volume in excess of one-half of one cubic foot or weight excess of 75 pounds.

2. Sheeting Removal: Wooden sheeting or other thick sheeting or shoring members which have been driven or otherwise placed along the trench walls to an elevation below the spring line of the pipe shall be cut off at the spring line or higher and left in place.

3. Grading and Grassing: Final grading and grassing shall be in accordance with Plans and Specifications.

PIPE HANDLING AND STORAGE:

Pipe shall be handled, staked, and stored in accordance with manufacturer's printed literature. The Contractor shall provide security as required to prevent damage by vandals. PVC pipe shall be shaded from sunlight for extended lengths of time. Pipe damaged during storage and handling shall be rejected.

PIPE LAYING:

Each pipe shall be laid true to line and grade and in such manner as to form a close concentric joint with the adjoining pipe and to prevent sudden offsets of the flow line. As the work progresses, the interior of the water shall be cleared of all dirt and superfluous materials of every description. Where cleaning after laying is difficult because of small pipe size, a suitable swab or drag shall be kept in the pipe and pulled forward past each joint immediately after the jointing has been completed. Trenches shall be kept free of water and pipe shall not be laid when the condition of the trench or the weather is unsuitable for such work. At times when work is not in progress, open ends of pipe and fittings shall be securely and satisfactorily closed so that no trench water earth or other substance will enter the pipe or fittings.

The water main shall maintain a minimum of 30 inches of cover at all times.

Pipe laying shall be performed in such a manner that no foreign material enters the pipe. The Engineer may require that before lowering pipe, heavy canvas bags be placed over each end, and left in place until joints are ready to be made. If water is in the trench, the seals shall remain in place until the trench is pumped completely

dry. If conditions are unsuitable, no pipe shall be laid until satisfactory laying conditions are obtained in accordance with the above specified requirements.

PIPE JOINTING:

Piping shall be jointed in accordance with the manufacturer's printed recommendations. Gaskets shall be firmly set within the bells and grooves as required. The manufacturer's recommended lubricant or an approved equal shall be applied for slip type joints.

Ductile Iron Pipe Joint Construction: The installation and jointing of ductile iron pipe shall generally conform to the applicable provisions of AWWA Standard Specifications C-600 for pipe laying.

Where mechanical joint pipe is used, the surfaces which come in contact with the gasket shall be thoroughly brushed with a wire brush just prior to assembly. The gasket should be brushed with soapy water prior to installation to remove loose dirt and to lubricate gasket as it is forced into its retaining space.

When tightening bolts, it is essential that the gland be brought up toward the pipe flange evenly. The bolts should be partially tightened; the bottom bolt first, then the top; next the bolts on either side; and last, the remaining bolts. Overstressing of bolts to compensate for poor installation will not be permitted. Bolt torque shall be in accordance with manufacturer's specifications.

All joints of whatever type shall be completely water tight after being subjected to the required tests.

BORINGS:

Borings shall be accomplished in accordance with Mississippi Department of Transportation Standards. The contractor shall provide all necessary sheeting, bracing, cribbing, supports and appurtenances to insure the proper line and grade throughout the entire length of the crossing.

A. Casing Pipe: Casing Pipe shall be installed as indicated on the Contract Drawings. Joints shall be completely welded to provide structural integrity and shall be watertight.

B. Carrier Pipe: Carrier pipe may be any of the allowed options of piping. However, the piping and joints shall be capable of withstanding the stress exerted by pushing the pipe within the casing.

C. Carrier Pipe Supports: Supports for the carrier pipe shall be as recommended by the manufacturer for such installation. Supports shall be spaced to adequately support the piping under all conditions.

D. Casing Seal: The annulus between the casing and carrier pipe shall be sealed at each end by installing WMSON Type U end seals, as manufactured by T.D. Williamson, Inc. Tulsa, Oklahoma, or equal, in accordance with the instructions of the manufacturer of the seals.

SEPARATION OF WATER AND SEWER MAINS:

The water and sewer specifications should state that the water line be constructed no less than 10 feet horizontally and 18" vertically with water line over sewer line. If those conditions cannot be met then they will be decided on a case by case basis.

6.0 TESTING

DUCTILE IRON PIPE:

A. Field Inspection: The Engineer shall perform visual inspection of the material prior to placement by the Contractor. The Engineer may make non-destructive tests to determine the soundness of the pipe. The Contractor shall assist the Engineer in handling and moving the pipe as required.

B. Material Test: Material test shall be conducted during the manufacturing process and the results shall be included as part of the submittals. No other material test shall be required.

STEEL CASING PIPE:

Material test shall be included as part of the submittal. No other material test shall be required.

COMPACTION TESTS:

Compaction tests shall be performed in accordance with AASHTO T 191 or ASTM D 2922. Maximum compaction shall be determined in accordance with AASHTO T 99. Compaction tests for water pipe related work shall not be less than as follows:

AASHTO T-99 or ASTM D 2922	AASHTO T-191
Stabilization Material	One per 100 CY
Bedding Material	One per 600 LF
Tamped Backfill	One per 600 LF

HYDROSTATIC TESTING:

After the pipe has been laid, all newly laid pipe or any valved section thereof shall be subjected to a hydrostatic pressure of at least 1.5 times the working pressure at the point of testing and not less than 1.25 times the working pressure along the test section, for a minimum of 2 hours.

And all tests shall be in accordance with AWWA Standard C600-82, Section 4.

Allowable leakage shall be no more than that determined by the following formula:

$$L = \frac{SD\sqrt{P}}{133{,}200}$$

In which:

L is the allowable leakage in gallons per hour;
S is the length of pipe tested in feet;
D is the nominal diameter of the pipe, in inches; and
P is the average test pressure during the leakage test in pounds per square inch.

These tests are to be made a the Contractor's expense and he is to provide all necessary fittings, equipment, appliances and any other necessary items to conduct the tests in a manner satisfactory to the ENGINEER. All costs incidental to conducting these tests are to be included in the prices bid for the various items of construction as no separate or extra compensation is to be allowed therefore. Record of testing is to be furnished to the OWNER.

CLEANING AND STERILIZING:

Before each section of work is placed in service, it shall be thoroughly flushed to remove any dirt or other foreign material from inside the lines; and the inside of the lines shall be sterilized by pumping into and though them as solution of chlorine of 50mg/l for 24 hours in such manner as to meet the requirements of the State Board of Health.

At least two (2) samples of chlorine free water, taken from each section shall be submitted to the State Board of Health for examination to determine if the system is free from organisms of the Coli-Aerogenes group. If such samples are not negative from organisms of the Coli-Aerogenes group, the system shall be disinfected and redisinfected in a manner meeting the requirements of the State Board of Health, until the system is freed of contamination.

All water mains will be flushed, chlorinated and rechlorinated until two (2) consecutive negative water samples are obtained by the Local Health Department. The samples shall be collected by the Certified Operator of the system or the Professional Engineer of the project.

The CONTRACTOR shall be responsible for the conduct of all of the above defined activities, and any and all costs incident thereto shall be included in the prices bid for the various items of construction as no separate or extra compensation is to be allowed therefore.

END OF SECTION

SECTION 33 14 00
SEWER/WATER UTILITY – TRACE WIRE SPECIFICATION

1.0 GENERAL

All trace wire shall have HDPE insulation intended for direct bury, color coated per APWA standard for the specific utility being marked. THHN is prohibited from use in the tracer wire system.

All trace wire, test stations and accessories shall be supplied by a single manufacturer and domestically made in the USA.

All tracer wire and accessories shall be installed per plan details and per manufacturers recommended installation methods. All wire and connectors shall be rated for direct bury applications.

2.0 MATERIALS

Copper Clad Steel (CCS) Trace Wire
Open Trench – 12 Gauge Copper Clad Steel with a Break Load of 452 pounds
Directional Drilling - 12 Gauge Copper Clad Steel with a Break Load of 1,150 pounds
Connectors
2-Way Splice Connector with Strain Relief
3-Way Connector
Termination/Access/Test Stations
Non-Roadway: Equal to Copperhead LD14TP
Concrete / Driveway: Equal to Copperhead CD14TP
Roadway: Equal to Copperhead RB14TP
Fire Hydrant: Equal to Copperhead T2-FLPKG
Grounding
Magnesium Anode: Equal to Copperhead ANO-12

3.0 TESTING

All new trace wire installations shall be located using typical low frequency (512Hz) line tracing equipment, witnessed by the contractor, engineer and facility owner as applicable, prior to acceptance of ownership.

This verification shall be performed upon completion of rough grading and again prior to final acceptance of the project. Continuity testing in lieu of actual line tracing shall not be accepted.

4.0 CONNECTORS

All mainline trace wires must be interconnected in intersections, at mainline tees and mainline crosses. At tees, the three wires shall be joined using a single 3-way lockable connector. Connectors shall be dielectric silicon filled to seal out moisture and corrosion, and shall be installed in a manner so as to prevent any uninsulated wire exposure.
Non-locking friction fit, twist on or taped connectors are prohibited.

5.0 TERMINATION/ACCESS/TEST STATIONS

All trace wire termination points must utilize an approved tracer wire access box, specifically manufactured for this purpose or as detailed on the plans

All grade level/in-ground access boxes shall be appropriately identified with “sewer” or “water” cast into the cap and be color coded (blue – water / green – sewer).

Test stations at dead ends shall be two-terminal.

Test stations in between dead ends shall be single terminal.

A minimum of 2 ft. of excess/slack wire is required in all trace wire access boxes after meeting final elevation.

Grounding anode wire shall be connected to the identified (or bottom) terminal on all access boxes.

Hydrants – Trace wire must terminate at an approved above-ground trace wire access box, properly affixed to the hydrant grade flange.

6.0 GROUNDING

Trace wire must be properly grounded at all dead ends/stubs.

Grounding of trace wire shall be achieved by use of a drive-in magnesium grounding anode rod with a minimum of 20ft of #12 red HDPE insulated copper clad steel wire connected to anode specifically manufactured for this purpose, and buried at the same elevation as the utility.
Where the anode wire will be connected to a trace wire access box, a minimum of 2 ft. of excess/slack wire is required after meeting final elevation.

7.0 SANITARY SEWER SYSTEM

A mainline trace wire must be installed, with all service lateral trace wires properly connected to the mainline trace wire, to ensure full tracing/locating capabilities from a single connection point.

Lay mainline trace wire continuously, by-passing around the outside of manholes/structures on the North or East side.

Trace wire on all sanitary service laterals must terminate at the cleanout and located directly above the service lateral at the edge of road right of way as detailed in the plans.

8.0 WATER SYSTEM

A mainline trace wire must be installed, with all service lateral trace wires properly connected to the mainline trace wire, to ensure full tracing/locating capabilities from a single connection point.

Lay mainline trace wire continuously, by-passing around the outside of valves and fittings on the North or East side.

Trace wire on all water service laterals must terminate at an approved trace wire access box color coded blue and located directly above the service lateral at the edge of road right of way.

Above-ground tracer wire access boxes will be installed on all fire hydrants.

All conductive and non-conductive service lines shall include tracer wire.

9.0 INSTALLATION

Trace wire systems must be installed as a single continuous wire, except where using approved connectors. No looping or coiling of wire is allowed.

Trace wire shall be installed at the bottom half of the pipe and secured (taped/tied) at 5’ intervals.

Trace wire on all service laterals/stubs must terminate directly above the utility, at the edge of the road right-of-way, but out of the roadway.

At all mainline dead-ends, trace wire shall go to ground using an approved connection to a drive-in magnesium grounding anode rod, buried at the same depth as the trace wire.

Mainline trace wire shall not be connected to existing conductive pipes. Treat as a mainline dead-end, ground using an approved waterproof connection to a grounding anode buried at the same depth as the trace wire.

All service lateral trace wires shall be a single wire, connected to the mainline trace wire using a mainline to lateral 3-way connector, installed without cutting/splicing the mainline trace wire.

In occurrences where an existing trace wire is encountered on an existing utility that is being extended or tied into, the new trace wire and existing trace wire shall be connected using approved splice connectors, and shall be properly grounded at the splice location as specified.

Trace wire on all water service laterals must terminate at an approved trace wire access box color coded blue and located directly above the service lateral at the edge of road right of way.

Above-ground tracer wire access boxes will be installed on all fire hydrants.

All conductive and non-conductive service lines shall include tracer wire.

SECTION 33 30 00
SANITARY SEWER

PART 1 - GENERAL

1.01 SECTION INCLUDES

This item shall consist of furnishing all of the necessary materials, supervision, labor, tools, equipment and incidentals, and the installation of various types and sizes of sewer pipe and related items in accordance with the Contract Drawings and Specifications, as stated in the Proposal.

1.02 APPLICABLE PUBLICATIONS

The following publications form a part of these Specifications and where referred to by basic designation only, are applicable to the extent indicated. The latest editions of the publications referenced shall apply to the work.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)

A 139	Electric-Fusion (Arc)-Welded Steel Pipe (NPS 4 and Over)
A 252	Welded and Seamless Steel Pipe Piles
C 31	Making and Curing Concrete Test Specimens in the Field
C 33	Concrete Aggregates
C 39	Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens
D 1248	Polyethylene Plastics Extrusion Materials For Wire and Cable
D 1784	Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds
D 2412	Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading
D 3034	Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.
D 6938	Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
D 3212	Joints for Drain and Sewer Plastic Pipes using Flexible Elastomeric Seals.
F 477	Elastomeric Seals (Gaskets) for Joining Plastic Pipe
F 794	Poly(Vinyl Chloride) (PVC) Profile Gravity Sewer Pipe and Fittings Based on Controlled Inside Diameter

AMERICAN WATER WORKS ASSOCIATION (AWWA)

C 104 Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water

T-191 Density of Soil In-Place by the Sand-Cone Method.

MISSISSIPPI DEPARTMENT OF TRANSPORTATION

Standard Specifications for Road and Bridge Construction, 2004 Edition

1.03 SUBMITTALS

The following submittals shall be required for the respective materials used in the work. All submittals shall be submitted through the Contractor to the Engineer.

A. Ductile Iron Pipe:

The following submittals shall be required for ductile iron pipe systems utilized on the project. The Contractor shall furnish manufacturer's certificates certifying that the pipe and fittings conform to the requirements as specified hereinafter under Part 2, Materials. In addition, the submittals shall include the following:

1. Joints: The following shall be required for ductile iron joints.

    a. Drawings or Manufacturer's catalog data indicating dimensions and tolerance.

    b. Gaskets shall be tested in accordance with the respective standards as indicated in AWWA C111 and results shall be included in the submittals. Test shall be for similar materials on the gaskets and be not more than one year old.

    c. Mechanical Joints: Should the Contractor elect to use mechanical joints in lieu of push-on joints, manufacturer’s data shall be submitted in accordance with the "Special Requirements for the Mechanical Joint" as stated AWWA C 111.

2. Ductile Iron Pipe Submittal Shall Include the Results of:

a. Tension Test

b. Impact Test

c. Low Temperature Impact Test

Sampling procedure shall be as indicated in AWWA C151.

B. PVC Pipe:

The Contractor shall submit manufacturer's certificate certifying that the pipe and fittings conform to the requirements as specified hereinafter under Part 2, Products. In addition, the Contractor shall submit the following:

1. PVC Piping: PVC Pipe shall be sampled, tested, and inspected in accordance with the provisions of ASTM D3034. Copies of test results shall be attached. Test results shall be similar material and not be more than one year old from the date of material delivery.

2. Joints: Certificate with test results for joints for compliance to ASTM D 3212. Gaskets shall conform to ASTM F 477. Test results shall be for similar material and not be more than one year old.

PART 2 - PRODUCTS

2.01 Gravity Sewer Pipe

Where the type of gravity sewer piping is not indicated on the plans, the Contractor shall furnish polyvinyl chloride (PVC) pipe.

The Contractor shall be restricted to furnishing the exact type of pipe material where indicated on the Contract Drawings.

The Contractor shall be limited to the use of only one type of pipe (so selected by the Contractor and indicated on the Proposal Form) and shall not change the type of gravity sewer pipe except as follows:

1. Where indicated on the plans, or

2. If permitted in writing by the Engineer.

A. Ductile Iron Pipe:

1. Ductile iron gravity sewer pipe shall conform to the requirements of AWWA C151 Class 50 for the respective nominal diameter size. Joints shall be push-on or mechanical, both in accordance with AWWA C 111. Fitting shall conform to AWWA C 110 with mechanical or standard push-on joints.

2. All ductile iron pipe and fittings shall be coated outside with standard bituminous coatings and lined inside with a 16 mil coal tar epoxy coating. All fittings are to be absorbed in the price of pipe.

B. PVC Pipe:

1. PVC gravity sewer pipe and fittings shall conform to the requirements of ASTM D 3034 with an SDR of 26 and a minimum stiffness of 115 psi. Joints for sewer pipe shall be either push-on or

mechanical conforming to the requirements of ASTM D 3212. Gaskets for sewer pipe shall conform to the requirements of ASTM F 477.

2. Approved adaptors shall be used for making connections between PVC pipe and concrete manholes.

C. Service Laterals:

1. Service laterals for local services shall consist of fittings, pipe lengths, and plugs for later connection of 6 inch or 4 inch pipe. The fittings, pipe lengths and plugs shall be of the same material as the run pipe unless otherwise indicated on the Contract Drawings. The modified sewer tees shall be an integral part of the run pipe. The remainder of the branch shall consist of standard fittings (elbows, reducers, and lengths of pipe) in accordance with the manufacturer's standard products and as specified. Pipe lengths and joint connections shall meet the specified requirements for the type materials used. Ends shall be plugged and identified with a 2" x 2" treated post.

2. All service lines shall extend a maximum of up to 5 feet from house fronts of residences and public buildings and up to the property lines of businesses.

2.02 Casing Pipe:

Steel pipe utilized as casing at locations shown on the Contract Drawings shall be new round piling pipe conforming to the requirements of ASTM A 252 or A 139. Casing diameter shall be adequate to allow pushing of the specified diameter of sewer pipe or force main and make proper connections at the ends. Minimum Wall Thickness for steel casing is 0.25 inch (Highway) and 0.28 inch (railroad).

2.03 Stabilization Material:

Stabilization Material shall be a pit run mixture of sand and gravel. The sand shall be hard, sharp and durable particles. All gravel shall pass a 1½" sieve.

2.04 Clay Gravel Material:

Clay Gravel Material shall meet MDOT Standards Class 6, Group C.

2.05 Wash Gravel Bedding Material:

Select granular material for pipe bedding shall be coarse concrete aggregate. The coarse concrete aggregate shall conform to the gradation sizing Number 467 specified in Table 2 of ASTM Standard Specification C-33. (See Following Table):

SIZE NO. 467	
Nominal Size (Sieves w/Square Openings)	Percent Passing by Weight
2"	100
1½"	95-100
3/4"	35-70

3/8"	10-30
No.4	0-5

2.06 Concrete:

Concrete shall be in accordance with the requirements of Section 03301, Incidental Concrete.

2.07 Select Backfill:

A. General:

The select material shall be composed of a natural or artificial mixture of sand, silt, clay or soil binder or other material of satisfactory cementing value. The sand shall be hard, sharp, and durable particles, preferably siliceous. The binder shall be a grade of clay or other material having satisfactory cementing qualities and shall be homogenous in character, free from vegetable matter, clay balls or other deleterious substances that cannot be classed as serviceable base material.

B. Gradation:

Any coarse aggregate contained in the material shall pass the one and one-half (1-1/2), sieve and not more than thirty-five percent (35%) shall be retained in the Number 10 sieve. The plasticity index (P.I.) shall not exceed 12 or be less than 5, nor shall the liquid limit exceed 30.

The composite selected sand-clay material passing the Number 10 sieve shall conform to the following minimum and maximum gradation limits:

Sieve	Percent Passing by Weight
Number 40	40-85
Number 60	30-70
Number 270	8-29
Silt (.05 to .005mm)	3-14
Clay (Passing .005mm)	3-14

2.08 Backfill:

All other backfill shall consist of excavated material removed from the trench.

PART 3 - EXECUTION

3.01 EARTHWORK:

A. Site Preparation:

Topsoil shall be stripped and stockpiled in accordance with **Technical Specifications - Restoration of Roads, Driveways, Fences, Lawns, and other Grassed Areas**.

All vegetation such as brush, heavy sod, heavy growth of grass, decayed vegetative matter, rubbish and any other unsuitable material within the area of trenching shall be stripped or otherwise removed before the trenching is started, and in no case shall such objectionable material be allowed in the trench.

Stripping operation shall be to a depth of not less than 6 inches in all cases.

B. Asphalt or Concrete Removal:

Before trenching operations begin, the existing asphalt or concrete pavement shall be scored or cut to a proper depth to give a straight vertical edge when removed. The asphalt or concrete shall be disposed of offsite by the Contractor. While removing the asphalt or concrete in the trench line, never shall the adjacent asphalt be raised or pulled from its base.

C. Trenching:

1. The Contractor shall determine all requirements for trench dimensions, alignment, and grades. The trench shall be excavated in conformance with all federal, state and local regulations for the protection of the workmen. Shoring, sheeting and/or a moveable form shall be used as required to provide earth stability during the laying operations.

2. The final excavation of the trench for the pipe installation shall be as indicated on the Plans. Minor variations in horizontal or vertical alignment during construction shall be made during construction (with the Engineer's approval) to facilitate ease of installation and operation (due to potential conflicts; i.e., utility conflict) at no additional cost to the Owner except for additional piping, if any. The trench from the top of the pipe down to the bottom of the bedding shall be of a consistent width as indicated on the plans. Should the excavated width of the trench be larger than the design width, the Engineer may direct that a higher type or class of bedding be used; or other adjustments be made to increase the load carrying capacity of the pipe.

3. The Contractor shall not excavate more trench in advance of pipe laying than is necessary to perform the work efficiently. No more than 100 feet of open trench shall be allowed unless approved by the Engineer.

4. Excavated material shall be place in a manner that will not obstruct sidewalks, driveways, or other structures. Excavated material shall not be placed so as to surcharge the walls and jeopardize trench stability.

D. Disposal:

1. The Contractor shall satisfactorily dispose of all excess earth from excavations either in approved (by the Engineer) areas within the construction limits or away from the project in disposal sites obtained by the Contractor.

2. The Contractor will be permitted to mound excess earth over the trench to a maximum depth of 12 inches above the original ground surface or finished grade where the trench is located in unimproved property. Wasting of excess excavated material will not be permitted within any road right-of-way. All material within the construction limits shall be placed so that natural drainage is maintained and the surface shall be graded to a smooth and uniform appearance. The disposal of waste and excess excavating materials, including hauling, handling, grading, and surfacing shall be subsidiary obligation of the contractor and no separate payment will be made. Therefore, the cost of such work shall be included in the Contract Unit Price for installation of sewer pipe.

E. Dewatering:

1. The site shall be kept free of surface water at all times. The Contractor shall install drainage ditches and dikes and shall perform all pumping and other work necessary to divert or remove rainfall and other accumulations of surface water from the excavations. The diversion and removal of surface water shall be performed in a manner that will prevent the accumulation of water behind temporary structures or at any other locations within the construction area where it may be detrimental. The Contractor shall provide, install, and operate sufficient trenches, sumps, pumps, hoses, piping, well points, deep wells, etc., necessary to depress and maintain the ground water level at least one foot below the base of the excavation during all stages of construction operations. The ground water table shall be lowered in advance of excavation and maintained a minimum of one foot below the lowest excavation subgrade made until the structure has sufficient strength and weight to withstand horizontal and vertical soil and water pressures.

2. Where groundwater is encountered, the Contractor shall make the effort necessary to secure a dry trench bottom before laying pipe. In sandy soils and in other suitable type soils, dewatering shall be done by well pointing. If, in the opinion of the Engineer, the Contractor has failed to obtain an absolutely dry trench bottom by insufficient use of all known methods of trench dewatering, the Engineer may order the Contractor to excavate below grade and place not less than 6 inches of graded crushed stone fill material over the trench bottom to form trench drains to suitably located sumps and to remove the water by bailing or pumping. The graded crushed stone fill material shall be placed at the Contractor's own expense and shall be of such depth that there shall be not water in bell holes at the time of coupling pipe. All costs of equipment, labor, and materials required for dewatering shall be included in the bid price.

F. Bedding:

1. The Contractor shall satisfactorily shape the trench area (to the specified line, grade and cross section) to receive bedding material. The bottom of the trench shall be undisturbed soil. Should the Contractor over excavate the trench without direction from the Engineer, the trench shall be brought up to grade with select backfill and compacted to at least 90% of maximum laboratory density as measured by AASHTO T 99. Such additional work and materials for over excavation without direction of the Engineer shall be at the expense of the Contractor.

2. Holes for the bells shall be provided at each joint in the subgrade or in the granular fill bedding material as required. The holes shall be no larger than necessary for joint assembly and assurance that the pipe barrel will lie flat on the material. The Contractor shall install the proper bedding for the respective type of pipe and depth of installation as shown in the details and schedules on the plans. When depths vary in a particular manhole run, the Contractor shall change bedding systems in accordance with the depth installation requirements.

3. Stabilization Materials: When the subgrade is found to be unstable or to include ashes, refuse, organic material, or other unsuitable material, the Engineer may direct that the subgrade be over excavated to remove such material. The depths of over excavation shall be as directed by the Engineer. Stabilization material shall be placed into the over excavated area of the trench and shall

be paid for in accordance with these specifications. Stabilization shall be compacted to at least 90% of maximum laboratory density in six inch lifts.

4. Bedding Materials:

   a. As detailed in the plans, bedding material shall be placed to the specified depth below the pipe and tamped to a minimum of 90% of maximum laboratory density as determined in accordance with AASHTO T 99. Following placement of pipe, additional bedding material shall be placed and consolidated under the haunches of the pipe. Special tools shall be required to work the material into place and leave no voids beneath the pipe. The bedding material shall be tamped along the spring line of the pipe to sufficiently compact the material insofar as practical.

   b. The Engineer may direct additional moisture be added to the bedding material to aid in the compaction effort. Mechanical tampers may be employed to aid the process. Depending on the particular bedding required, additional bedding shall be added and tamped to a minimum of 90% of maximum laboratory density, with AASHTO T-99.

5. Select Backfill: Select backfill shall be placed in 6 inch lifts and tamped to a minimum of 95% of laboratory density with AASHTO T-99. Overall depth of the select backfill shall be as directed by the Engineer.

6. Normal Condition Bedding: Under normal conditions the trench bottom shall be undisturbed earth shaped to the specified line, grade, and cross section with proper bell holes at each joint to insure that pipe barrel lies flat on trench bottom. The bedding material will be select native materials excavated from the trench and placed in two lifts. The first lift being placed up to the spring line of the pipe and extending out to the trench walls and hand tamped to a minimum of 90% of maximum laboratory density. Special care shall be used in placing and tamping bedding to ensure no voids under the haunches of the pipe. The second lift shall extend to approximately 6" above pipe (material permitting) and hand tamped to 90% density.

7. Backfilling: Upon completion of placement of select material the excavated materials shall be immediately placed back into the trench. Specific requirements are:

   a. Backfill requirements for road crossings, parking lots, driveways, and sidewalks shall be in accordance with other Technical Specifications.

   b. Backfill requirements for unimproved areas (pastures, wooded areas) shall consist of placement and shaping of the soil in such a manner as to allow maximum natural consolidation. No compaction of the general backfill in the unimproved areas will be required, except that caused by conventional shaping equipment.

   c. No debris shall be used as backfill which has a volume in excess of one-half of one cubic foot or a weight excess of 75 pounds.

8. Sheeting Removal: Wooden sheeting or other thick sheeting or shoring members which have been driven or otherwise placed along the trench walls to an elevation below the spring line of the pipe shall be cut off at the spring line or higher and left in place.

9. Grading and Grassing: Final grading and grassing shall be in accordance with other Technical Specifications.

3.02 PIPE HANDLING AND STORAGE:

Pipe shall be handled, staked, and stored in accordance with manufacturer's printed literature. The Contractor shall provide security as required to prevent damage by vandals. PVC pipe shall be shaded from sunlight if it is left outside for extended lengths of time. Pipe damaged during storage and handling shall be rejected.

3.03 PIPE LAYING:

A. Pipe laying shall proceed upgrade with the spigot ends of the bell-and-spigot pipe and tongue ends of the tongue and groove pipe jointing in the direction of flow. Each pipe shall be laid true to line and grade and in such a manner as to form a close concentric joint with the adjoining pipe and to prevent sudden offsets of the flow line. As the work progresses, the interior of the sewer shall be cleared of all dirt and superfluous materials of every description. Where cleaning after laying is difficult because of small pipe size, a suitable swab or drag shall be kept in the pipe and pulled forward past each joint immediately after the jointing has been completed. Trenches shall be kept free of water and pipe shall not be laid when the condition of the trench or the weather is unsuitable for such work. At times when work is not in progress, open ends of pipe and fittings shall be securely and satisfactorily closed so that no trench water, earth or other substance will enter the pipe or fittings.

B. Pipe laying shall be performed in such a manner that no foreign material enters the pipe. The Engineer may require that before lowering pipe, heavy canvas bags be placed over each end, and left in place until joints are ready to be made. If water is in the trench, the seals shall remain in place until the trench is pumped completely dry. If conditions are unsuitable, no pipe shall be laid until satisfactory laying conditions are obtained in accordance with the above specified requirements.

C. The Contractor shall utilize a commercial grade laser beam specifically manufactured to aid in maintaining grade and alignment of pipelines during installation. The primary unit shall be mounted on a heavy duty base and firmly anchored in the downstream manhole of the reach under construction. The maximum distance shall not exceed four hundred feet (400') per set-up.

D. Each joint of pipe shall be installed using an approved target to align the pipe with the projected laser beam. The methods and procedures shall be in strict accord with the manufacturer's recommendations and instructions. Proper ventilation shall be maintained at all times. Care shall be exercised in order to prevent bumping or misalignment of the projected bean. Sewer lines shall be laid such that the installed variation of invert elevations when compared with the construction plans does not exceed 0.05 feet. Sewer lines in which said variation exceeds 0.05 feet may be rejected. Sewer pipe shall be visually inspected for alignment by lamping, televising or by other appropriate means to determine alignment.

E. Whenever a movable steel box is used in place of sheeting, the Contractor shall take care to prevent the pipe from moving when the steel box is moved.

3.04 PIPE JOINTING:

A. Piping shall be jointed in accordance with the manufacturer's printed recommendations. Gaskets shall be firmly set within the bells and grooves as required. The manufacturer's recommended lubricant or an approved equal shall be applied for slip type joints.

B. PVC Pipe Joint Construction:

1. The bell and spigot ends of PVC sewer pipe shall be cleaned of all foreign material that could interfere with proper assembly of the joints. The spigot ends shall be cleaned one inch (1") beyond the joint assembly reference mark.

2. The spigot end of the pipe shall be thoroughly lubricated in accordance with the manufacturer's recommendations. The coating should be the equivalent of a brush coat of enamel paint and maybe applied by hand, cloth, pad sponge or glove.

3. The lubricated spigot end shall be inserted into the bell keeping the pipe length in proper alignment. The bell shall be braced while the spigot end is pushed in under the rubber ring, so that previously completed joints in the line will not be closed up. The spigot end shall be pushed into the bell until the reference mark is flush with the end of the bell.

4. Generally, the installation and jointing of PVC Pipe shall conform to the requirements of the latest edition of ASTM D-2321, “Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications ".

C. Ductile Iron Pipe Joint Construction:

1. The installation and jointing of ductile iron pipe shall generally conform to the applicable provisions of AWWA Standard Specifications C-600 for pipe laying.

2. Where mechanical joint pipe is used, the surfaces which come in contact with the gasket shall be thoroughly brushed with a wire brush just prior to assembly. The gasket should be brushed with soapy water prior to installation to remove loose dirt and to lubricate gasket as it is forced into its retaining space.

3. When tightening bolts, it is essential that the gland be brought up toward the pipe flange evenly. The bolts should be partially tightened; the bottom bolt first, then the top; next the bolts on either side; and last, the remaining bolts. Overstressing of bolts to compensate for poor installation will not be permitted. Bolt torque shall be in accordance with manufacturer's specifications.

4. All joints of whatever type shall be completely water tight after being subjected to the required tests.

D. Jointing Dissimilar Pipes:

1. Suitable adaptor couplings are required for connecting dissimilar pipes. The couplings shall be approved by the Engineer before installation.

3.05 STREAM CROSSING:

Ductile iron pipe Class 50 shall be used as shown on the Drawings. Granular fill, concrete, and concrete collars shall be placed or constructed as shown on the contract drawings.

3.06 SERVICE LATERALS (LINES):

Modified sewer tees shall be installed on the run pipe at the appropriate field locations. Service lines of the sizes specified shall be laid to a uniform grade so that the customer being served can be tied-in using good construction practices. All tamping and backfilling operations shall be performed the same as on main line pipe. Removable plugs shall be securely installed in pipe ends and a 2" x 2" treated post extending 12" above the ground line shall mark the pipe end location.

3.07 BORINGS:

A. Borings shall be accomplished in accordance with Mississippi Department of Transportation or Railroad Standards. The contractor shall provide all necessary sheeting, bracing, cribbing, supports and appurtenances to insure the proper line and grade throughout the entire length of the crossing.

B. Casing Pipe: Casing Pipe shall be installed as indicated on the Contract Drawings. Joints shall be completely welded to provide structural integrity and shall be water tight.

C. Carrier Pipe: Carrier pipe may be any of the allowed options of piping. However, the piping and joints shall be capable of withstanding the stress exerted by pushing the pipe within the casing.

D. Carrier Pipe Supports: Supports for the carrier pipe shall be as recommended by the manufacturer for such installation. Supports shall be spaced to adequately support the piping under surcharged sewage conditions.

E. Casing Seal: The annulus between the casing and carrier pipe shall be sealed at each end with a quick setting grout.

3.08 RELATION TO WATER MAINS

A. Water mains shall be laid at least 10 feet horizontally and 18 inches vertically from any sanitary sewer or manhole. The bottom of the water line should be at least 18 inches from the top of the sewer line. (Water lines should always be constructed above sewer line. Under extraordinary circumstances, the Division of Water Supply may approve the construction of a sewer line above a water line provided the design engineer meets special construction requirements as determined by the Division.

B. Where local conditions prevent adequate horizontal and vertical separation, the Division of Water Supply may allow the water line to be laid closer to the sewer line if supported by adequate data from the design engineer. Each situation will be reviewed on a case by case basis. A detailed drawing shall be included in the plans for the water line construction submitted to the Division of Water Supply for review an approval.

C. Where adequate horizontal and/or vertical separation cannot be maintained, the following requirements shall apply.

1. If the 10 foot horizontal separation between water and sewer lines cannot be maintained then the water line should be ductile iron with water line joints located at the maximum distance possible from sewer line joints. PVC pipe may be used if it is protected by a steel casing. Also the water and sewer lines must be in separate trenches with adequate space for maintenance. In some cases, special sewer line construction procedures may be required.

2. Where the 10 foot horizontal and 18 inch vertical separation cannot be maintained, condition I must be met and the sewer line shall be constructed according to water main standards.

3.09 TESTING

A. Ductile Iron Pipe:

1. Field Inspection: The Engineer shall perform visual inspection of the material prior to placement by the Contractor. The Engineer may make non-destructive tests to determine the soundness of the pipe. The Contractor shall assist the Engineer in handling and moving the pipe as required.

2. Material Test: Material test shall be conducted during the manufacturing process and the results shall be included as part of the submittals. No other material test shall be required.

B. PVC PIPING:

Material test shall be conducted during the manufacturing process and the results shall be included as part of the submittal. No other material test shall be required.

C. STEEL CASING PIPE:

Material test shall be included as part the submittal. No other material test shall be required.

D. BEDDING MATERIAL AND STABILIZATION MATERIAL:

Test for gradation and test for material passing the No. 40 sieve shall be as follows:

Gradation	- AASHTO T 88
Liquid Limit	- AASHTO T 89
Plasticity Index	- AASHTO T 90

One set of each test listed above will be required for every 500 cubic yards or major fraction thereof.

E. COMPACTION TESTS:

Compaction tests shall be performed in accordance with AASHTO T 191 or ASTM D 2922. Maximum compaction shall be determined in accordance with AASHTO T99. Compaction tests for sewer pipe related work shall not be less than as follows:

	(Number of Compaction Tests)	
	AASHTO T-99	AASHTO T-191or ASTM D 2922
Select Backfill Material OR Stabilization Material	1	One per 100 CY
Bedding Material	2	One per 600 LF
Tamped Backfill	2	One per 600 LF

F. INFILTRATION/EXFILTRATION TEST:

The Contractor shall provide all plugs, water supply, measuring devices, and all other equipment, material, labor and supervision to measure the infiltration and exfiltration tests as specified below. The Contractor shall perform the test in the presence of the Engineer. All gravity sewer pipe shall be tested in accordance with the following applicable requirements.

1. Infiltration Test: The infiltration test shall be conducted between adjacent manholes. The outlet pipe on the downstream manhole shall be plugged and tested for water tightness to the satisfaction of the Engineer. The accumulated depth of water in the downstream manhole shall be read at 12 hour intervals for two (2) days and the infiltration rate calculated from the data obtained. Any section exceeding an infiltration rate of 200 gallons/day/inch diameter/mile shall be relayed at the Contractor's expense. This means that the Contractor shall locate and repair leaks as necessary to pass the infiltration test. Infiltration test shall be utilized only when the ground water level is above the top of the pipe.

2. Exfiltration Test: The exfiltration test shall be conducted between adjacent manholes. The inlet pipes in the downstream and upstream manholes shall be plugged. The line being tested shall be filled with water until water depth becomes two (2) feet above top of pipe being tested in the upstream manhole. The water loss shall be measured in the upstream manhole at 12 hour

intervals for two (2) days and the exfiltration rate calculated from the data obtained. Any section exceeding an exfiltration rate of 200 gallons/day/inch diameter of pipe/mile shall fail the test. The Contractor shall locate and repair leaks as necessary to pass the exfiltration test. A low pressure air test conforming to ASTM F 1417 may be used in lieu of the exfiltration test.

G. DEFLECTION TESTS:

100% of the PVC gravity sewer shall be tested 30 days after the final backfill has been in place by the following method:

Use a "Go-, no-go" mandrel which is sized to such dimensions that it will not "go" when encountering a deflection greater than 5%. The instructions for its use are as follows:

1. Completely flush the line making sure the pipe is clean of any mud or debris that would hinder the passage of the mandrel.

2. During the final flushing of the line, attach a floating block or ball to the end of the mandrel, pull rope and float the rope through the line. (A nylon ski rope is recommended)

3. After the rope is threaded through the line, connect the pull rope to the mandrel and place the mandrel in the entrance of the pipe.

4. Connect a retrieval rope to the back of the mandrel to pull it back if necessary.

5. By hand, remove all the slack in the pull rope and place a tape marker on the top at the end of the pipe where the mandrel will exit, determining the location of the mandrel in the line.

6. By hand, draw mandrel through the sewer lines. If any irregularities or obstructions are encountered in the line, they shall be corrected by the Contractor.

7. If a section with excessive deflection is found, locate it; dig down and uncover the pipe; if any damaged pipe is found, replace it; if pipe is not damaged, replace and thoroughly tamp haunching and initial backfill; replace remainder of backfill.

8. Re-test this section for deflection.

END OF SECTION

SECTION 33 39 13
MANHOLES

PART 1 – GENERAL

1.01 This item shall consist of furnishing all materials, labor, supervision, tools, equipment and incidentals for the construction of standard manholes, in accordance with the Contract Drawings and Specifications. Included in the work are structural excavation, backfill, and disposal of excess material.

1.02 APPLICABLE DOCUMENTS:

The following publications form a part of this specification and where referred to by basic designation only, are applicable to the extent indicated. The latest editions of the publications referenced shall apply to the work.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)

A 48 Gray Iron Casting

C 39 Test for Compressive Strength of Cylindrical Concrete Specimens

C 443 Joints for Circular Concrete Sewer and Culvert Pipe Using Rubber Gaskets

C 478 Precast Reinforced Concrete Manhole Sections

C 497 Standard Methods of Testing Concrete Pipe

C 2922 Density of Soil and Soil Aggregate in Place by the Nuclear Method (Shallow Depths)

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO):

T-99 Moisture Density Relations of Soils Using a 5.5 lb. Rammer and 12-Inch Drop

T-191 Density of Soil In-Place by the Sand-Cone Method.

1.03 SUBMITTALS

The following tests or data shall be submitted to the Engineer from the Contractor for approval prior to incorporation into the work:

A. Certificates: The Contractor shall furnish certificates from supplier certifying the products conform to the required specifications included herein for the following items:

1. Flexible Plastic Gaskets
2. Precast Manhole Bases
3. Precast Manhole Riser Sections
4. Manhole Steps
5. Manhole Frames and Covers (ASTM A 48)

6. Epoxy Grout

B. Catalogue Cuts or Brochures: The Contractor shall also submit catalogue cuts or product brochures providing descriptive data, recommended application and use, and installation procedure for the following items:

1. Manhole Frames and Covers

2. Epoxy Grouts

3. Manhole Steps

PART 2 – MATERIALS

2.01 Manhole Riser Sections: Manhole riser sections shall be precast reinforced sections conforming to ASTM C 478 and as shown on the Contract Drawings.

2.02 Joints: Joints for precast riser sections shall be concrete pipe type flexible plastic gaskets. Joint material shall be preformed conforming the requirements of AASHTO M-198. Installation shall be in accordance with manufacturer's recommendations.

2.03 Concrete Manhole Bases: Concrete manhole bases shall be precast or cast-in-place as follows:

A. Cast-In-Place Manhole Bases and Box Type Bases (if used): Concrete and reinforcing steel shall conform to the requirements of Section 03301, Incidental Concrete.

B. Precast Concrete Bases: Precast concrete bases shall conform to the requirements of ASTM 478 with reinforcing steel (size and spacing as indicated on the plans).

2.04 Manhole Steps: Manhole steps shall be plastic coated corrosion resistant and shall be installed as shown on the Contract Drawings.

2.05 Cement Grout: Cement grout shall be high strength, non-metallic conforming to Corps of Engineers CRD-C-588. The grout shall be V-3 by W. R. Meadows, Inc., Masterflow 713 by Master Builders or equal.

2.06 Manhole Frame and Covers: Manhole frame and covers shall conform to ASTM A 48 as well as to the following requirements.

A. Standard Manhole Cover and Frame - shall be as manufactured by Dews Foundry, Jackson Standard, Model DF-25 (7) or Vulcan Foundry, Model V-1115, 420 Pounds, marked "SEWER", domestic origin, or equal.

B. Water Tight Manhole Cover and Frame - shall be as manufactured by Vulcan Foundry, Model V2357, or Dews Foundry, Model DF-25(7)W.T., 410 pounds with neoprene gasket, four 5/8 inch stainless steel bolts recessed into cover. Cover labeled "SEWER", domestic origin, or approved equal.

2.07 Epoxy Grout: Epoxy Grout shall be high strength non-metallic, non-shrinking. The grout shall be as by EMBECO, Inc., SEAL-COAT or approved equal.

2.08 Drop Manholes: Concrete for drop manholes shall conform to the requirements of Section 03301, Incidental Concrete. Pipe and fittings shall be the same material and size as the incoming gravity sewer.

2.09 Flexible Connection: At all sewer connections to manholes, provide gasket flexible watertight connection that allows for differential settlement of the pipe and manhole wall.

2.10 All manholes: All manholes shall be lined inside with a sixteen (16) mil dry film thickness of an acceptable coal tax epoxy system.

PART 3 – CONSTRUCTION

3.01 EARTHWORK

A. General: Excavation shall be to the extent required to allow proper construction of the manhole. Shoring and sheeting shall be utilized where required by Federal, State and local codes and regulations for safe working conditions. In addition, shoring and sheeting shall be required to protect the integrity of adjacent structures or prevent adverse effects on surrounding areas. Dewatering shall be employed to the extent required to allow dry working conditions.

B. General Excavation: The Contractor shall "lay back" or employ shoring and sheeting as required to assure stability of the excavation. Material shall be stockpiled so as not to surcharge adjoining pipe trenches. Topsoil shall be separated so as to allow the maximum reuse in grassing operations.

C. Structural Excavation: The area immediately beneath the manhole bases shall be graded and compacted. Compaction shall be to 96% of maximum laboratory density as determined by AASHTO T 99. Should unsuitable material be encountered, the Engineer may direct that the area be over excavated and filled with stabilization material. Specification for stabilization material and payment for such shall be in accordance with Technical Specifications.

D. Backfilling: Backfill material shall consist of select backfill in accordance with Technical Specifications. Backfilling shall be uniformly placed around the structure in 10-inch layers and be compacted to 90% of maximum density to full depth in unimproved areas. Backfill in paved areas and within five feet to any edge of pavement shall be compacted to 95% of maximum laboratory density in 8-inch layers to the subgrade line. Refer to Technical Specifications.

E. Salvage: Manhole frames and covers removed during excavation shall remain the property of the Owner and shall be delivered to a location designated by the Owner.

3.02 Riser Installation: Precast concrete riser sections shall be installed plumb and in accordance with the details shown on the Contract Drawings. Joints shall be installed in accordance with manufacturer's recommendations.

The manhole invert channels shall be formed in the bases, smooth and semi-circular in shape conforming to the inside of the adjacent sewer section. Changes in the direction of flow shall be made with a smooth curve of as large a radius as the size of the manhole will permit. Changes in size and grade of the channels shall be formed directly in the concrete of the manhole base. The joint between the base and riser section shall be sealed with epoxy grout. Clean pea gravel shall be used as the epoxy grout filler.

Standard manhole cut-outs and lifting holes shall be sealed with epoxy grout.

3.03 Cast-In-Place Concrete: Bases, flat tops, and drop manhole risers shall be constructed in accordance with Section 03301, Incidental Concrete.

3.04 Manhole Steps: Manhole steps shall be installed during the manufacturing of the riser or cone sections. Risers and cones shall be joined so the steps are vertically aligned.

3.05 Manhole Frame and Covers: Manhole frame and covers shall be set and grouted in place with cement grout. For manholes located in roads or streets, the manhole cover shall be flush with pavement or surface course.

3.06 TESTING

A. General: The Contractor shall conduct (and bear the cost of) all testing (Laboratory Approved by the Owner) as directed by the Engineer and furnish results of such tests prior to incorporating the material into the work. All testing is subsidiary to Manhole Payment Items.

B. Cast-In-Place Concrete Items: The concrete quality testing for manhole bases, drop manholes, and valve boxes shall be tested in accordance with Section 03301, Incidental Concrete.

C. Manhole Risers and Precast Concrete Bases: Manhole risers and precast concrete bases shall be tested for concrete compressive strength. If the place of manufacture is local and reasonably available to the Engineer, Paragraph (a) shall be followed for testing requirements. Should the place of manufacture not be available, Paragraph (b) shall apply.

   The contractor shall prepare (in the presence of the Engineer) standard rodded concrete cylinder or cylinders compacted and cured in a similar manner to the manhole sections. Concrete for such cylinders shall be typical fresh concrete mix drawn from the actual casting operation of a riser or base. Cylinders shall be tested in accordance with ASTM C 39. The average compressive strength shall be equal to or greater than the specified design strength (4000 psi). Not more than 10% of the cylinders shall fall below the design strength (4000 psi). In no case shall any cylinder tested fall below 3200 psi. Number of such cylinder tests shall be as follows:

   1. One set of cylinders for each day's run castings or

   2. One set of cylinders for each 200 linear feet of riser sections manufactured.

   3. One set of cylinders per 20 bases or flat tops manufactured.

   The Engineer may require additional tests should compressive test results fail.

D. Earthwork Test: Maximum laboratory density shall be measured in accordance with AASHTO T-99. Field densities shall be determined in accordance with AASHTO T-191 or ASTM D 2992. Standard proctors and field densities shall be performed in accordance with the following schedule.

1. Standard proctor tests shall be required for earthwork associated with manhole construction. At least two (2) field density tests shall be conducted for earth work associated with each manhole construction.

E. Inspection for Watertightness: All manholes shall be inspected for watertightness prior to placing into service.

END OF TABLE OF CONTENTS

SECTION 02200

EARTHWORK - BUILDINGS ONLY

PART 1 GENERAL

1.1 EXISTING SITE CONDITIONS

A. The Contractor shall visit the site and become familiar with the existing conditions and limitations of the work.

B. All utilities and services, whether shown on the drawings or not, shall be suitably protected and maintained, and any damages thereto shall be promptly repaired. The Owner shall be advised immediately of any damages sustained. If any extra expense is incurred due to the existence of buried utilities not shown on the drawings, or the location of which is not made known to the Contractor, the contract price shall be adjusted in accordance with the General Conditions.

C. The Contractor shall be responsible to raise or lower existing manholes, catch basins, and other existing structures to be compatible with the new earthwork slopes and elevations.

1.2 TESTS

A. All tests shall be made by a laboratory as provided by the Contractor.

B. Standard density tests shall be made as prescribed by ASTM D2922. One test will be required for each lift per 2,500 square foot of surface area in areas under the building. One test per lift will be required where any utility trench comes within the building footprint.

C. For selected fill material the mechanical analysis shall be by ASTM D422. The liquid and plastic limit determination shall be made by ASTM D4318.

1.3 DEFINITIONS

A. Excavation: Cutting, digging and removing all materials of every description, including foundations and rock, and of whatever substance encountered to the dimensions, limits, elevations and contours as shown on the drawings and as herein specified and subsequent disposal of materials removed.

B. Building Area: The term building area is defined as the interior plan area plus an exterior perimeter strip with a minimum width of 5 feet.

PART 2 PRODUCTS

2.1 BORROW

A. The Contractor shall furnish and place suitable material from off-site sources and shall fill and compact as required.

B. Select fill materials shall consist of sandy clays (CL), with a liquid limit less than 45, a plasticity index (PI) in range of 5 to 12. All fill materials shall be free of organic matter and debris.

PART 3 EXECUTION

3.1 DEWATERING

A. The Contractor shall be responsible for all surface drainage, rain, and snow entering the site and building excavation or foundation, and shall remove such water.

B. The Contractor shall keep the area graded at all times to facilitate the runoff of surface waters and maintain a dry working area. Existing earth or fill which becomes too wet from any cause shall be disked or otherwise reworked so as to allow drying and recompaction.

3.2 BUILDING EXCAVATION

A. The building area shall stripped to a sufficient depth to remove any organic laden surficial soils, vegetation, debris, or tree roots . After stripping, any noticeably weak surficial soils shall also be removed as required to expose firm and stable natural soils suitable for proper compaction. After completion of stripping in building areas, the top 12" of existing soils shall be scarified and compacted to not less than 95% of Standard Proctor maximum dry density with stability present. Stability is defined as the absence of significant pumping or yielding under normal dynamic field compaction. Rubber wheeled traffic should be kept to a minimum in the building area, to minimize the potential for pumping soils. Prior to scarifying and compaction efforts at the bottom of the excavated areas, the building area shall be proof-rolled with a loaded dump truck, making two passes over all areas, in the presence of the Owner's representative. Any areas that show signs of weakness, or lack of stability, shall be removed and replaced with select fill.

B. After placing fill, excavate for gradebeams. The bottom of all trenches cut for gradebeams shall be compacted with hand equipment to 98% of Standard Proctor Density.

3.3 FILLING

A. All fills shall be constructed at the locations and to the contours, elevations and sections shown on the drawings.

B. Any unsuitable material within the area upon which fill is to be placed shall be removed. Prepared surfaces on which compacted fill is to be placed shall be wetted or dried as may be required to obtain the compaction specified.

Contractor shall obtain stability on soil prior to placing fill materials. There shall be no significant pumping or yielding of soils under compactive efforts.

C. Fill shall be placed in 9-inch maximum loose lifts at moisture contents within 3 percent of optimum and compacted to not less than 95 percent of standard proctor peak dry density with stability present.

END OF SECTION

SECTION 03100

CONCRETE FORMWORK

PART 1 GENERAL

1.1 DESCRIPTION

A. Concrete formwork shall be in accordance with "Recommended Practice for Concrete Formwork" (ACI 347).

B. Furnish and install all concrete formwork as indicated on the drawings and as specified herein.

1.2 RELATED WORK

A. Patching concrete after form removal, Section 03301 - Cast-in-Place concrete.

PART 2 PRODUCTS

2.1 FORMS

A. Concrete forms shall conform to the shapes, lines and dimensions of the members called for on the drawings. All forms shall be true to line, plumb, level and with joints tight. They shall be properly braced and of sufficient strength to carry the load as a liquid, together with the movements of men and equipment, without appreciable deflection and with absolute safety. Forms shall be designed so that they may be removed in proper sequence. Forms shall be provided for all holes through the floor slabs which may be shown on the structural, mechanical or general drawings.

B. For concrete not exposed to the exterior view but exposed on the interior of the building and below finished grade, use a 3/4" break-off type snap tie with a minimum of 3/4" break-back point.

C. Forms for unexposed concrete shall be sound lumber, plywood or steel.

2.2 MISCELLANEOUS MATERIALS

A. Form coating shall be Creteban 30 form coating as manufactured by Chem-Masters Corporation or equal.

B. Anchor slot shall be felt or cardboard filled dovetailed slot constructed of 24-gauge galvanized sheet metal, as manufactured by Gateway Engineering Company, Chicago, Illinois, or equal.

C. Reglet shall be formed of 26-gauge fiber-filled galvanized sheet metal of such design as not to extend into concrete more than 3/4 inch.

PART 3 EXECUTION

3.1 FORMWORK

A. Design of formwork shall include consideration of the following factors:
   1. Rate and Method of Placing Concrete.
   2. Loads, including live, dead, lateral and impact.
   3. Selection of materials and stresses.
   4. Deflection, Camber, Eccentricity, and Uplift.
   5. Horizontal and Diagonal Shore Bracing.
   6. Shore Splices.
   7. Cross Grain Compression.
   8. Loads on Ground or on Previously-Placed Structure.

B. Forms shall be swept clean before reinforcing is placed. In warm weather, wet down with water before placing concrete.

C. After cleaning forms, coat forms for exposed concrete with form coating in accordance with the coating manufacturer's instructions.

D. Form surfaces shall be smooth and free from irregularities, dents, sags or holes when used for permanently exposed faces.

E. Bolts and rods used for internal ties shall be so arranged that, when the forms are removed, all steel shall be not less than one inch from the concrete surface.

F. Whenever bracing of wall forms is removed, temporary or permanent bracing shall be provided at both top and bottom of all walls to avoid lateral movement.

3.2 MISCELLANEOUS MATERIALS

A. Build-in all anchors, bolts, masonry anchors, reglets, and inserts required.

3.3 REMOVAL OF FORMS

A. No construction loads exceeding the structural design loads shall be supported upon any unshored portion of the structure under construction. No construction load shall be supported upon, nor any shoring removed from, any part of the structure under construction until that portion of the structure has attained sufficient strength to support safely its weight and the loads placed thereon.

B. Where the structure as a whole is adequately supported on shores, the forms for foundation walls after 24 hours, provided that the concrete is sufficiently strong not to be injured thereby.

END OF SECTION

SECTION 03200

CONCRETE REINFORCEMENT

PART 1 GENERAL

1.1 DESCRIPTION

A. Furnish and install all concrete reinforcement as indicated on the drawings and in accordance with ACI Standard 318

1.2 SUBMITTALS

A. Submit shop drawings of bending diagrams and erection plans showing placing for all concrete reinforcement to the Architect for approval. Bar lists submitted without erection plans will be returned without checking.

PART 2 PRODUCTS

2.1 MATERIALS

A. Reinforcing steel shall conform to ASTM A615, Grade 60, for hard-grade steel bars, and shall be as scheduled on the drawings.

B. Wire mesh reinforcing shall be welded steel wire fabric conforming to ASTM A185-79.

C. Accessories: All accessories in slabs and beams such as chairs, screed bases, and slab bolsters shall have upturned legs, either plastic coated or stainless steel.

D. Cut reinforcing steel to lengths and bends as shown on the drawings and as scheduled.

E. Bundles of reinforcing steel shall be identified on stamped metal tags wired to steel.

PART 3 EXECUTION

3.1 ERECTION

A. Deliver all bars bent to conform accurately to details and approved shop drawings. Do not bend bars in a manner that will injure the material. Bend bars cold. Do not use bars with kinks or bends not shown on the drawings.

B. Clean forms of any foreign matter before placing of reinforcing.

C. Before placing, thoroughly clean reinforcing of mill and rust scale and of coatings that will destroy or reduce the bond. Replace any reinforcement appreciably reduced in section. Replace bars with excessive damage, as directed by Architect.

D. Accurately place reinforcement in accordance with the approved shop drawings and hold securely in place during placement of concrete by wires, spacers and chairs. Supports

shall be sufficient in numbers and size to comply with requirements of Concrete Reinforcement Steel Institute or more stringent requirements given on the drawings..

E. Reinforcement protection and clearance shall be in accordance with ACI 318.

END OF SECTION

SECTION 03301

CAST-IN-PLACE CONCRETE

PART 1 GENERAL

1.1 REQUIREMENTS

A. Furnish and install all cast-in-place concrete as indicated on the drawings and as specified herein.

B. "Building Code Requirements for Reinforced Concrete" (ACI 318) and "Specifications for Structural Concrete for Buildings" (ACI 301) is hereby made a part of this section of the specifications except as modified and supplemented herein.

1.2 TESTING

A. All testing shall be performed by a testing laboratory employed by the Contractor.

B. Prepare four 6” diameter or 6 4” diameter test cylinders for each 100 cu. yd. or fraction thereof, of each mix design of concrete placed each day. In the event that concrete from two or more concrete placements are defective and require removal of concrete, from that time forward until 60 days has elapsed without any concrete tests of that particular mix falling more than 300 psi below the 28 day design strength, cylinders shall be taken from every truck delivering the particular mix of concrete, regardless of quantities placed.

C. Conduct a slump test on the first load of each class of concrete delivered each day and at any other time during the progress of the work when requested by the Architect.

Slump exceeding the specified maximum, in two consecutive tests on different portions of the sample, will be cause for rejection of the load.

D. Conduct air meter tests on regular weight concrete in accordance with the procedures outlined in ASTM C231 or in ASTM 173.

Test the first load delivered in the morning and in the afternoon for each segment of the project, when any change in consistency or appearance of the concrete indicates that a test should be made, and at any other time during the progress of the work when requested by the Architect.

E. The following laboratory test shall be conducted by a testing laboratory as outlined in Section 01400, Testing Laboratory Services.

Test each set of concrete cylinders for compressive strength. Test two 4” diameter or one 6” diameter cylinders at 7 days. If cylinder shows evidence of improper sampling, molding, or testing, discard and test an additional cylinder. Test two 6” diameter or 3 4” diameter cylinders at 28 days. If seven-day test did not require use of an additional cylinder, any cylinder at 28 days shows evidence of improper sampling, molding or

testing, test the remaining cylinder. If more than one cylinder in a test shows any of these defects, discard the entire test and investigate the conditions leading to such defects.

Submit the test reports to the Architect, Owner, and Engineer, within 48 hours of performing test.

1.3 EVALUATION OF CONCRETE STRENGTH

A. Concrete cylinders made on this project are for the benefit of the Owner, to determine if the in-place concrete meets the required strengths indicated on the plans and specifications. Any cylinders which fail to meet the 28-day compressive strength required shall be considered to be representative of the in-place concrete. Failure to meet the required strength will be grounds for rejection of the in-place concrete. In the event that the concrete does meet or exceed the required strength, removal and replacement will be required at no additional expense to the Owner. If structural analysis by the Engineer of Record indicates that a lower strength concrete will meet structural and serviceability requirements, concrete falling below strength requirements may be left in place without removal and replacement, if the Owner agrees.

B. If an inadequate number of tests are conducted, the strength of the concrete in place shall be considered questionable and shall be subject to further testing at the expense of the Contractor. If cylinder breaks indicate low concrete strengths, the strength of the concrete shall be considered questionable and shall be subject to further testing at the expense of the Contractor. If ongoing cylinder breaks indicate low concrete strengths, the strength of the concrete shall be considered questionable and further testing as deemed necessary by the Architect may be required and will be at the expense of the Contractor.

C. These additional tests of questionable concrete shall be conducted by an independent testing laboratory approved by the Architect. Cores of in-place concrete may be taken or load tests conducted and results evaluated in accordance with Chapter 2 of ACI 318.

D. Test results obtained by use of an impact hammer or sonoscope will not be considered conclusive in evaluating strengths of concrete.

1.4 TOLERANCES

A. Reinforcement:
   1. Bars shall meet following requirements for fabricating tolerances:
      a. Sheared length: Plus or minus one inch.
      b. Depth of truss bars: Plus 0, minus 1/2- inch.
      c. Overall dimension of stirrups, ties, and spirals: Plus or minus 1/2-inch.
      d. Other bends: Plus or minus one inch.
   2. Bars shall be placed to following tolerances:
      a. Concrete cover to formed surfaces: Plus or minus 1/4-inch.
      b. Minimum spacing between bars: Minus 1/4 inch.
      c. Top bars in slabs and beams:

1) Members eight inches deep or less: Plus or minus 1/4-inch.
2) Members more than eight inches but not over two feet deep: Plus or minus 1/2-inch.
3) Members more than two feet deep: Plus or minus one inch.

d. Crosswise members: Spaced evenly within two inches.
e. Lengthwise of members: Plus or minus two inches.

3. Bars may be moved as necessary to avoid interference with other reinforcing steel, conduits or embedded items. If bars are moved more than one bar diameter or enough to exceed above tolerances, resulting arrangement of bars is subject to approval of the structural Engineer.

B. Concrete:
1. Float and broom finish: Plane within 1/4-inch in 10-feet as determined by a 10-foot straightedge. .
2. Steel trowel finish: Plane within 1/8-inch in 10-feet.
3. Smooth hardened finish: For all rooms with sealed concrete floors.

PART 2 PRODUCTS

2.1 MATERIALS

A. Cement: Portland Cement shall conform to ASTM C- 150, Type I or II. Pozzolan conforming to ASTM C- 595 shall be blended with the Portland Cement in an amount not exceeding 20% of the combined volume.

B. Concrete Aggregates: Shall conform to "Specifications for Concrete Aggregates" (ASTM C- 33), with a maximum size aggregate of 3/4-inch.

Fine aggregate that conforms to Section 703 of the Mississippi Department of Transportation, and is in general use in the area, may be considered satisfactory. The determination of the satisfactory service record of any substituted aggregates shall be at the sole discretion of the Architect. See general notes on plans for further restrictions on aggregate size.

C. Water: from City water main.

D. Air-Entraining Agent: The air-entraining admixture shall be Adz-Air as manufactured by Chem-Masters Corporation, or equal.

E. Retardant: Pozzolith retardant as manufactured by Master Builders, or equal.

F. Expansion Joint Filler: Premoulded, closed-cell polyethylene, equal to Sonoflex Thickness as shown.

G. Storage of Materials: Cement and aggregate shall be stored in such a manner as to prevent their deterioration and the intrusion of foreign matter. Any material which has deteriorated or which has been contaminated will not be used for concrete work.

H. Vapor Barrier: Polyethylene sheet 10 mil thick minimum.

2.2 PROPORTIONING

A. Proportioning shall be by laboratory trial batches or on the basis of previous field experience for the selection of concrete proportions.

B. The Contractor shall establish a design mix to provide concrete of the strengths called for in the plans and specifications.

C. The proportion mix is to be submitted to the Architect for review and approval prior to use on the job.

D. Laboratory cylinders are to be made and compression tests performed , using representative materials supplied by the Contractor's ready-mix concrete company.

E. Control of mixes is to be maintained at the ready- mix plant and on the job and will be reviewed and checked by the above mentioned testing laboratory.

Mixes shall be controlled as follows:

1. The slump on all concretes will not exceed 5 inches.
2. Ready-mix concrete shall be used and shall be mixed and delivered according to the requirements of ASTM C-94. Proportions shall be made by weight and shall be uniformly and accurately controlled by the concrete supplier. Concrete of the correct slump will be delivered to job site. The delivery ticket shall indicate the allowable amount of water that can be added without exceeding water/cement ratios previously established. If water must be added to a load of concrete, it shall only be added by the contractor or the concrete supplier, each of whom assumes responsibility for the load of concrete.

F. After a design mix has been approved by the Architect, there shall be no change made without consent of the Architect in either the cement manufacturer, aggregate supplied, or any admixtures.

G. The proportions of aggregate to cement for any concrete mix shall be such as to produce a mixture which will work readily into corners and angles of the forms and around reinforcement with the method of placing employed on the work, but without permitting the materials to segregate or excess free water to collect on the surface.

H. Concrete of the strength and slump as called for on the plans and in the specifications shall be proportioned according to the American Concrete Institute's Recommended Practice 613 using normal Type I cement supplemented with air-entraining admixtures and set-controlling admixtures.

I. In determining water content for all mixes of concrete, as set forth in the plans, the surface water contained in the aggregates must be included as part of the mixing water in computing the water content. Any and all admixtures shall be proportioned with this factor accounted for in computing mixing water.

J. Rate of Hardening of Concretes: For the climatic conditions and types of construction indicated below, separate mixes shall be designed to produce the required rate of hardening.

Type of Construction	Climatic Conditions	Required Rate of Hardening
Structural Concrete	over 90 degrees F.	Retarded

K. Where controlled setting time and/or rate of hardening is required, the admixture shall be formulated to provide this control without increase in water/cement ratio or loss in strength when compared with normal setting formulation.

L. No other admixtures will be permitted unless specifically approved by the Architect.

M. Calcium chloride or admixtures containing calcium chloride shall not be used.

2.2 SUBMITTALS

Design mix submittals for each type and strength of concrete used.

PART 3 EXECUTION

3.1 CONSTRUCTION JOINTS

A. When stoppage of concreting operation occurs for any reason, place construction joints either horizontally or vertically as needed and as approved by the Architect. All construction joints will be adequately keyed so as to provide a firm tie between the adjacent concrete pour.

B. Concrete shall be allowed to set for 24 hours before an adjoining pour is started.

C. Slabs across the joints shall be level and surfaces shall not be feathered.

3.2 MIXING

A. Delivery tickets shall show class of concrete, batch number, mix by number or sack content with maximum size aggregates, admixtures, air content, slump, and time of loading.

B. Each batch shall be mixed for at least one minute for the first cubic yard and an additional 15 seconds for each additional yard. After all ingredients are in the mixer, then the entire content of the mixing drum shall be discharged before recharging.

C. Addition of water to mix at project site must be noted by testing laboratory, and delivery ticket shall be noted with amount of water, and signed by the party adding the water.

D. Retempering or remixing of concrete which has partially set will not be permitted.

E. Batch mixing on site will not be permitted.

F. Temperature of mixing water shall be a maximum of 55 degrees F. for cold weather concreting and a maximum of 90 degrees F. for concrete placed in hot weather. See paragraph 3.12 of this section.

3.3 PLACING

A. Non-agitating type transportation equipment for delivery to the site shall not be used.

B. Carts or buggies may be used in conjunction with temporary runways if runways do not bear on reinforcing or fresh concrete.

C. Concrete shall be discharged at the job within 1-1/2 hours after water has been added to the cement and aggregates, or cement batched with the aggregates, unless a longer time is specifically authorized by the Architect. During hot weather and under other conditions contributing to quick stiffening of concrete, or when high early-strength cement is being used, Architect may require a reduction in this elapsed time.

D. Deposit in uniform horizontal layers maximum 12 inches deep. Do not drop from conveyor or buggy a distance greater than 5 feet to a point of deposit. For greater heights use chutes.

E. Keep complete record at job of every concrete pour, itemizing date, location, quantity of pour, weather data, and number of test cylinders.

F. Place no concrete before embedded items are in place, nor before forms, reinforcing and affected work of other trades have been examined. Notify Architect and all trades affected as to when concrete will be placed, and allow adequate time for installation of all necessary parts.

G. Concrete shall be thoroughly compacted by means of a mechanical vibrator as approved by the Architect, to provide a dense concrete free of honeycombing, of the dimension and shape as shown on the plans. .

H. All concrete footings, slabs, walks, walls, etc. shall be mechanically vibrated. Vibrator will be selected according to the size of the forms and the spacing between the reinforcing steel.

I. Care shall be taken to see that all reinforcing steel and all formwork is kept a minimum of 3/4" clear of any form, either bottom or side.

J. No concrete shall be deposited when temperature is below 40 degrees F. or when the temperature is forecast to go below 30 degrees F. within the next 12 hours after placing. Whenever the temperature of surrounding areas is below 40 degrees or likely to drop, adequate equipment to provide for heating of concrete materials and for protecting concrete is required. All concrete and cement finishes, when placed, to have a temperature of between 40 degrees and 90 degrees F. and shall be maintained for at

least 72 hours, or for as much time as may be necessary to insure proper rate of curing. No antifreeze chemicals will be permitted.

K. Placing of concrete shall not be started until necessary preparations have been completed and the Architect's approval given. Preparation to consist of completing all formwork, placing of all reinforcing steel, pipes, conduit, hangers, sleeves, anchors, fastening devices, outlets, openings, and such other work that is to be built in and provided for in the section to be poured.

L. It shall be the responsibility of the General Contractor, or concrete sub-contractor, to notify concerned sub-contractors, including the mechanical and electrical sub-contractors, of his intention to pour concrete in the areas involved in sufficient time to allow for the concerned contractors to place necessary and required equipment and/or items of work. He should also notify them when he is going to actually place the concrete, and they shall have representatives on the job as needed to protect their items and accessories.

3.4 EMBEDDED ITEMS

A. Sleeves, conduit and other pipes passing through the floors, walls or beams shall be of such size and in such locations as not to impair significantly the strength of construction. All pipes, sleeves shall be at least equal to Standard Schedule 40 steel pipe and shall be spaced not less than 3 diameters on center.

3.5 FINISHES

A. Structural slab floors inside the building walls shall receive a hard trowel finish. Start troweling when the water has disappeared from the surface to first level the surface. Start final troweling when the concrete has set up to a point where it no longer shows indentations from finger pressure. Trowel to a hard, smooth surface free of marks. Dusting of the slab with cement will not be permitted. Surfaces may vary from a true plane by not more than 1/4" when tested with a 12' straight edge. Either grind or fill surfaces as required to produce a 1/4" tolerance.

B. Floors to receive ceramic tile shall be screeded and floated to an elevation which will allow proper space for setting beds, and the setting bed shall be sloped to the floor drains.

C. Slope floors to drains, where shown.

D. Outside Slabs: Shall be broom finished.

E. Exposed finish: Remove all fins and projections, fill all depressions for a smooth surface. Within 48 hours after form removal, wet concrete surfaces and rub with a Carborundum brick until uniform color and texture are achieved. Do not use a seperate grout mixture.

3.6 CURING AND PROTECTION

A. All concrete and cement finishes are to be maintained in a moist condition for at least the first seven days after placing. This may be accomplished by the application of:
   1. plastic sheeting and daily watering,
   2. burlap mats and daily watering, or
   3. A curing compound compatible with finish flooring products to be used.
   4. Burlene sheets

B. For concreting in hot weather due precautions are to be taken to prevent plastic cracking and premature set. Adequate wind brakes and additional curing water will be provided by the Contractor. When the temperature reaches 75 degrees F. and the relative humidity falls below 50%, additional water should be supplied to the fresh concrete by fogging or ponding. Wind brakes should be erected during the curing time to prevent excessive evaporation due to blowing winds. Normal curing means such as protective paper and/or additional eater should be maintained for a minimum period of five days after casting. Adequate forms may be assumed to constitute curing if watertight. Surface curing compounds and finishes are covered in other sections of this specification. Provisions shall be made by the Contractor for maintaining the concrete in a moist condition for at least five days after placement. All procedures used in hot weather concreting shall be in conformance with ACI Standard "Recommended Practice for Hot Weather Concreting", ACI 605-59.

3.7 PATCHING AFTER REMOVAL OF FORMS

A. After removal of forms, all concrete surfaces shall be inspected, and pressed joints, voids, stone pockets, and holes shall be at once patched before concrete is thoroughly dry.

B. Honeycombed and spalled areas shall be cut out to a depth at which sound concrete is exposed, with edges overcut.

C. Areas to be patched and surrounding concrete for at least 6" shall be wetted.

D. Patching material shall be of the same material and proportions as the concrete to be patched, if exposed to the exterior.

E. Patching material for all interior concrete shall be Embeco Non-Shrink Grout.

F. Patching materials shall use no coarse aggregates unless the patch is of a substantial nature.

G. A minimum amount of water to be used in patching mix.

H. Mortar for patching is to be mixed and allowed to stand and then re-mixed without adding water, and will be worked during the interval to prevent setting. Patching mixture will then be compacted into place. Interior tie holes shall be filled entirely. Patches shall be allowed to shrink for 1 to 2 hours and then finished to match surrounding areas. Patches shall be kept wet for at least 7 days or shall be covered with a prepared curing

compound as approved by the Architect.

I. Grind smooth any surface defects in slabs which will be visible through final floor covering system.

END OF SECTION

SECTION 05120

STRUCTURAL STEEL

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Furnish and install all structural steel items as indicated on the drawings and as specified herein. Extent of structural steel work is shown on drawings, including notes and details to show size and location of members, typical connections, and type of steel required.

B. Structural steel is that work defined in AISC "Code of Standard Practice" and as otherwise shown on drawings.

C. Miscellaneous Metal Fabrications are specified elsewhere in Division 5.

1.2 REFERENCES

A. AISC "Code of Standard Practice for Steel Buildings and Bridges".

B. AISC "Specifications for the Design, Fabrication, and Erection of Structural Steel for Buildings", including the "Commentary" and Supplements thereto as issued.

C. AISC "Specifications for Structural Joints using ASTM A 325 or A 490 Bolts" approved by the Research Council on Riveted and Bolted Structural Joints of the Engineering Foundation.

D. AWS D1.1 "Structural Welding Code".

E. ASTM A 6 "General Requirements for Delivery of Rolled Steel Plates, Shapes, Sheet Piling and Bars for Structural Use".

1.3 PERFORMANCE REQUIREMENTS

A. Steel fabrication and erection shall be done in compliance with AISC code.

1.4 QUALITY ASSURANCE

A. All structural steel shall be checked by Architect's representative.

B. Provide certification that welders to be employed in work are AWS certified. Conduct inspections and tests as required. Record types and locations of defects found in work. Record work required and performed to correct deficiencies. Inspect and test during erection of structural steel for compliance with AWS D1.1.

C. Correct deficiencies in structural steel work which inspections and laboratory test reports have indicated to be not in compliance with requirements. Perform additional tests, at Contractor's expense, as may be necessary to reconfirm any non-compliance of original work, and as may be necessary to show compliance of corrected work.

1.5 SUBMITTALS

A. Shop Drawings: Submit shop drawings including complete details and schedules for fabrication and assembly of structural steel members procedures and diagrams.

1. Include details of cuts, connections, camber, holes, and other pertinent data. Indicate welds by standard AWS symbols, and show size, length, and type of each weld.

2. Provide setting drawings, templates, and directions for installation of anchor bolts and other anchorages to be installed by others.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store materials in a location and manner to keep mud, oil, and rust from contaminating product.

B. Deliver anchor bolts and anchorage devices, which are to be embedded in cast-in-place concrete in ample time to not delay that work.

C. Store materials to permit easy access for inspection and identification. Keep steel members off ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from erosion and deterioration.

D. Do not store materials on structure in a manner that might cause distortion or damage to members or supporting structures.

PART 2 PRODUCTS

2.1 MATERIALS

A. High-Strength Low-Alloy Steel: ASTM A 242 or ASTM A 588.

B. Structural Steel Shapes, Plates and Bars: ASTM A 36, ASTM A992 for all wide flange beams and columns.

C. Cold-Formed Steel Tubing: ASTM A 500, Grade B.

D. Hot-Formed Steel Tubing: ASTM A 501.

E. Steel Pipe: ASTM A 53, Type E or S, Grade B.

F. Anchor Bolts: ASTM A 307, nonheaded type unless otherwise indicated.

G. Unfinished Threaded Fasteners: ASTM A 307, Grade A, regular low- carbon steel bolts and nuts. Provide hexagonal heads and nuts for all connections.

H. High-Strength Threaded Fasteners: Heavy hexagon structural bolts, heavy hexagon nuts, and hardened washers, as follows:
   1. For high-strength low-alloy steel, provide Type 3 fasteners of similar composition as members to be connected.

   2. For high-strength low-alloy steel, provide electrodes, welding rods and filler metals equal in strength and compatible in appearance with parent metal joined.

I. Structural Steel Primer Paint: Fabricator's standard rust-inhibiting primer, gray in color. **Do not paint any surfaces which will receive a sprayed-on fireproofing coating.**

J. Non-Metallic Shrinkage-Resistant Grout: Corps of Engineers CRD-C588, Type M, pre-mixed factory- packaged aggregate grouting compound.

2.2 FABRICATION

A. Shop Fabrication and Assembly: Fabricate and assemble structural assemblies in shop to greatest extent possible. Fabricate items of structural steel in accordance with AISC Specifications and as indicated on final shop drawings

2.3 FINISHES

A. Solvent clean prior to other cleaning to remove any oil or grease.

B. Hand clean with wire brushes or equal to remove all loose scale and paint.

C. Shop paint structural steel, except those members or portions of members to be embedded in concrete or mortar. Paint embedded steel which is partially exposed on exposed portions and initial 2" of embedded areas only. Any structural steel to receive a sprayed-on fireproofing coating shall not be painted.

D. Metal Surfaces, General: For fabrication of work which will be exposed to view, use only materials which are smooth and free of surface blemishes including pitting, seam marks, roller marks, rolled trade names and roughness. Remove such blemishes by grinding, or by welding and grinding, prior to cleaning, treating and application of surface finishes.

PART 3 EXECUTION

3.1 EXAMINATION

A. Visually determine that Project is ready to begin the work of this Section; beginning of work indicates acceptance of conditions. Notify Architect in writing of conditions detrimental to proper and timely completion of work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Architect.

3.2 PREPARATION

A. Furnish templates and other devices as necessary for presetting bolts and other anchors to accurate locations.

B. Setting Bases and Bearing Plates: Clean concrete and masonry bearing surfaces of bond-reducing materials and roughen to improve bond to surfaces. Clean bottom surface of base and bearing plates.

3.3 INSTALLATION

A. Anchor Bolts: Furnish anchor bolts and other connectors required for securing structural steel to foundations and other in-place work.

B. Set loose and attached base plates and bearing plates for structural members on wedges or other adjusting devices.

C. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims, but if protruding, cut off flush with edge of base or bearing plate prior to packing with grout.

D. Pack grout solidly between bearing surfaces and bases or plates to ensure that no voids remain. Finish exposed surfaces, protect installed materials, and allow to cure.

E. Field Assembly: Set structural frames accurately to lines and elevations indicated. Align and adjust various members forming a part of a complete frame or structure before permanently fastening. Clean bearing surfaces and other surfaces which will be in permanent contact before assembly. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.

F. High-Strength Bolted Construction: Install high- strength threaded fasteners in accordance with AISC "Specifications for Structural Joints using ASTM A 325 or A 490 Bolts" (RCRBSJ).

G. Welded Construction: Comply with AWS Code for procedures, appearance and

quality of welds, and methods used in correcting welding work.

3.4 TOLERANCES

A. Will be as per AISC recommendations.

3.5 ADJUSTING

A. Adjust members as necessary to be compatible with final product. Notify Architect before substantially altering any member.

3.6 CLEANING

A. Touch-Up Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint. Apply paint to exposed areas using same material as used for shop painting.

END OF SECTION

SECTION 05210

STEEL JOISTS AND TRUSSES

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Furnish and install steel joists as shown on the drawings and accessories & bridging specified herein which is required by the Steel Joist Institute..

1.2 REFERENCES

A. Steel Joist Institute (SJI) "Standard Specifications, Load Tables and Weight Tables".

B. AWS D1.1 "Structural Welding Code".

1.3 PERFORMANCE REQUIREMENTS

A. Steel fabrication and erection shall be done in compliance with SJI specifications.

1.4 QUALITY ASSURANCE

A. All structural steel shall be checked by Architect's representative.

B. Provide certification that welders to be employed in work are AWS certified. Conduct inspections and tests as required. Record types and locations of defects found in work. Record work required and performed to correct deficiencies. Inspect and test during erection of structural steel for compliance with AWS D1.1.

C. Correct deficiencies in structural steel work which inspections and laboratory test reports have indicated to be not in compliance with requirements. Perform additional tests, at Contractor's expense, as may be necessary to reconfirm any non-compliance of original work, and as may be necessary to show compliance of corrected work.

D. Provide joists fabricated in compliance with the following, and as herein specified.
   1. Steel Joist Institute (SJI) "Standard Specifications, Load Tables and Weight Tables".

1.5 SUBMITTALS

A. Product Data: Submit manufacturer's specifications and installation instructions for each type of joist and accessories. Include manufacturer's certification that joists comply with SJI "Specifications".

B. Shop Drawings: Submit detailed drawings showing layout of joist units, special

connections, jointing and accessories. Include mark, number, type, location and spacing of joists and bridging.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store materials in a location and manner to keep mud, oil, and rust from contaminating product.

B. Store materials to permit easy access for inspection and identification. Keep steel members off ground, using pallets, platforms, or other supports.

C. Deliver, store and handle steel joists as recommended in SJI "Specifications". Handle and store joists in a manner to avoid deforming members and to avoid excessive stresses.

PART 2 PRODUCTS

2.1 MATERIALS

A. Steel: Comply with SJI "Specifications".

B. Steel Prime Paint: Comply with SJI "Specifications", except asphalt type paint not permitted.

2.2 FABRICATION

A. General: Fabricate steel joists in accordance with SJI "Specifications".

B. Extended Ends: Provide extended ends on joists complying with manufacturer's standards and requirements of applicable SJI "Specifications" and load tables.

C. Ceiling Extensions: Provide ceiling extensions in areas having ceilings attached directly to joist bottom chord. Provide either an extended bottom chord element or a separate unit, to suit manufacturer's standards, of sufficient strength to support ceiling construction. Extend ends to within 1/2" of finished wall surface unless otherwise indicated.

D. Bridging: Provide horizontal or diagonal type bridging for "open web" joists, complying with SJI "Specifications".

2.2 FINISHES

A. Apply one shop coat of primer paint to steel joists and accessories, by spray, dipping, or other method to provide a continuous dry paint film thickness of not less than 0.50 mil. **Do not paint any joists which will receive a sprayed-on fireproofing coating.**

PART 3 EXECUTION

3.1 EXAMINATION

A. Visually determine that Project is ready to begin the work of this Section; beginning of work indicates acceptance of conditions. Notify Architect in writing of conditions detrimental to proper and timely completion of work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Architect.

3.2 INSTALLATION

A. Place and secure steel joists in accordance with SJI "Specifications", final shop drawings, and as herein specified.

B. Placing Joists: Do not start placement of steel joists until supporting work is in place and secured. Place joists on supporting work, adjust and align in accurate locations and spacing before permanently fastening.

C. Bridging: Install bridging simultaneously with joist erection, before construction loads are applied. Anchor ends of bridging lines at top and bottom chords where terminating at walls or beams.

D. Field weld joists to supporting steel framework in accordance with SJI "Specifications" for type of joists used. Coordinate welding sequence and procedure with placing of joists.

3.4 TOLERANCES

A. Will be as per SJI recommendations.

3.5 ADJUSTING

A. Adjust members as necessary to be compatible with final product. Notify Architect before substantially altering any member.

3.6 CLEANING

A. Touch-Up Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint. Apply paint to exposed areas using same material as used for shop painting.

END OF SECTION

SECTION 05300

METAL DECKING

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Furnish all materials, equipment and labor for installation of metal decking, accessories and miscellaneous items that may be required, as specified herein or indicated on drawings.

1.2 REFERENCES

A. AWS D1.1 "Structural Welding Code".

1.3 QUALITY ASSURANCE

A. All decking steel shall be checked by Architect's representative.

B. Provide certification that welders to be employed in work are AWS certified. Conduct inspections and tests as required. Record types and locations of defects found in work. Record work required and performed to correct deficiencies. Inspect and test during erection of structural steel for compliance with AWS D1.1.

C. Correct deficiencies in structural steel work which inspections and laboratory test reports have indicated to be not in compliance with requirements. Perform additional tests, at Contractor's expense, as may be necessary to reconfirm any non-compliance of original work, and as may be necessary to show compliance of corrected work.

1.4 SUBMITTALS

A. Submit shop drawings of metal decking showing erection layout and details for each building area for Architect's approval.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store materials in a location and manner to keep mud, oil, and rust from contaminating product.

B. Store materials to permit easy access for inspection and identification. Keep steel members off ground, using pallets, platforms, or other supports.

PART 2 PRODUCTS

2.1 MATERIALS

A. Decking shall be galvanized to comply with ASTM A525 and shall be equal to Vulcraft types as noted on the drawings.

2.2 FINISHES

A. All decking shall be galvanized.

PART 3 EXECUTION

3.1 EXAMINATION

A. Visually determine that Project is ready to begin the work of this Section; beginning of work indicates acceptance of conditions. Notify Architect in writing of conditions detrimental to proper and timely completion of work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Architect.

3.2 INSTALLATION

A. The steel deck shall be placed in accordance with erection drawings. Each unit shall be placed on supporting steel framework and adjusted to final position before being permanently fastened. The unit shall be brought to proper bearing on the supporting members.

B. End laps shall be a minimum of 2" and side laps shall be one-half flute. Attach sheets to steel support by puddle welding or screwing through deck. Attachment spacing shall be 12” on center on each supporting member.

3.3 ADJUSTING

A. Adjust members as necessary to be compatible with final product. Notify Architect before substantially altering any member.

3.4 CLEANING

A. Clean underside of deck to remove any dirt, dust, oil, or other material.

END OF SECTION

SECTION 13122 – METAL BUILDING SYSTEMS

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Clear span rigid frame, flush wall frame as shown – see drawings.

B. Eave heights are shown on building sections.

C. Bay spacing as shown on drawings.

D. Roof Slope: As shown on drawings.

E. Primary Framing: Rigid frame, flush wall frame consisting of rafter beams and columns, end wall columns and wind beams. See drawings.

F. Secondary Framing: Roof purlins, eave struts, flange bracing, and other items detailed.

G. Lateral Bracing: Horizontal loads not resisted by main frame action shall be resisted by portal frames and/or x-bracing in the end walls, sidewalls and roof. See the structural drawings for types and locations of bracing.

H. Wall and Roof System: Preformed steel panels, blanket insulation, and accessory components.

I. Accessories: Metal Doors, Metal Windows, Louvers, rake/eave extensions and canopies, soffit panels, etc as specified herein or as shown on drawings.

1.2 RELATED SECTIONS

A. Section 02201: Earthwork.

B. Section 03100: Concrete formwork.

C. Section 03200: Concrete Reinforcement.

D. Section 03301: Cast-In-Place Concrete.

E. Section 07900: Joint Sealants.

F. Section 08100: Metal Doors and Frames.

G. Section 08400: Storefront Frames.

H. Section 09900: Painting.

1.4 DESIGN REQUIREMENTS

A. The building shall be designed by the Manufacturer as a complete system. Members and connections not indicated on the drawings shall be the responsibility of the Manufacturer and/or Contractor. All components of the system shall be supplied or specified by the same manufacturer.

B. Design Code:
Design load application shall be in accordance with IBC 2012 Edition.

C. Dead Loads:
The dead load shall be the weight of the Metal Building System and as determined by the system manufacturer.

D. Collateral Loads:
The collateral load shall be 5 psf. See structural drawings for drift limitation.

E. Live Loads:
The building system shall be capable of supporting a minimum uniform live load of 20 psf., reducible for frames per IBC.

F. Snow Loads:
The design ground snow loads shall be 5 psf .

G. Wind Loads:
The ultimate wind speed for the metal building system shall be 131 mph.

H. Seismic Loads:
Seismic load shall be determined based upon IBC 2012.

I. Rainfall Intensity: per IBC requirements.
All exterior gutters and downspouts shall be designed for rainfall intensity based upon a 5-year recurrence interval for a five-minute duration.

J. Deflections shall be limited as follows:

Primary Framing:
L/180 for dead load + live load..

Secondary Framing:
L/240 for roof dead load + roof live load; but not less than that required to maintain positive drainage for the greater of roof dead load + roof snow load .
L/240 for wind load on roof.
L/240 for roof snow load (but not less than 20 PSF) on sheeting.

K. Thermal Effects:
Standing Seam roof panels shall be free to move in response to the expansion and contraction forces resulting from a temperature variation. Assembly to permit movement of components without buckling, failure of joint seals, undue stress on fasteners or other detrimental effects, when subject to temperature range of 120 degrees.

1.5 SUBMITTALS

Note: All manufacturer drawings and design calculations shall bear the professional seal and signature of a licensed professional engineer registered in the state of Mississippi.

A. Submit anchor bolt placement plan, and column reactions in advance of erection drawings.

B. Product Data: Provide data on profiles, component dimensions, fasteners, and color selection.

C. Manufacturer's Installation Instructions: Indicate preparation requirements and assembly sequence.

D. Shop or Erection Drawings: Indicate assembly dimensions, locations of structural members, connections, attachments, openings, cambers, and loads; wall and roof system dimensions, panel layout, general construction details, anchorages and method of anchorage and installation; framing anchor bolt settings, sizes, and locations from datum, and foundation

loads; indicate field welded connections with AWS A2.4 welding symbols; indicate net weld lengths.

E. Grid numbers or letters used on shop drawings shall not repeat those shown on contract documents unless they are in the same position as those shown on contract documents. Use of numbers such as 1.1, or letters such as A.2 is acceptable. Failure to follow these provisions is basis for rejection of shop drawings.

1.6 QUALITY ASSURANCE

A. Fabricate structural steel members in accordance with MBMA Metal Building Systems Manual, and, for items not covered, AISC - Specification for Structural Steel Buildings.

1.7 QUALIFICATIONS

A. Manufacturer: The company manufacturing the products specified in this Section shall have a minimum of 10 years experience in the manufacture of steel building systems. The manufacturing company shall be certified under the American Institute of Steel Construction's Category MB Certification Program.

B. Structural framing and covering shall be the design of a licensed Professional Engineer experienced in design of this work.

C. Erector shall have specialized experience in the erection of steel building systems for a period of at least 10 years.

1.8 WARRANTY

A. Building manufacturer shall provide manufacturer's standard material warranty.

B. Manufacturer's guarantee: Twenty (20) year unlimited guarantee for water tightness covering material and workmanship on entire system.

C. Manufacturer's guarantee: Twenty (20) year guarantee against blistering, peeling, cracking, chipping or rust through with a maximum fade of 5 NBS and minimum chalk rating of #8.

D. Contractor's guarantee: Written guarantee agreeing to keep the roof free of leaks for a period of two (2) years beginning at the time of acceptance of the project by the Owner."

1.9 ADMINISTRATION

A. All nomenclature shall conform to the MBMA Metal Building Systems Manual.

B. Coordination and administration of the work shall be in accordance with the MBMA Metal Building Systems Manual – Common Industry Practices.

PART 2 - PRODUCTS

2.1 MATERIALS - ROOF SYSTEM

A. Roof Panels:

1. Equal to MBCI 16” BattenLok HS system with striations, 24 gage or thicker, steel.

2. Panel Finish – Exterior: Precoated steel of silicone polyester finish, color as selected by Architecture from Manufacture’s standard colors. Equal to MBCI Signature 200.

3. Panel Finish – Interior: Precoated steel with wash coat of polyester, manufacturer’s standard finish.

4. Length: Maximum possible to eliminate end splices.

5. Closures: Manufacturer’s standard type, closed cell or metal.

6. Fasteners: Manufacturer’s standard type. Size and design to maintain load and weather tightness requirements. Fasteners to be stainless steel, head and shank self drilling and tapping.

7. Accessories: Provide vented ridge cap, flashing connected to roofing or accessories, flashing support angles and frames, closures, curbs, clips, fasteners and other necessary devices as required to ensure a weather/water tight seal. Material shall be compatible and shall not cause a corrosive condition. Exposed fasteners shall be fitted with weather-seal washers of synthetic rubber (EPDM) with stainless steel unless otherwise indicated.

a. Gutters and trim in connection with metal roofing shall have a siliconized polyester finish, of manufacturer's standard color selected, on exterior face as selected by Architect.

b. Gutters shall have inside finish of factory applied polyester with a coating resistant to weathering, and shall have soldered outlet tubes for connection of downspouts included elsewhere.

c. Curbs shall be seamed-in-place type.

d. Sealants: As recommended by the manufacturer for each condition requiring sealant for watertight installation."

e. Clips shall be compatible with thermal blocks and thermal insulation.

f. Ridge Venting: Where shown, provide ridge vent (low profile) ridge flashing by same manufacturer as roof.

g. All flashing, trim, etc. to be same finish as roof. Architect to select color from manufacturer standard.

B. Soffit Panels:

1. Equal to MBCI Commercial/Industrial "R" panels.

2. Guage: 26 Guage

3. Panel Finish: Precoated steel of silicone polyester finish, color as selected by Architecture from Manufacture's standard colors. Equal to MBCI Signature 200.

C. Color Coordination: Roof and Soffit panel to be by same manufacture to match finish and color.

2.2 MATERIALS – WALL PANELS

A. Vertical Wall Panels:

1. Equal to MBCI Commercial/Industrial "PBC" panels.

2. Guage: 26 gauge

3. Panel Finish: Galvalume Plus (Standard Interior Finish)

4. Accessories: Install as recommended by panel manufacture including all required trim and accessories with finish to match panel.

B. Horizontal Wall Panels:

1. Equal to MBCI Commercial/Industrial “7.2” panels.

2. Guage: 26 Guage

3. Panel Finish - Exterior: Precoated steel of silicone polyester finish, color as selected by Architecture from Manufacture’s standard colors. Equal to MBCI Signature 200.

4. Accessories: Install as recommended by panel manufacturer including all required trim and accessories with finish to match panel.

2.2 MATERIALS - TRIM

A. Fascia, Flashings, Internal and External Corners, Closure Pieces, Infillsand caps: Same material and finish as adjacent material, profile to suit system. Color as selected by Architect from manufacturer's standards.

2.3 FABRICATION - PRIMARY FRAMING

A. Framing Members: Clean and prepare in accordance with SSPC-SP2 as a minimum, and coat with building manufacturer's standard primer.

B. Hot rolled members shall be fabricated in accordance with AISC Specification for pipe, tube, and rolled structural shapes and primed.

C. Fabricate built-up members in accordance with MBMA Metal Building Systems Manual, Common Industry Practices.

2.4 FABRICATION - SECONDARY

A. Framing Members: Clean and prepare in accordance with SSPC-SP2, as a minimum, and coat with building manufacturer's standard primer.

B. Cold Formed Members: Cold formed structural shapes shall be fabricated in accordance with MBMA Metal Building Systems Manual, Common Industry Practices.

C. The purlin spacing for the building shall be adjusted as necessary to provide adequate support for the roof decking at differing code dictated zones in the plane of the roof. Calculations submitted shall include the basis for the purlin spacing submitted for approval.

2.5 FABRICATION - GUTTERS, DOWNSPOUTS, FLASHINGS AND TRIM

A. Fabricate gutters, flashings and trims from manufacturer's standard. Color to be selected by Architect from manufacturer's standard offering.

B. Fabricate or furnish downspouts with elbows from manufacturer's standard. Color to be selected by Architect from manufacturer's standard offering.

C. Form gutters and downspouts of profile and size to collect and remove water. Fabricate with connection pieces.

D. Form flashing and trim sections in maximum possible lengths. Hem exposed edges. Allow for expansion at joints.

E. Fabricate or furnish gutter support straps of manufacturer's standard material, design and finish.

F. Fabricate or furnish downspout clips or support straps of manufacturer's standard material. Finish color as selected by Architect.

2.6 THERMAL INSULATION

A. Insulation: Provide glass fiber blanket insulation not less than 0.5 lb. per cubic foot density, 6” thickness with UL flamespread classification of 25 or less, and 2” wide continuous vapor tight edge tabs. R value to be R-19 in place. Provide thermal blocks.

B. Vapor Barrier: Vinyl film.

C. Retainer Strips: Provide 26 ga. formed galvanized steel retainer clips colored to match insulation facing.

D. Location: Locate insulation on underside of roof sheets, extending across top flange of purlin members and held taut and snug to roofing panels by retainer strips.

PART 3 - EXECUTION

3.1 EXECUTION

A. Verify site conditions.

B. Verify that foundation, floor slab, mechanical and electrical utilities, and placed anchors are in correct position and properly squared.

C. Provide access to the work as scheduled for owner provided inspections, if required. The cost of any required inspections is the responsibility of the owner.

D. Do not proceed until unsatisfactory conditions have been corrected.

3.2 ERECTION - FRAMING

A. Erect framing in accordance with MBMA Metal Building Systems Manual, Common Industry Practices.

B. Use templates for accurate setting of anchor bolts. Level bearing plate area with steel wedges or shims, and grout. Check all previously placed anchorages.

C. Erect building frame true and level with vertical members plumb and bracing properly installed. Maintain structural stability of frame during erection.

D. Ream holes requiring enlargement to admit bolts. Burned holes for bolted connections are not permitted without written approval by designer. Burned holes to be reamed.

E. Tighten bolts and nuts in accordance with "Specification for structural joints using ASTM A325 or A490 bolts" using specified procedure. Calibrated wrench tightening or direct tension indicator washers may be used to assure correct tightening.

F. The erector shall furnish temporary guys and bracing where needed for squaring, plumbing, and securing the structural framing against loads, such as wind loads acting on the exposed framing and seismic forces, as well as loads due to erection and erection operation, but not including loads resulting from the performance of work by others. Bracing furnished by the manufacturer for the metal building system cannot be assumed to be adequate during erection and are not to be used to pull frames into plumb condition. The temporary guys, braces, falseworks and cribbing

are the property of the erector, and the erector shall remove them immediately upon completion of erection.

G. Do not field cut or modify structural members without approval of the metal building manufacturer.

H. After erection, erector to prime welds, abrasions, and surfaces not shop primed, galvanized, or needing touch-up.

3.3 ERECTION - WALL AND ROOFING SYSTEMS

A. Install all wall and roofing systems in accordance with manufacturer's instructions and details.

B. Exercise care when cutting prefinished material to ensure cuttings do not remain on finish surface.

C. Fasten cladding system to structural supports, using proper fasteners aligned level and plumb.

D. Set purlins and girts at right angle and bolt to appropriate clips. Attach to clips as required to satisfy design loads and as shown on drawings.

E. Place screw down roof panels at right angle to purlins and girts. Attach and plumb wall panels as shown on drawings. Maintain consistent module coverage for entire length of wall. Predrill panels. Lap panel ends as recommended by manufacturer. Place end laps over purlins or girts. Apply butyl roof panel side and end lap sealant between panel ends and side laps to provide water-tight installation per details furnished.

F. Place Standing Seam Roof panels at right angle to purlins. Attach with sliding concealed clip where expansion and contraction must be accounted for. Lap panel ends as recommended by manufacturer. Place end laps above purlin with backup plate and cinch strap so panel end-lap fasteners do not penetrate purlin.

3.4 ERECTION - GUTTER, DOWNSPOUT, FLASHINGS AND TRIM

A. Install gutters and downspouts, flashings and trim in strict accordance with manufacturer's instructions, using proper sheet metal procedures.

B. The downspout to be connected to cast iron down spouts by general contractor and to storm sewer system by plumbing contractor.

3.5 INSTALLATION - ACCESSORIES

A. Install accessories in accordance with manufacturer's instructions.

B. All roof and wall accessories to be installed weathertight.

3.6 TOLERANCES

A. All work shall be performed by experienced workmen in a workmanlike manner to published tolerances.

B. Install Framing in accordance with MBMA Metal Building Systems Manual, Common Industry Practices.

3.7 INSPECTION

A. Installer of metal roofing must examine substrate and conditions under which roofing work is to be performed and must notify Contractor in writing of unsatisfactory conditions. Do not proceed with roofing work until unsatisfactory conditions have been corrected in manner acceptable to the installer.

3.8 INSTALLATION

A. General: Comply with instructions and recommendation of the metal roofing manufacturer, except to extent more stringent requirements are indicated. Secure as required for UL Class 90 Wind Uplift Classification.

B. Place roof panels, if possible, in full length pieces without splicing. Secure each panel to each support by means of a steel clip concealed between the adjacent male and female interlocking ribs and fastened to the panel's weather surface.

1. Endlaps, when required, shall be at least 6 inches, sealed with recommended sealants and fastened together by clamping plates.

C. Install edge trim, gutters and gutter supports in accordance with approved shop drawings and manufacturer's recommendations.

D. Penetrations through the roof panels by fasteners shall be limited to only those required at penetrations, eaves, endlaps, hips, valleys and ridge.

E. Make panel-to-panel connections with a positive, field-formed double lock standing seam, rolled 180 degrees by a special seaming device.

F. Make panel-to-panel connections by field seaming with a seaming device, and shall include factory applied side lap sealant.

G. Properly flash and seal at ends, ridges, hips, valleys, penetrations, and eaves to assure water tightness.

H. Seal all joints where water might penetrate to interior of building, including ridge and hip covers, roof flashings and curbs, ridge and hip channels, exposed joints of roof accessory openings, end laps, eave and edge flashing, and other locations required.

I. Thermal Insulation: Install insulation in accordance with manufacturer's published directions and concurrently with installation of panels. Install blankets straight and true in one-piece lengths with both sets of tabs sealed to provide a complete vapor barrier. Install retainer strips at each longitudinal joint, straight and taut, nesting with roof rib to hold insulation in place.

3.9 CLEANING:

A. Repair or replace any work which has been stained, marred or otherwise damaged during the work under this Section.

B. Upon completion remove unused materials, containers and equipment and clean up area.

SECTION 21 13 00

FIRE SUPPRESSION SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These provisions specified herein apply to all Sections of Division 21.

B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to all Sections of Division 21.

1.2 WORK INCLUDED

A. Furnish all labor, materials, tools, and equipment to complete the automatic fire sprinkler system as hereinafter described, ready for service to the entire satisfaction of the Using Agency. Provide hydraulically calculated systems as defined in the adopted edition of NFPA 13 and in accordance with State Fire Marshall requirements.

B. This section is a performance specification section only. The design build fire protection contractor shall be fully responsible for the design and to provide necessary equipment and hardware per local fire protection codes.

C. Fire Sprinkler System Notes:

1. The automatic sprinkler system shall conform to the requirements of the adopted edition of UFC 3-600-01 and NFPA Standard 13.
2. Installation of the sprinkler system shall not be started until complete plans and specifications including water supply design information and type of existing sprinkler system, if any have been submitted and approved by the State Fire Marshal, Fire/Life Safety Section. At various stages and upon completion, the system must be tested in the presence of the Inspector of Record (IOR) and/or Authority Having Jurisdiction (AHJ).
3. Underground firewater and sprinkler system work shall conform to the requirements of NFPA 24 and NFPA 13n. Prior to installation of the underground fire water supply system, submit shop drawings and specifications of system, including water flow test data to the State Fire Marshal, Fire/Life Safety Section for approval. Submittal shall include thrust block location and size, type of piping and catalog cut sheets on all valves and fittings. An inspection of the underground installation, back flush and hydrostatic test shall be conducted and witnessed by the Professional, IOR and/or AHJ prior to backfill.

D. Verify electrical requirements of alarm valves, flow switches, valve supervision switches, alarm bells and pumps with electrical contractor.

1.3 RELATED WORK AND REQUIREMENTS

A. All Division 21 sections.

B. Section 23 00 10 – Mechanical General Provisions

C. Section 23 05 00 – Basic Mechanical Materials and Methods

1.4 REFERENCE STANDARDS

A. American National Standards Institute (ANSI)

1. B16.1 Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800
2. B16.3 Malleable-Iron Castings
3. B16.4 Cast-Iron Threaded Fittings Class 125 and 300
4. B16.5 Pipe Flanges and Flanged Fittings
5. B16.9 Factory-Made wrought Steel Butt welding Fittings
6. B16.11 Forged Fittings, Socket-Welding and Threaded
7. B16.22 Wrought Copper and Bronze Solder Joint Pressure Fittings
8. B16.25 Butt welding Ends

B. American Society for Testing and Materials (ASTM)

1. A36 Structural Steel
2. A47 Ferritic, Malleable Iron Castings
3. A53 Pipe, Steel, Black and Hot-Dipped, Zinc Coated
4. A135 Specification for Electric-Resistance-Welded Steel Pipe
5. A194 Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure and High-Temperature Service
6. A320 Specification for Alloy Steel Bolting Materials for Low-Temperature Service
7. A795 Specification for Black and Hot-Dipped Zinc-Coated (Galvanized) Welded and Seamless Steel Pipe for Fire Protection Use
8. B88 Seamless Copper Water Tube

C. American Water Works Association (AWWA)

1. C104 Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
2. C110 Gray Iron and Ductile Iron Fittings
3. C111 Rubber Gasket Joints for Ductile-Iron and Grey-Iron Pressure: Pipe and Fittings
4. C151 Thickness of Ductile-Iron Pipe – Centrifugally Cast
5. C200 Steel Water Pipe 6” and larger
6. C503 Wet-Barrel Fire Hydrants

D. International Association of Plumbing and Mechanical Officials (IAPMO)

1. PS 31 Backflow Prevention Devices

E. National Fire Protection Association (NFPA)

1. 13 Installation of Sprinkler Systems

F. Underwriter’s Laboratory (UL)

1. 262 Gate Valves for Fire Protection Service
2. Indicator Post for Fire-Protection Service

G. Unified Facilities Criteria (UFC)

1. 3-600-01 Fire Protection Engineering for Facilities

1.5 DESIGN CRITERIA

A. Design sprinkler systems and obtain approval from AHJ.

B. Determine the static and residual pressure for the site as required for accurate determination of system requirements. Base system calculations on the lowest expected static and residual pressure for the area.

1. Test data for static and residual pressure shall be measured by the Contractor. Test shall be made within the presence of the Professional and at a time approved by the Professional and Using Agency.

C. It is the intent of these Specifications and Drawings to provide for a complete and operating automatic fire protection sprinkler system in full compliance with the standards of the National Fire Protection Association as set forth in NFPA Pamphlet No. 13 and UFC 3-600-01, currently adopted editions.

D. Review Architectural and Structural Drawings to determine the extent of construction and resultant fire protection coverage to comply with NFPA. Interstitial spaces, if utilized, will require sprinkler protection.

E. Provide fire sprinklers to protect all building overhangs greater than 4 feet wide, or as required by local authority.

F. Provide additional fire sprinklers where required to meet the requirements of NFPA13. Coordinate with the work of other trades especially when it may create interferences and or obstructions requiring special protection, additional piping and heads and drains.

G. The maximum permissible flow velocity through automatic sprinkler piping shall be 15 feet per second. The minimum starting pressure at the most remote sprinkler head shall be not less than the minimum required to operate the sprinkler head.

H. Reduction in area of operation when use of quick response sprinkler heads as defined in NFPA 13 will not be allowed.

I. Use of piping lighter than Schedule 10 is not allowed.

J. The initial building shall contain basic sprinkler coverage which can be modified and extended for the future build-out of unimproved spaces.

K. Design shall comply with the Using Agency’s Insurance Underwriters’ requirements.

1.6 COORDINATION/SPECIAL CONSIDERATIONS

A. Coordinate with other trades all equipment locations, pipe, duct and conduit runs, electrical outlets and fixtures, air inlets and outlets, and structural and architectural features. Provide information on location of piping and bracing to all other trades as required for a completely coordinated project.

B. Contract Drawings: All piping required for the sprinkler and standpipe systems is not shown, but general arrangement of system piping, required standpipes, outlets and valves, alarm valves and areas requiring sprinkler protection are shown.

C. Where heads are located at suspended ceiling, spacing shall be as required by NFPA 13, except as follows: In all locations, sprinkler heads shall be equidistant between lights, between wall and lights,

between lights and air diffusers, and between wall, lights, and air diffusers. Provide uniform and repetitive pattern for each room. Locate by reflected ceiling plan where shown.

D. Install sprinkler all sprinkler heads in center of ceiling tiles.

E. Provide approved dry pendant sprinkler heads in spaces subject to freezing.

F. Provide high temperature sprinkler heads in all electrical rooms or other areas with elevated temperatures such as mechanical rooms.

G. Coordinate Work among the trades in accordance with Section 01 31 00 to avoid any interference with the effectiveness of the fire protection system. Shop drawings shall include elevations of equipment and piping to assure coordination. The fire protection system shall be coordinated with other trades to assure that conflicts will not arise with structural, mechanical, electrical or architectural features of the building.

H. Coordinate with the fire alarm contractor to ensure full awareness of the location of control valves, flow switches, tamper switches, and alarm and signal switches.

1.7 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of fire protection products, of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Installer: A firm with at least five years of successful installation experience on projects with fire sprinkler piping similar to that required for this project.

C. Requirements of Regulatory Agencies:

1. Install fire protection systems in accordance with IBC – 2012 Edition, Chapter 9 “Fire Protection Systems”.
2. NFPA Compliance: Install fire protection systems in accordance with NFPA 13 "Standard for the Installation of Sprinkler Systems", 2010 Edition, and other pertinent NFPA requirements. Comply also with NFPA 14 for standpipes.
3. FM Compliance: Comply with Factory Mutual "Approval Guide".
4. UL Labels: Provide fire sprinkler piping products which have been approved and labeled by Underwriters' Laboratories.
5. Fire Marshal Compliance: Install fire protection systems in accordance with State Fire Marshal and Campus Fire Marshal.
6. Screw Thread Connections: Comply with local fire department/marshal regulations for sizes, threading, and arrangement of connections for fire department equipment to systems.

D. Fire stop penetrations with an approved material as prescribed in IBC – 2012 Edition, Chapter 7.

E. Installation of the sprinkler system shall not be started until complete plans and specifications (including water supply information and type of existing sprinkler system, if any) have been reviewed by the AHJ and the Using Agency’s Insurance Underwriter.

F. At various stages and upon completion, the system must be tested in the presence of the enforcing agency.

G. The fire extinguishing system shall be installed by a licensed fire systems contractor.

1.8 SUBMITTALS

A. See Section 01 33 00 – Shop Drawings, Product Data and Samples

B. See Section 23 00 10 – Mechanical General Provisions

C. Submittals shall include, but not be limited to, the following and shall clearly show the State Fire Marshal (SFM) listing numbers:

1. Pipe and fittings.
2. Valves.
3. Sprinkler heads.
4. Gauges.
5. Sleeves and Escutcheons.
6. Flow switches.
7. Tamper switches.
8. Alarm bells.
9. Pipe hangers and supports.
10. Identification signs.
11. Sprinkler head cabinets.
12. Hose Valve cabinets.

D. Submit shop drawings as follows:

1. Prepare and submit preliminary drawing to the Using Agency showing the proposed location of the fire sprinkler heads coordinated with and in relation to the ceiling tile pattern, light fixture and duct inlets/outlets. Review of this drawing and the Fire Marshal's review stamp thereon shall be a prerequisite for the preparation of further working plans.
2. Detailed working drawings and hydraulic calculations shall be prepared and submitted for approval before fabrication of the project. Working drawings shall be submitted in complete sets (partial submission will not be acceptable) and shall bear the Contractor's license stamp, identity of the system designer and computer program used in the calculation of hydraulic information.
3. Fire Marshal approval of submittals is for permission to proceed and does not authorize design, products or installation not conforming to referenced codes and standards and this specification. Substitutions or alternates require specific approval by the Using Agency.
4. Upon completion of the Work, the Contractor shall provide AutoCAD computer files and a set of Mylar film reproducible Record Drawings to the Professional. Refer also to Section 017800. Final approvals are subject to receipt of acceptable Record Drawings.

E. Submittals having any content that is incomplete or unclear will be returned without review or approval.

F. Deferred Approval Documents: Do not proceed with fabrication or installation of fire sprinkler system until deferred approval documents have been approved by AHJ and Professional.

1. General: Provide detailed drawings, specifications, and calculations prepared by a State of Mississippi licensed professional fire protection engineer per UFC 3-600-01. Drawings, specifications and calculations shall bear qualified Fire Protection Engineer's stamp. See UFC 3-600-01 for fire protection engineer's services and qualifications.
2. Fire Protection Engineer shall certify in writing that the design is in compliance with UFC 3-600-01.
3. Make additions, changes and corrections as directed by Professional and resubmit.
4. Agency Review: Submit documents to Using Agency and/or AHJ. Make additions, changes

and corrections required by Using Agency / AHJ at no cost to Using Agency and resubmit to Professional.

G. Provide all necessary information to ceiling suspension work of Division 09, Finishes, to provide coordinated submittals.

H. Discharge patterns and application data shall be included in submittals for sidewall, water curtain, and similar special purpose sprinklers.

I. Operating Instructions: Provide instruction charts describing operation and proper maintenance of system equipment per Section 01 78 00.

PART 2 - MATERIALS

2.1 MANUFACTURERS

A. Provide piping materials and factory-fabricated piping products of sizes, types, pressure rating, temperature ratings, and capacities as required. Provide sizes and types matching piping and equipment connections; provide fittings of materials that match pipe materials used in fire protection systems.

B. Equipment to be furnished under this specification shall be essentially standard product of manufacturer. Where two or more units of same class of equipment are required, these units shall be products of a single manufacturer. However, component parts of system need not be products of same manufacturer.

C. Manufacturers: Subject to compliance with requirements, manufacturer offering automatic sprinklers which may be incorporated in the work include the following:

1. Specialty Valves and Devices:

    a. Badger Fire Protection, Inc.
    b. Central Sprinkler Corp.
    c. Firematic Sprinkler Devices, Inc.
    d. Globe Fire Sprinkler Corp.
    e. Grinnell Corp.
    f. Reliable Automatic Sprinkler Co., Inc.
    g. Star Sprinkler Corp.
    h. Viking Corp.

2. Water-Flow Indicators and Supervisory Switches:

    a. Grinnell Corp.
    b. Potter Electric Signal Co.
    c. Reliable Automatic Sprinkler Co., Inc.
    d. Viking Corp.
    e. Watts Industries, Inc.; Water Products Div.

3. Sprinkler, Drain and Alarm Test Fittings:

    a. Central Sprinkler Corp.
    b. Grinnell Corp.
    c. Victaulic Co. of America.

4. Sprinkler, Branch-Line Test Fittings:

    a. Elkhart Brass Mfg. Co., Inc.
    b. Smith Industries, Inc.; Potter-Roemer Div.

5. Sprinkler, Inspector's Test Fittings:

    a. G/J Innovations, Inc.
    b. Triple R Specialty of Ajax, Inc.

6. Fire Department Connections:

    a. Badger Fire Protection, Inc.
    b. Elkhart Brass Mfg. Co., Inc.
    c. Firematic Sprinkler Devices, Inc.
    d. Grinnell Corp.
    e. Guardian Fire Equipment, Inc.
    f. Reliable Automatic Sprinkler Co., Inc.
    g. Smith Industries, Inc.; Potter-Roemer Div.

7. Sprinklers:

    a. Badger Fire Protection, Inc.
    b. Central Sprinkler Corp.
    c. Firematic Sprinkler Devices, Inc.
    d. Globe Fire Sprinkler Corp.
    e. Grinnell Corp.
    f. Reliable Automatic Sprinkler Co., Inc.
    g. Star Sprinkler Corp.
    h. Viking Corp.

8. Indicator Posts and Indicator-Post, Gate Valves:

    a. American Cast Iron Pipe Co.; Waterous Co.
    b. Grinnell Corp.
    c. McWane, Inc.; Clow Valve Co. Div.
    d. McWane, Inc.; Kennedy Valve Div.
    e. Nibco, Inc.
    f. Stockham Valves & Fittings, Inc.

9. Indicator Valves:

    a. Central Sprink, Inc.
    b. Grinnell Corp.
    c. McWane, Inc.; Kennedy Valve Div.
    d. Milwaukee Valve Co., Inc.
    e. Nibco, Inc.
    f. Victaulic Co. of America.

10. Fire-Protection-Service Valves:

    a. Central Sprink, Inc.
    b. Central Sprinkler Corp.
    c. Grinnell Corp.

d. McWane, Inc.; Kennedy Valve Div.
e. Nibco, Inc.
f. Stockham Valves & Fittings, Inc.
g. Victaulic Co. of America.

11. Press-Seal Fittings for Steel Piping:

a. Victaulic Co. of America

2.2 VALVE AND ALARM SYSTEM IDENTIFICATION

A. Provide identification complying with Section 23 05 53, Mechanical Identification section in accordance with the following listing:

1. Fire Protection Valves: Brass valve tags.
2. Fire Protection Signs: Provide the following signs:

a. At each sprinkler valve, including roof manifold, sign indicating what portion of system valve controls.
b. At each outside alarm device, sign indicating what authority to call if device is activated.

2.3 BASIC PIPES AND TUBES

A. Piping shall be new, designed for 300 psi working pressure, conforming to ASTM specifications and have the manufacturer's name or brand along with the pipe applicable ASTM standard marked on each length of pipe.

B. All piping shall be UL listed and FM approved.

C. Piping installed underground: Ductile Iron AWWA C111 and C151.

D. Piping installed above ground 2 inch and smaller shall be Schedule 40 black steel pipe. Pipe shall be manufactured in accordance with specifications ASTM A-135 and A-53.

E. Piping installed above ground 2-1/2 inch and larger shall be Schedule 10 black steel pipe. Pipe shall be manufactured in accordance with specification ASTM A 135.

F. All fire protection piping shall be provided with factory-applied antimicrobial coatings to inhibit Microbiologically-Influenced Corrosion (MIC). Allied Tube and Conduit "ABF II", Wheatland Tube Company "MIC Shield" or equal.

G. Sprinkler piping and fittings exposed to weather, used in a corrosive atmosphere or as noted on drawings shall be galvanized.

H. In-Building Risers shall be installed as indicated on the plans. Risers shall be composed of a single extended 90 degree fitting of fabricated 304 stainless steel tubing, maximum working pressure 300 psi. The fitting shall have a grooved-end connection on the outlet (building) side and a CIPS coupler on the inlet (underground) side. The In-Building Riser shall be an Ames Fire & Waterworks Series IBR (or approved equal).

2.4 PIPE AND TUBE FITTINGS

A. Cast-Iron Threaded Flanges: ASME B16.1.

B. Cast-Iron Threaded Fittings: ASME B16.4.

C. Ductile-Iron Fitting: AWWA C110, ductile-iron or cast-iron type; or AWWA C153, ductile-iron, compact mechanical-joint type. Include cement-mortar lining and seal coat according to AWWA C104 and glands, rubber gaskets, and bolts and nuts according to AWWA C111.

D. Ductlie-Iron Fittings: ASTM A47, malleable-iron or ASTM A 536 ductile-iron casting complying with AWWA pipe size; with ends factory grooved according to AWWA C606.

E. Malleable-Iron Threaded Fittings: ASME B16.3.

F. Steel, Threaded Couplings: ASTM A 865.

G. Steel Welding Fittings: ASTM A 234/A 234M, ASME B16.9, or ASME B16.11.

H. Steel Flanges and Flanged Fittings: ASME B16.5.

2.5 PIPING SPECIALTIES

A. Provide piping specialties complying with Section 23 05 00, Basic Mechanical Materials and Methods section in accordance with the following listing:

1. Pipe escutcheons
2. Dielectric unions
3. Pipe sleeves
4. Sleeve seals

2.6 JOINING MATERIALS

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for pipe-flange gasket materials and welding filler metals.

B. Grooved-End Pipe Couplings: UL 213 and AWWA C606, rigid pattern, unless otherwise indicated; gasketed fitting matching steel pipe OD. Include ductile-iron housing with keys matching steel pipe fitting grooves, prelubricated rubber gasket listed for use with housing and steel bolts and nuts. Include listing for dry-pipe service for couplings for dry piping.

C. Steel, Grooved-End Fittings: UL-listed and FM approved, ASTM A47, malleable iron or ASTM A 536, ductile iron, with dimensions matching steel pipe and ends factory grooved according to AWWA C606.

D. Transition Couplings: AWWA C219, sleeve type, or other manufactured fitting the same size as, with pressure rating at least equal to, and with ends compatible with piping to be joined.

2.7 POLYETHYLENE ENCASEMENT

A. Polyethylene Encasement for Ductile-Iron Piping: ASTM A674 or AWWA C105 film, 0.008-inch minimum thickness, tube or sheet.

2.8 SUPPORTS AND ANCHORS

A. Provide supports and anchors complying with Section 23 05 00 - Basic Mechanical Materials and Methods section, in compliance with referenced standards.

B. Spacing and details of the support and bracing of fire sprinkler piping shall comply with the currently adopted edition of NFPA 13. U-hook hangers used as sway bracing must have legs bent out 10 degrees and must have a slenderness ratio not exceeding 200.

C. Concrete Inserts: Uni-Strut P-3200 continuous insert or M24 spot insert Kin-line or equal. Do not use powder actuated fasteners for support of overhead piping unless approved by Professional.

2.9 VALVES

A. Provide valves, UL listed and FM approved, in accordance with the following listing. Provide sizes and types which mate and match piping and equipment connections.

1. Gate Valves: Provide iron gate control valve, outside screw and yoke (OS&Y), 175-lb rated working pressure, of sizes indicated, to close by turning to the right and to be sealed with approved metal seals. Valves shall be iron body, bronze fitted. Valves 2 inches and smaller shall be screwed and valves over 2 inches shall be flanged. For reference purposes, Mueller A-2073-6. Grinnell, Kennedy, Stockham or equal.
2. Butterfly Valve: Provide UL listed FM approved butterfly valves (slow-close) with position indicators. Electric motor operated valves shall be normally open and shall fail in the open position. For reference purposes, Mueller B-3211. Grinnell, Kennedy, Stockham or equal.
3. Swing Check Valves: Provide UL listed flanged, swing type, iron body, bronze seat ring and disc ring, and 175 psi pressure rating. For reference purposes, Mueller A-2120-6, Grinnell, Kennedy, Stockham or equal.
4. Riser Drain Valves: Main Riser Drain valves shall be angle or globe type, bronze body, screwed, 200 psi pressure rating, 2 inches size, with renewable composition soft disc. For reference purposes, Grinnell 3210, Stockham, NIBCO, Fairbanks or equal.
5. Auxiliary Drain Valve: Valves for auxiliary drains and Using Agency's Test connections shall be globe type, bronze body, screwed, 200 psi pressure rating, 1 inch size, with a renewable composition soft disc, For reference purposes, Grinnell 3210, Stockham, NIBCO, Fairbanks or equal.
6. Indicating Valves, 2-1/2 inches and Smaller: UL 1091; butterfly or ball-type, bronze body with threaded ends; and integral indicating device.

    a. Indicator: Electrical 115-V AC, prewired, single-circuit, supervisory switch.

7. Indicator Posts: UL 789, vertical type, cast iron body, with windows for target plates that indicate valve position, extension rod and coupling, locking device, and red enamel finish.

    a. Operation: Hand wheel.

8. Swing Check Valves, 2 inches and Smaller: UL 312 or MSS SP-80, Class 150; bronze body with bronze disc and threaded ends.
9. Swing Check Valves, 2-1/2 inches and Larger: UL 312, cast-iron body and bolted cap, with bronze disc or cast-iron disc with bronze-disc ring and flanged ends.
10. Split-Clapper Check Valves, 4 inches and Larger: UL 312, cast-iron body with rubber seal, bronze-alloy discs, and stainless-steel spring and hinge pin.
11. For other valves not required to be UL listed and FM approved refer to Section 23 05 23 - Valves.

2.10 METERS AND GAUGES

A. Provide meters and gauges complying with Section 23 05 00 - Basic Mechanical Materials and Methods section or Piping Specialties, in accordance with the following listing:

1. Pressure gauges: UL 393, 3-1/2- to 4-1/2-inch- diameter dial with dial range of 0 to 300 psig

2.11 SPECIALTY VALVES

A. Sprinkler System Control Valves: UL listed or FMG approved, cast or ductile-iron body with flanged or grooved ends, and 175-psig minimum pressure rating.

1. Available Manufacturers:

   a. Central Sprinkler Corp.
   b. Firematic Sprinkler Devices, Inc.
   c. Globe Fire Sprinkler Corporation.
   d. Grinnell Fire Protection.
   e. Reliable Automatic Sprinkler Co., Inc.
   f. Star Sprinkler Inc.
   g. Victaulic Co. of America.
   h. Viking Corp.

2. Alarm Check Valves: UL 193, designed for horizontal or vertical installation, with bronze grooved seat with O-ring seals, single-hinge pin, and latch design. Include trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, retarding chamber, and fill-line attachment with strainer.

   a. Drip Cup Assembly: Pipe drain without valves and separate from main drain piping.

3. Ball Drip Valves: UL 1726, automatic drain valve, NPS 3/4, ball check device with threaded ends.

2.12 FIRE PROTECTION SPECIALTIES

A. Provide fire protection specialties, UL listed, in accordance with the following listing. Provide sizes and types that match piping and equipment connections.

1. Install drains on main risers and auxiliary drains at all low points in the system.
2. One Owner’s test drain shall be installed for each sprinkler system.
3. Drains and Owner’s tests shall be at locations approved by the Professional.
4. Drains and Owner’s tests shall be installed at locations as shown on the Drawings.
5. Provide drain line to floor sink or to outside, as required, to suit Project conditions.
6. Five or fewer trapped heads will not require a drain valve but may be drained through a plugged fitting.
7. Drain valve shall be of the angle type. Install in accordance with the requirements of NFPA Pamphlet No. 13.
8. Pipe drain valves to a floor sink or to the outside of the building. Discharge shall be visible from sight drain fitting or open end drain pipe. Provide flushing connections at ends of all cross mains.
9. Flow Alarm: Furnish and install a flow alarm system for each main sprinkler riser as shown on the Drawings. The systems shall be complete with Grinnell F-620, Viking or equal, flow

switch. As part of Division 16, wire flow alarm to the fire alarm control panel. Provide 3/4-inch conduit and two #14 wires from the tamper switch to the fire department control panel.

10. Provide wiring between switch, bell, and junction box. Provide junction box under Division 26. Wiring shall meet the requirements of Division 26. All controls shall be identified by permanent metal tags or other approved means. Alarm switch shall be UL or FM approved and shall have adjustable retard mechanism and two sets of contacts. Wiring between electrical distribution panel and junction box will be provided under Division 26.
11. Water-Flow Indicators: UL 346; electrical-supervision, vane-type water-flow detector; with 250-psig pressure rating; and designed for horizontal or vertical installation. Include two single-pole, double-throw, circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.
12. Pressure Switches: UL 753; electrical-supervision-type, water-flow switch with retard feature. Include single-pole, double-throw, normally closed contacts and design that operates on rising pressure and signals water flow.
13. Valve Supervisory Switches: UL 753; electrical; single-pole, double throw; with normally closed contacts. Include design that signals controlled valve is in other than fully open position, Grinnell Model F640, Viking or equal, with single pole double throw switch actuator installed to change switch position when OS&Y valve is being closed.
14. Indicator-Post Supervisory Switches: UL 753; electrical; single-pole, double throw, with normally closed contacts. Include design that signals controlled indicator-post valve is in other than fully open position.
15. As part of Division 26, wire supervisory switch to the fire alarm control panel. Provide 3/4-inch conduit and two #14 wires from the tamper switch to the fire department control panel.

2.13 AUTOMATIC SPRINKLERS

A. Provide automatic sprinklers in accordance with the following listing. Provide fusible links for 165 degrees F. unless otherwise noted; UL or FM approved.

B. Automatic Sprinklers: With heat-responsive element complying with the following:

1. UL 199, for applications except residential.
2. UL 1767, for early suppression, fast-response applications.

C. Type: Spray pattern type, automatic closed-type heads of ordinary degree temperature rating, except that sprinklers to be installed in vicinity of heating equipment shall be of temperature ratings required for such locations by the currently adopted edition of NFPA 13.

1. Flush ceiling sprinklers, including escutcheon.
2. Pendent, dry-type sprinklers.
3. Quick-response sprinklers.
4. Sidewall, dry-type sprinklers.
5. Upright sprinklers.
6. Concealed ceiling sprinklers, including cover plate.

D. Sprinkler heads shall be UL or FM listed.

1. Exposed Locations: Provide upright type heads at all areas with no finished ceilings.
2. Where heads are located at height of less than 8 feet above finished floor, or where heads are located in mechanical equipment areas, provide wire guards to protect heads from damage.
3. Concealed Locations: Provide upright-type heads or pendent-type heads.
4. Sidewall Locations: Where required and where approved by the Professional.

5. Finished Ceilings: Locate at all ceilings with lay-in acoustical tile ceiling and at plaster or gypsum board type ceilings. Provide satin chrome finish and adjustable chrome finish metal ceiling escutcheons. Provide fully recessed pendant type and white enamel metallic cover in hard ceilings of finished spaces.
6. Where fire sprinkler heads are located in rooms with surface mounted lights, provide 2 piece adjustable sprinkler escutcheon, with adjustment from 1-7/8" to 3-1/8" below finished ceiling. Fire sprinkler drop nipple should be mounted 2-1/4" below the finished ceiling surface.
7. Sprinkler heads in light hazard area shall be quick response type.
8. Extended coverage sprinklers shall not be used.

E. Sprinkler Finishes: Chrome-plated, bronze, and painted.

F. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers.

1. Ceiling Mounting: Chrome-plated steel, one piece, flat.
2. Sidewall Mounting: Chrome-plated steel, one piece, flat.

G. Sprinkler Guards: Wire-cage type, including fastening device for attaching to sprinkler.

H. Sprinkler Cabinet and Wrench: Furnish steel, baked red enameled, sprinkler box with capacity to store sprinklers and wrench sized to sprinklers. Spare sprinklers and wrenches called for under "Extra Stock."

2.14 SPECIALTY SPRINKLER FITTINGS

A. Specialty Fittings: UL listed and FM approved; made of steel, ductile iron, or other materials compatible with piping.

B. Press-Seal Fittings: UL 213, steel housing with butylene O-rings and pipe stop.

C. Locking-Lug Fittings: UL 213, ductile-iron body with locking-lug ends.

D. Mechanical-Cross Fittings: UL 213, ductile-iron housing with pressure-responsive gaskets, bolts, and threaded or locking-lug outlets.

E. Drop-Nipple Fittings: UL 1474, with threaded inlet, threaded outlet, and seals; adjustable.

F. Sprinkler, Drain and Alarm Test Fittings: UL-listed, cast- or ductile-iron body; with threaded inlet and outlet, test valve, and orifice and sight glass.

G. Sprinkler, Branch-Line Test Fittings: UL-listed, brass body; with threaded inlet and capped drain outlet and threaded outlet for sprinkler.

H. Sprinkler, Inspector's Test Fittings: UL-listed, cast- or ductile-iron housing; with threaded inlet and drain outlet and sight glass.

I. Flexible Hose Assemblies: FlexHead Industries flexible stainless steel hose assembly consisting of a mounting bracket and a one-piece, leak tested sprinkler drop. The mounting bracket shall be compatible with any suspended or gypsum board ceiling system and FM/UL approved sprinklers. Assembly shall be FM approved and UL listed for use intended. Lengths of assemblies shall be selected with minimum length required to connect sprinkler without loops, traps, etc.

2.15 FIRE DEPARTMENT CONNECTIONS

A. Exposed Inlet type, Fire Department Connections: UL 405, 175-psig minimum pressure rating; with corrosion-resistant-metal body with brass inlets, brass wall escutcheon plate, brass lugged caps with gaskets and brass chains, and brass lugged swivel connections. Include inlets with threads according to NFPA 1963 and matching local fire department sizes and threads, outlet with pipe threads, check devices or clappers for inlets, and escutcheon plate with marking similar to "AUTO SPKR."

1. Finish: Polished chrome-plated.

B. Exposed, Free-Standing type, Fire Department Connections: UL 405, 175-psig minimum pressure rating; with corrosion-resistant-metal body with brass inlets, brass wall escutcheon plate, brass lugged caps with gaskets and brass chains, and brass lugged swivel connections. Include inlets with threads according to NFPA 1963 and matching local fire department sizes and threads, outlet with pipe threads, check devices or clappers for inlets, and escutcheon plate with marking similar to "AUTO SPKR."

1. Finish: Polished chrome-plated.

PART 3 - EXECUTION

3.1 PRODUCT HANDLING AND PROTECTION

A. Deliver packaged materials in their original, unopened wrapping with labels intact. Protect materials from water, the elements and other damage during delivery, storage and handling.

3.2 PREPARATORY PROVISIONS

A. The Contractor shall be responsible for the examination and acceptance of all conditions affecting the proper construction and/or installation of the Work of this Section and shall not proceed until all unsatisfactory conditions have been corrected. Commencing work shall be construed as acceptance of all conditions by the Contractor as satisfactory for the construction and/or installation of the Work.

B. Perform fire-hydrant flow test according to NFPA 13 and NFPA 291. Use results for system design calculations.

C. Report test results promptly and in writing

3.3 EARTHWORK

A. Refer to Division 31 Section "Trenching, Backfilling, and Compaction" for excavating, trenching, and backfilling.

3.4 PIPING APPLICATIONS

A. Do not use welded joints with galvanized steel pipe.

B. Flanges, unions, and transition and special fittings with pressure ratings the same as or higher than

system's pressure rating may be used in aboveground applications, unless otherwise indicated.

C. Piping between Fire Department Connections and Check Valves: Use galvanized, standard-weight steel pipe with threaded ends; cast- or malleable-iron threaded fittings; and threaded joints.

D. Underground Water Supply and Service-Entrance Piping: Use ductile-iron, mechanical-joint pipe and fittings and restrained joints. Include corrosion protective encasement. Use In-Building Riser for service-entrance piping

3.5 SPRINKLER SYSTEM PIPING APPLICATIONS

1. 1-1/2 inches and Smaller: Standard-weight black steel pipe with threaded ends, cast-or malleable-iron threaded fittings, and threaded joints.
2. 2 inch: Standard-weight black steel pipe with threaded ends, cast- or malleable-iron threaded fittings, and threaded joints.
3. 2 inch: Standard-weight black steel pipe with grooved ends; steel, grooved-end fittings; steel, keyed couplings; and grooved joints.
4. 2-1/2 to 3-1/2 inches: Schedule 10 black steel pipe with threaded ends, cast- or malleable-iron threaded fittings, and threaded joints.
5. 2-1/2 to 3-1/2 inches: Schedule 10 black steel pipe with roll-grooved ends; steel, grooved-end fittings; steel, keyed couplings; and grooved joints.
6. 2-1/2 to 3-1/2 inches: Schedule 30 black steel pipe with plain ends, steel welding fittings, and welded joints.
7. 4 inch: Schedule 40 steel pipe with threaded ends, cast-or malleable-iron threaded fittings, and threaded joints.
8. 4 inch: Schedule 40 black steel pipe with roll-grooved ends; steel, grooved-end fittings; steel, keyed couplings; and grooved joints.
9. 4 inch: Schedule 40 black steel pipe with plain ends, steel welding fittings, and welded joints.
10. 5 and 6 inches: Standard-weight black steel pipe with threaded ends, cast- or malleable-iron threaded fittings, and threaded joints.
11. 5 and 6 inches: Standard-weight black steel pipe with grooved ends; steel, grooved-end fittings; steel, keyed couplings; and grooved joints.
12. 5 and 6 inches: Standard-weight black steel pipe with plain ends, steel welding fittings, and welded joints.

3.6 VALVE APPLICATIONS

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Fire-Protection-Service Valves: UL listed and FM approved for applications where required by NFPA 13.

   a. Shutoff Duty: Use gate valves.

2. General-Duty Valves: For applications where UL-listed and FM-approved valves are not required by NFPA 13.

   a. Shutoff Duty: Use gate, ball, or butterfly valves.
   b. Throttling Duty: Use globe, ball, or butterfly valves.

3.7 JOINT CONSTRUCTION

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for basic piping joint construction.

B. Threaded Joints: Comply with NFPA 13 for pipe thickness and threads. Do not thread pipe smaller than NPS 8 with wall thickness less than Schedule 40 unless approved by authorities having jurisdiction and threads are checked by a ring gage and comply with ASME B1.20.1.

C. Steel-Piping, Grooved Joints: Use Schedule 40 steel pipe with cut or roll-grooved ends and Schedule 30 or thinner steel pipe with roll-grooved ends; steel, grooved-end fittings; and steel, keyed couplings. Assemble joints with couplings, gaskets, lubricant, and bolts according to coupling manufacturer's written instructions. Use gaskets listed for dry-pipe service for dry piping.

D. Dissimilar-Metal Piping Joints: Construct joints using dielectric fittings compatible with both piping materials.

1. 2 inch and Smaller: Use dielectric couplings or nipples.
2. 2-1/2 to 4 inches: Use dielectric flanges.
3. 5 inch and Larger: Use dielectric flange insulation kits.

E. Dissimilar-Piping-Material Joints: Construct joints using adapters or couplings compatible with both piping materials. Use dielectric fittings if both piping materials are metal. Refer to Division 21 Section "Common Work Results for Fire Suppression" for dielectric fittings.

3.8 WATER SUPPLY AND SERVICE-ENTRANCE PIPING AND PIPING TO FIRE DEPARTMENT CONNECTION

A. Connect water supply piping to fire main; connect sprinkler piping to fire-service piping of size and in location indicated for service entrance to building.

B. Install shut-off valve, backflow preventer, pressure gage, and other accessories indicated at connection to water supply piping.

3.9 INSTALLATION OF FIRE SPRINKLER PIPING

A. General: Comply with the requirements of the Division 21 sections and referenced NFPA standards for installation of fire sprinkler piping material. Install fire sprinkler piping products where shown, in accordance with the manufacturer's written instructions, and in accordance with recognized industry practices to ensure that fire sprinkler piping complies with requirements and serves its intended purpose.

B. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.

1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with Professional before deviating from approved working plans.

C. Coordination: Coordinate all piping, heads, and sprinkler work to Architectural, Structural, Mechanical, and Electrical Work. Conceal piping, except where so indicated otherwise or where absolutely necessary. Place exposed piping where required by the Professional. Provide any offsets or additional piping required to coordinate this system with all other Work.

1. If piping is installed such that it is exposed to view in any location normally available to the users of the building or the public, it shall be relocated and concealed to the Professional's satisfaction, and at no additional cost to the Using Agency.

D. Any differences or disputes concerning coordination, interference, head and pipe locations or extent of work shall be decided by Professional and his decision shall be final.

E. Supply System: Provide supply connections as required to service the sprinkler system.

1. Installation shall conform to the applicable requirements of NFPA 13 and IBC.
2. Make joints as specified herein and in a manner approved by Professional. Leave joints exposed until final inspection and tests have been made.
3. Brace or clamp bends in accordance with the requirements. The clamp rods at the flange and spigot piece shall be long enough to pass through the flange.
4. Before connection of sprinkler system to underground supply, flush supply connections out thoroughly in accordance with NFPA.

F. Piping and Fittings Above Ground:

1. Install pipe, fittings, and hangers in accordance with requirements of IBC – 2012 Edition, Chapter 9 "Fire Protection Systems".
2. Cutting structural members for passage of sprinkler piping or for pipe hanger fastening will not be permitted except on review of Professional for each specific case.
3. Holes through walls, floors, and ceilings shall be large enough to accommodate pipe expansion. Provide suitable plates at each hole to ensure the effectiveness of floor or wall as a fire stop. Foundation penetration shall have a 2-inch annular space around pipe sealed watertight.
4. Provide long runs of pipe with suitable means to permit free movement due to expansion and contraction.
5. Make reduction in pipe sizes with one-piece concentric tapered reducing fittings. Bushings will not be acceptable.
6. Couplings shall not be used except where the length of pipe between fittings exceeds 20 feet 0 inches.
7. Use flanged fittings in control valves and drain assembly and at the base of risers.
8. Use malleable iron unions of the ground joint type in looped sprinkler systems where pipe is 2 inches in diameter or smaller. Where loops larger than 2 inches are used, companion flanges shall be installed.
9. Special couplings approved for use in sprinkler systems may be used in place of unions and flanged connections where applicable.
10. Install sectional valves in inlet piping, at bottom of each riser, and in all loops as required.
11. Mount supervisory switches on each sectional valve.
12. Install pressure gages at top of each standpipe.
13. Install valved hose connections 3/4-inch size on sprinkler at ends of branch lines and cross mains.
14. Install Owner's test connection at most remote point from riser.

G. Install ductile iron underground water supply and service-entrance piping according to NFPA 24 and with restrained joints. Encase piping in corrosion-protective encasement.

H. Install unions adjacent to each valve in pipes 2 inches and smaller. Unions are not required on flanged devices or in piping installations using grooved joints.

I. Install flanges or flange adapters on valves, apparatus, and equipment having 2-1/2 inches and larger connections.

J. Install "Inspector's Test Connections" in sprinkler piping, complete with shutoff valve, sized and located according to NFPA 13.

K. Install sprinkler zone control valves, test assemblies, and drain risers adjacent to sprinkler risers when sprinkler branch piping is connected to sprinkler risers.

L. Install ball drip valves to drain piping between fire department connections and check valves. Drain to floor drain or outside building.

M. Install sectional valves in piping.

N. Mount supervisory switches on each sectional valve.

O. Install valved hose connections of the sizes indicated, or 3/4 inch size, if not otherwise indicated, on sprinklers at ends of branch lines and cross mains at locations where indicated.

P. Install drain piping at low points of fire sprinkler piping.

Q. Identification: Apply signs to control, drain, test and alarm valves to identify their purpose and function. Provide lettering size and style selected by Authority Having Jurisdiction.

R. Hangers and Supports: Comply with NFPA 13 for hanger materials and installation.

S. Install piping with grooved joints according to manufacturer's written instructions. Construct rigid piping joints, unless otherwise indicated.

T. Install new pressure gages on riser or feed main, at each sprinkler test connection, and at top of each standpipe. Include pressure gages with connection not less than NPS 1/4 and with soft metal seated globe, valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they will not be subject to freezing.

U. Fill wet-pipe sprinkler and standpipe system piping with water.

3.10 SPECIALTY SPRINKLER FITTING INSTALLATION

A. Install specialty sprinkler fittings according to manufacturer's written instructions.

3.11 VALVE INSTALLATION

A. Refer to Section 23 05 23 - Valves for installing general-duty valves. Install fire-protection specialty valves, trim, fittings, controls, and specialties according to NFPA 13, manufacturer's written instructions, and authorities having jurisdiction.

B. Install listed fire-protection shutoff valves supervised-open, located to control sources of water supply except from fire department connections. Install permanent identification signs indicating portion of system controlled by each valve.

C. Specialty Valves:

1. Alarm Check Valves: Install in vertical position for proper flow, including bypass check valve and retarding chamber and drain-line connections.

3.12 SPRINKLER APPLICATIONS

A. General: Use sprinklers according to the following applications:

1. Rooms with Suspended Ceilings: Concealed sprinklers.
2. Mechanical Rooms, Basement, and Central Plant: Upright sprinklers.
3. Wall Mounting: Sidewall sprinklers.
4. Spaces Subject to Freezing: Upright; pendent, dry-type; and sidewall, dry-type sprinklers.
5. Special Applications: Use extended-coverage, flow-control, and quick-response sprinklers were applicable.
6. Sprinkler Finishes: Use sprinklers with the following finishes:

a. Upright, Pendent, and Sidewall Sprinklers: Polished bronze in finished spaces exposed to view; rough bronze in unfinished spaces not exposed to view.
b. Concealed Sprinklers: Rough brass with white cover.

3.13 FIRE DEPARTMENT CONNECTION INSTALLATION

A. Install Exposed-Inlet wall type, fire department connections.

B. Install ball drip valve at each valve for fire department connection.

3.14 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Connect water-supply piping to fire-suppression piping. Include backflow preventer between potable-water piping and fire-suppression piping. Refer to Section 22 11 19 – Domestic Water Piping Specialties for backflow preventers.

D. Install ball drip valves at each check valve for fire department connection. Drain to floor drain or outside building.

E. Connect piping to specialty valves, hose valves, specialties, fire department connections, and accessories.

F. Connection of alarm devices to fire alarm system by Division 26 Contractor.

G. Ground equipment according to Division 26 Section, “Grounding and Bonding Systems”.

H. Connect wiring according to Division 26 Section ”Conductors”.

I. Tighten electrical connectors and terminals according to manufacturer’s published torque-tightening values. If manufacturer’s torque values are not indicated, use those specified in UL 486A and UL 486B.

3.15 SLEEVES AND FLASHINGS

A. All sleeves shall be properly anchored in place during pouring of slabs. All pipe sleeves through

water resistant floors shall extend at least 1-1/2 inches above the finished floor and shall be watertight with the pipes passing through the sleeves. Sleeves passing through all other floors shall be of sufficient length to be flush with bottom of slab and extend one inch above the finished floor, and shall be securely anchored to the slab.

B. All piping passing through membrane water resistant walls and floors shall be provided with a water resistant type pipe sleeve, with Schedule 40 pipe extension or equal. Pack water resistant sleeves with white oakum and mastic.

C. Wherever pipes are exposed and pass through walls, floors, partitions or ceilings, they shall be fitted with chromium plated cast steel escutcheons held in place with setscrews. Care shall be taken to protect the escutcheons during the course of construction.

D. Sleeves in masonry or other walls shall be put in place as the construction progresses, avoiding the cutting of completed work.

E. All piping passing through fire-rated assemblies shall be installed within fire-rated pipe sleeves.

3.16 INSPECTION

A. Examine areas and conditions under which fire protection materials and products are to be installed.

B. After completion of the fire protection installation and at the start of the guarantee period, execute the National Automatic Sprinkler and Fire Control Association, Inc. standard form of “Inspection Agreement”, at no increase in Contract Sum, calling for four inspections of the sprinkler system during the guarantee year, plus the following maintenance to be performed during the course of the fourth inspection.

1. Operating of all control valves.
2. Lubrication of operating stems of all control valves.
3. Operating of electrical alarms.
4. Cleaning of alarm valves.
5. Lubrication of Fire Department hose connection inlets.

C. Fill out “Inspection Agreement” in triplicate after each inspection and send copies to the Owner, Insurance Carrier and Fire Department.

D. Welding inspection of the sprinkler system is to be done by the Campus Fire Marshal.

3.17 INSTALLATION OF BASIC IDENTIFICATION

A. Install mechanical identification in accordance with Section 23 05 53.

B. Install fire protection signs on piping in accordance with NFPA requirements.

C. Paint all exposed piping and including fire protection riser, color shall be selected by the Professional. See Division 09 Painting – Non VOC Paint.

3.18 FIELD QUALITY CONTROL

A. Sprinkler Piping Flushing: Prior to connecting sprinkler risers for flushing, flush water feed mains,

lead-in connections, and control portions of sprinkler piping. After fire sprinkler piping installation has been completed and before piping is placed in service, flush entire sprinkler system as required to remove foreign substances under pressure as specified in NFPA 13. Continue flushing until water is clear, and check to ensure that debris has not clogged sprinklers.

B. Hydrostatic Testing: After flushing system, test fire sprinkler piping hydrostatically for period of 2 hours at not less than 200 psi or at 50 psi greater than system pressure where pressure is anticipated to be in excess of 150 psi. Check system for leakage of joints. Measure hydrostatic pressure at low point of each system or zone being tested.

C. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Professional. At completion, carefully clean and adjust equipment and trim that are installed as part of this work. Leave systems and equipment in satisfactory operating condition. Repair or replace piping system as required to eliminate leakage in accordance with NFPA standards for "little or no leakage," and retest as specified to demonstrate compliance.

3.19 EXTRA STOCK

A. Heads: For each style and temperature range required, furnish additional sprinkler heads, amounting to one unit for every 100 installed units but not less than 10 heads, in proportion to the total number of each style of head.

B. Wrenches: Furnish two sprinkler wrenches for each type and size of sprinkler connection.

C. Obtain receipt from Using Agency that extra stock has been received.

3.20 CLEANING AND PROTECTION

A. Clean dirt and debris from sprinklers and other equipment.

B. Remove and replace sprinklers having paint other than factory finish.

C. Protect sprinklers from damage until Substantial Completion.

3.21 COMMISSIONING

A. Verify that specialty valves, trim, fittings, controls, and accessories are installed and operate correctly.

B. Verify that specified tests of piping are complete.

C. Verify that potable-water supplies have correct types of backflow preventers.

D. Verify that hose connections and fire department connections have threads compatible with local fire department equipment.

E. Fill wet-pipe standpipe piping with water.

F. Verify that hose connections are correct type and size.

G. Energize circuits to electrical equipment and devices.

H. Adjust operating controls and pressure settings.

I. Coordinate with fire alarm tests. Operate as required.

END OF SECTION 21 13 00

SECTION 22 11 16 - DOMESTIC WATER PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These Plumbing provisions specified herein apply to all Sections of Division 22.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 22.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Domestic water piping for fixtures and equipment inside the building

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 22 16 00 – Plumbing Specialties
3. Section 23 00 10 – Mechanical General Provisions
4. Section 23 05 00 – Basic Mechanical Materials and Methods
5. Section 23 05 23 – Valves
6. Section 23 05 16 – Piping Specialties

1.3 REFERENCE STANDARDS

A. ANSI/ASME B16.18 – Cast Copper Alloy Solder Joint Pressure Fittings

B. ANSI/ASME B16.22 – Wrought Copper and Copper Alloy Solder Joint Pressure Fittings

C. ANSI/ASME B16.24 – Bronze Pipe Flanges and Flanged Fittings

D. ANSI/ASTM B88 – Seamless Copper Water Tube

E. MSS SP-123 – Non Ferrous Threaded and Solder Joint Unions for Use with Copper Water Tube

1.4 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Piping and fitting materials	R			R
Solder	R			

C. Water Samples: Specified in "Cleaning" Article in Part 3 of this section.

D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

1.5 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation.

C. Comply with NSF 61, "Drinking Water System Components--Health Effects," Sections 1 through 9 for potable-water piping and components.

1.6 PROJECT CONDITIONS

A. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Using Agency or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicating:

1. Notify Using Agency no fewer than seven days in advance of proposed interruption of water service.
2. Do not proceed with interruption of water service without Using Agency’s written permission.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.2 COPPER TUBING

A. Soft Copper Tube: ASTM B 88, Types K and L (ASTM B 88M, Types A and B), water tube, annealed temper.

1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.
3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces and solder-joint or threaded ends.

B. Hard Copper Tube: ASTM B 88, Types L and M (ASTM B 88M, Types B and C), water tube, drawn

temper.

1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.
3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces and solder-joint or threaded ends.

2.3 VALVES

A. Refer to Section 23 05 23 - Valves for bronze and cast-iron, general-duty valves

B. Refer to Section 22 16 00 - Plumbing Specialties for balancing and drain valves

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate the work of other trades.

B. See Section 23 08 00 – Mechanical Commissioning

3.2 EXCAVATION

A. Refer to Division 02 for excavating, trenching and backfilling.

3.3 PIPING APPLICATIONS

A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below, unless otherwise indicated.

B. Flanges may be used on aboveground piping, unless otherwise indicated.

C. Domestic cold water; domestic hot water, and recirculating hot water, and industrial water, above ground:

1. Use Type L hard drawn copper with wrought copper fittings incorporating full solder cup. For sizes 2” and larger, joints shall be brazed with 1100 degree F melting point alloy with at least 5% silver. For sizes 1 ½” and smaller, may use lead free solder equal to 95/5.
2. Automatic faucets and flush valves shall be piped with copper tube or pipe. (No plastic tubing is allowed).

D. Domestic water below ground: Copper type K with brazed or silver solder joints.

E. Strainers for use in domestic water applications (copper pipe).

1. Strainers shall be based on Watts No. 777 or equal. Provide with a working water pressure (WWP) of 250 psi at 210qF, with a cast bronze body, threaded ends, solid retainer cap and a 20-mesh stainless steel screen (except the 3” size must have 3/64” perforations).

3.4 VALVE APPLICATIONS

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Shut-off Duty: Use bronze ball valves for piping NPS 3 and smaller. Use cast-iron butterfly or gate valves with flanged ends for piping NPS 3-1/2 and larger.
2. Throttling Duty: Use bronze ball or globe valves for piping NPS 2 and smaller. Use cast-iron butterfly valves with flanged ends for piping NPS 2-1/2 and larger.
3. Hot-Water-Piping, Balancing Duty: Calibrated balancing valves.
4. Drain Duty: Hose-end drain valves.

3.5 PIPING INSTALLATION

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for basic piping installation.

B. Extend domestic water service piping to exterior water distribution piping in sizes and locations to match service piping.

C. Domestic water piping beneath concrete slabs shall be avoided. Trap primer piping shall be type “L” copper tubing with no joints below slab. Piping penetrations shall be carefully detailed. Insulation through penetrations shall be continuous.

D. Exterior hose bibs shall be provided at new buildings and plazas to wash down walks, loading docks and drives if irrigation system cannot provide this function. Recessed wall box type with loose key stop and vacuum breaker shall be used on buildings.

E. Do not allow piping to contact gypsum board at any point. Provide a minimum ½ inch clearance.

F. Arrange system for complete drainage with ¾ inch hose end gate valves at low points.

G. Domestic water lines in sound-rated construction shall be insulated using Acousto-plumb, Elmdor Trisolator series 400/500 or equal.

3.6 JOINT CONSTRUCTION

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for basic piping joint construction.

B. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

C. Brazed joint: 1100 degree F melting point alloy with minimum 5% silver.

3.7 WATER HAMMER ARRESTERS

A. Water hammer arresters shall be provided on both hot and cold water lines serving fixtures and equipment using flushometer valves or quick-closing valves. One water hammer arrester may serve more than one fixture. These devices must be installed in the upright position. Where utility access has not been provided, access panels shall be provided for access to maintain these devices.

B. At solenoid valves, make-up valves, washers, and flush valves or any other quick closing device,

provide a diaphragm type shock absorber.

C. Size and locate in accordance with Plumbing and Drainage Institute Manual WH-201. Show location on shop drawings and PDI size of water hammer arresters required.

3.8 CROSS CONNECTION

A. Cross connection is any connection or arrangement of piping between two otherwise separate piping systems, one of which contains potable water and the other non-potable water or industrial fluids of questionable safety. Cross connection may cause non-potable fluid to enter the potable water system by backflow, back pressure, or back siphonage, and this shall not be allowed.

B. Refer to approved backflow prevention device list in Section 22 16 00 - Plumbing Specialties

C. Locate reduced pressure backflow prevention devices so that they are accessible for testing and maintenance. Provide for an adequate drainage system near each device. Each device shall be located on a wall approximately 42” above the floor with 1’ clearance from walls (confirm with the current code). If reduced pressure device is installed more than 5’-0” above floor or grade, then a platform must be provided to test the device.

D. Provide atmospheric vacuum breakers for service sinks.

E. Backflow preventers shall be tested. Test Reports shall be submitted before Substantial Completion.

3.9 VALVE INSTALLATION

A. Install sectional valve close to water main on each branch and riser serving plumbing fixtures or equipment. Use ball valves for piping NPS 3 inches and smaller. Use butterfly or gate valves for piping NPS 3-1/2 inches and larger.

B. Install shutoff valve on each water supply to equipment and on each water supply to plumbing fixtures without supply stops. Use ball valves for piping NPS 3 inches and smaller. Use butterfly or gate valves for piping NPS 3-1/2 inches and larger.

C. Install drain valves for equipment, at base of each water riser, at low points in horizontal piping, and where required to drain water piping.

1. Install hose-end drain valves at low points in water mains, risers, and branches.
2. Install stop-and-waste drain valves where indicated.

D. Install calibrated balancing valves in each hot-water circulation return branch and discharge side of each pump and circulator. Set calibrated balancing valves partly open to restrict but not stop flow.

3.10 HANGER AND SUPPORT INSTALLATION

A. Refer to Section 23 05 48 - Mechanical Sound and Vibration Control for sound and vibration devices

B. Refer to Section 23 05 29 - Hangers and Supports for pipe hanger and support devices. Install the following:

1. Vertical Piping: MSS Type 8 or Type 42, clamps.

2. Individual, Straight, Horizontal Piping Runs: According to the following:

   a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.

3. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Install supports according to Section 23 05 29 - Hangers and Supports

D. Support vertical piping and tubing at base and at each floor.

3.11 FIELD QUALITY CONTROL

A. Inspect domestic water piping as follows:

1. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.
2. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:

   a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
   b. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

3. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.
4. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

B. Test domestic water piping as follows:

1. Provide permanent isolation valves to separate new and existing piping during testing.
2. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
3. Leave uncovered and unconcealed new, altered, extended, or replaced domestic water piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
4. Cap and subject piping to hydrostatic water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials (minimum of 150 psig). Isolate test source and allow to stand for eight hours. Leaks and loss in test pressure constitute defects that must be repaired.
5. Repair leaks and defects with new materials and retest piping or portion thereof until satisfactory results are obtained.
6. Prepare reports for tests and required corrective action.

3.12 ADJUSTING

A. Adjust balancing valves in hot-water-circulation return piping to provide adequate flow.

1. Manually adjust ball-type balancing valves in hot-water-circulation return piping to provide flow of hot water in each branch.
2. Adjust calibrated balancing valves to flows indicated.
3. Close drain valves, hydrants and hose bibs.
4. Open shutoff valves to proper setting.

5. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
6. Remove and clean strainer screens. Close drain valves and replace drain plugs.
7. Check plumbing specialties and verify proper settings, adjustments and operation.

3.13 CLEANING

A. Clean and disinfect service entrance piping and domestic water piping as follows:

1. Purge new piping and parts of existing water piping that have been altered, extended, or repaired before using.
2. Use purging and disinfecting procedure prescribed by authorities having jurisdiction or, if method is not prescribed, procedure described in either AWWA C651 or AWWA C652 or as described below:

    a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    b. Fill and isolate system according to either of the following:

        1) Fill system or part thereof with water/chlorine solution with at least 50 ppm of chlorine. Isolate with valves and allow to stand for 24 hours.
        2) Fill system or part thereof with water/chlorine solution with at least 200 ppm of chlorine. Isolate and allow to stand for 3 hours.

    c. Flush system with clean, potable water until chlorine is no longer in water coming from system after the standing time.
    d. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedure if biological examination shows contamination.

B. Prepare and submit reports for purging and disinfecting activities.

C. Clean interior of piping system. Remove dirt and debris as work progresses.

3.14 COMMISSIONING

A. Fill water piping. Check components to determine that they are not air bound and that piping is full of water.

B. Perform the following steps before putting into operation:

1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Remove plugs used during testing of piping and plugs used for temporary sealing of piping during installation.
5. Remove and clean strainer screens. Close drain valves and replace drain plugs.
6. Check plumbing equipment and verify proper settings, adjustments, and operation. Do not operate water heaters before filling with water.

END OF SECTION 22 11 16

SECTION 22 13 16 - SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These Plumbing provisions specified herein apply to all Sections of Division 22.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 22.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Soil and waste, sanitary drainage and vent piping inside the building

B. Related Section

1. Section 01 91 00 – Commissioning
2. Section 22 16 00 – Plumbing Specialties
3. Section 23 00 10 – Mechanical General Provisions
4. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. ASTM A74 – Standard Specification for Cast Iron Soil Pipe and Fittings

B. ASTM A888 – Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications

C. ASTM C564 – Standard for Rubber Gaskets for Cast Iron Soil Pipe and Fittings

D. ASTM C1277 – Standard Specification for Shielded Couplings Joining Hubless Cast Iron Soil Pipe and Fittings

E. ASTM A666 – Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar

F. ANSI/ASME B16.18 – Cast Copper Alloy Solder Joint Pressure Fittings

G. ANSI/ASME B16.22 – Wrought Copper and Copper Alloy Solder Joint Pressure Fittings

H. ANSI/ASME B16.24 – Bronze Pipe Flanges and Flanged Fittings

I. ANSI/ASTM B88 – Seamless Copper Water Tube

J. MSS SP-123 – Non Ferrous Threaded and Solder Joint Unions for Use with Copper Water Tube

K. ASTM D2665 – Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic, Drain, Waste and

Vent Pipe and Fittings

L. ASTM D3311 – Standard Specification for Drain, Waste and Vent (DWV) Plastic Fittings Patterns

M. ASTM F409 – Standard Specification for Thermoplastic Accessible and Replaceable Plastic Tube and Tubular Fittings

1.4 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Piping and fitting materials	R			R
Primer, solvent, cement	R			
Solder	R			
Couplings	R			

C. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

1.5 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 14, "Plastics Piping Systems Components and Related Materials," for plastic piping components. Include marking with "NSF-dwv" for plastic drain, waste, and vent piping; "NSF-drain" for plastic drain piping; "NSF-tubular" for plastic continuous waste piping; and "NSF-sewer" for plastic sewer piping.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

B. Flexible Transition Couplings for Underground Nonpressure Piping: ASTM C 1173 with elastomeric sleeve. Include ends of same sizes as piping to be joined and include corrosion-resistant metal band on each end.

C. Transition Couplings for Underground Pressure Piping: AWWA C219 metal, sleeve-type coupling or

other manufactured fitting same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

D. Waste pipes larger than 1¼ inch diameter shall be supported with Elmdor Trisolator series 400/500 or equal, resilient attachments.

E. Waste pipe clamps in vertical runs shall be isolated using Mason SWM or equal, neoprene resilient pads.

F. Copper drain pipe wrapping shall be pipe-wrap tape by Lowry or equal.

2.2 CAST-IRON SOIL PIPING

A. Below Ground Hub-and-Spigot Pipe and Fittings: ASTM A 74, Service class.

1. Gaskets: ASTM C 564, rubber.

B. Above Ground Hubless Pipe and Fittings: ASTM A 888 or CISPI 301.

1. Couplings: ASTM C 1277 assembly of metal housing, corrosion-resistant fasteners, and ASTM C 564 rubber sleeve with integral, center pipe stop.

a. Heavy-Duty, Type 304, Stainless-Steel Couplings: ASTM A 666, Type 304, stainless-steel shield; stainless-steel bands; and sleeve similar to Husky 4000.

(1) NPS 1-1/2 to NPS 4: 3-inch wide shield with 4 bands.
(2) NPS 5 to NPS 10: 4-inch wide shield with 6 bands.

2.3 COPPER TUBING

A. Hard Copper Tube: ASTM B 88, Types L and M (ASTM B 88M, Types B and C), water tube, drawn temper.

1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end.
3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

2.4 PVC PIPE AND FITTINGS

A. PVC Pipe: ASTM D 2665, Schedule 40, solid-wall drain, waste, and vent

1. PVC Socket Fittings: ASTM D 2665, socket type, made to ASTM D 3311, drain, waste, and vent patterns.

B. PVC Special Fittings: ASTM F 409, drainage-pattern tube and tubular fittings with ends as required for application.

C. PVC Schedule 40 DWV Foam Core pipe (ASTM F891) is unacceptable.

2.5 ENCASEMENT FOR UNDERGROUND METAL PIPING

A. Description: ASTM A 674 or AWWA C105, high-density, cross-laminated PE film of 0.004-inch minimum thickness.

B. Form: tube.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. See Section 23 08 00 - Mechanical Commissioning

3.2 EXCAVATION

A. Refer to Division 02 for excavating, trenching and backfilling.

3.3 PIPING APPLICATIONS

A. Transition and special fittings with pressure ratings at least equal to piping pressure ratings may be used in applications below, unless otherwise indicated.

B. Flanges may be used on aboveground pressure piping, unless otherwise indicated.

C. Aboveground, Soil, Waste, and Vent Piping: Use any of the following piping materials for each size range:

1. NPS 1-1/4 and NPS 1-1/2: Copper DWV tube, copper drainage fittings, and soldered joints.
2. NPS 1-1/4 and NPS 1-1/2: PVC pipe, PVC socket fittings, and solvent-cemented joints.
3. NPS 1-1/4 and NPS 1-1/2: Hubless, cast-iron soil piping and the following:

    a. Couplings: Heavy-duty, Type 304, stainless steel.

4. NPS 2 to NPS 4: PVC pipe, PVC socket fittings, and solvent-cemented joints.
5. NPS 2 to NPS 4: Service class, cast-iron soil piping; gaskets; and gasketed joints.
6. NPS 2 to NPS 4: Hubless, cast-iron soil piping and one of the following:

    a. Couplings: Heavy-duty, Type 304, stainless steel similar to Husky 4000.

7. NPS 5 to NPS 6: PVC pipe, PVC socket fittings, and solvent-cemented joints.
8. NPS 5 and NPS 6: Service class, cast-iron soil piping; gaskets; and gasketed joints.
9. NPS 5 and NPS 6: Hubless, cast-iron soil piping and one of the following:

    a. Couplings: Heavy-duty, Type 304, stainless steel similar to Husky 4000.

D. Underground, Soil, Waste, and Vent Piping: Use the following piping materials for each size range:

1. NPS 2 and larger: PVC pipe, PVC socket fittings, and solvent-cemented joints.
2. NPS 2 and larger: Service class, cast-iron soil piping; gaskets; and gasketed joints or

Hubless, cast-iron soil piping and one of the following:

a. Couplings: Heavy-duty, Type 304, stainless steel similar to Husky 4000.

E. Indirect drain piping including cooling coil condensate drain: Use the following piping materials for each size range:

1. NPS 3/4 to NPS 4: Hard copper tube, Type L; wrought copper pressure fittings; and soldered joints.

3.4 PIPING INSTALLATION

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for basic piping installation.

B. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers.

C. Install cleanout fitting with closure plug inside the building in sanitary force-main piping.

D. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Refer to Section 23 05 00 Basic Mechanical Materials and Methods for sleeves and mechanical sleeve seals.

E. Install wall penetration system at each service pipe penetration through foundation wall. Make installation watertight. Refer to Section 23 05 00 Basic Mechanical Materials and Methods for wall penetration systems.

F. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Encase underground piping with PE film according to ASTM A 674 or AWWA C105.

G. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if 2 fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

H. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.

I. Install soil and waste drainage and vent piping at the following minimum slopes, unless otherwise indicated:

1. Building Sanitary Drain: 2 percent downward in direction of flow for piping NPS 3 and smaller; 1 percent downward in direction of flow for piping NPS 4 and larger.
2. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.

J. Install engineered soil and waste drainage and vent piping systems in locations indicated and as

follows:

1. Combination Waste and Vent: Comply with standards of authorities having jurisdiction.
2. Reduced-Size Venting: Comply with standards of authorities having jurisdiction.

K. Sleeves are not required for cast-iron soil piping passing through concrete slabs-on-grade if slab is without membrane waterproofing.

L. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

M. Do not allow piping, plumbing or vent stacks to contact gypsum board at any point. Provide a minimum 1½ inch clearance.

3.5 JOINT CONSTRUCTION

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for basic piping joint construction.

B. Cast-Iron, Soil-Piping Joints: Make joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Gasketed Joints: Make with rubber gasket matching class of pipe and fittings.
2. Hubless Joints: Make with rubber gasket and sleeve or clamp.

C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

D. PVC Nonpressure Piping Joints: Join piping according to ASTM D2665

3.6 VALVE INSTALLATION

A. Refer to Section 23 05 23 - Valves for general-duty valves.

B. Backwater Valves: Install backwater valves in piping subject to sewage backflow.

1. Horizontal Piping: Horizontal backwater valves.
2. Floor Drains: Drain outlet backwater valves, unless drain has integral backwater valve.
3. Install backwater valves in accessible locations.
4. Refer to Section 22 16 00 - Plumbing Specialties for backwater valves.

3.7 HANGER AND SUPPORT INSTALLATION

A. Refer to Section 23 05 29 - Hangers and Supports for pipe hanger and support devices. Install the following:

1. Vertical Piping: MSS Type 8 or Type 42, clamps.
2. Individual, Straight, Horizontal Piping Runs: According to the following:

   a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
   b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
   c. Longer Than 100 Feet, if Indicated: MSS Type 49, spring cushion rolls.

3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
4. Base of Vertical Piping: MSS Type 52, spring hangers.

B. Install supports according to Section 23 05 29 - Hangers and Supports

C. Support vertical piping and tubing at base and at each floor.

D. Rod diameter may be reduced 1 size for double-rod hangars, with 3/8-inch minimum rods.

E. Comply with International Plumbing Code or local plumbing codes where more stringent than the requirements of this section.

F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:

1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
2. NPS 3: 60 inches with 1/2-inch rod.
3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
4. Spacing for 10-foot lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches.

G. Install supports for vertical cast-iron soil piping every 15 feet.

H. Install supports for vertical steel piping every 15 feet.

I. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:

1. NPS 1-1/4: 72 inches with 3/8-inch rod.
2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
3. NPS 2-1/2: 108 inches with 1/2-inch rod.
4. NPS 3 to NPS 5: 10 feet with 1/2-inch rod.

J. Install supports for vertical copper tubing every 10 feet.

K. Install hangers for PVC piping with the following maximum horizontal spacing and minimum rod diameters:

1. NPS 1-1/4 to NPS 2: 48 inches with 3/8-inch rod.
2. NPS 3: 48 inches with 1/2-inch rod.
3. NPS 4 and NPS 5: 48 inches with 5/8-inch rod.
4. NPS 6: 48 inches with 3/4-inch rod.

L. Install supports for vertical PVC piping every 48 inches.

M. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.8 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect drainage and vent piping to the following:

1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code. Refer to Section 22 40 00 - Plumbing Fixtures
2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code. Refer to Section 22 16 00 - Plumbing Specialties
4. Equipment: Connect drainage piping as indicated. Provide shutoff valve, if indicated, and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.

3.9 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.

1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test sanitary drainage and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
3. Roughing-in Plumbing Test Procedure: Test drainage and vent piping, except outside leaders, on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 4 hours before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg. Use U-tube or manometer inserted in trap of water closet to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
6. Prepare reports for tests and required corrective action.

3.10 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

END OF SECTION 22 13 16

SECTION 22 15 00 – COMPRESSED-AIR EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These Plumbing provisions specified herein apply to all Sections of Division 22.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 22.

1.2 SUMMARY

A. This Section includes equipment and accessories for building compressed-air systems operating at

1. 200 psig and less.

B. Related Sections include the following:

1. Section 22 15 13 – Compressed Air Piping
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods
4. Section 23 05 53 – Mechanical System Identification

1.3 DEFINITIONS

A. Low-Pressure, Compressed-Air Systems: ASME B31.9, "Building Services Piping," for systems operating at pressure of 125 psig or less and at temperature of 200 deg F or less.

1.4 SUBMITTALS

A. Product Data: For each model indicated. Include rated capacities of air compressors, aftercoolers, air dryers, and accessories; shipping, installed, and operating weights; furnished specialties; and accessories. Indicate dimensions, required clearances, methods of assembly of components, and piping and wiring connections.

B. Wiring Diagrams: For each item of equipment with electric power supply. Include ladder-type wiring diagrams for interlock and control wiring required for final installation. Differentiate between factory-installed and field-installed wiring.

C. Coordination Drawings: For compressed-air equipment and piping, including relationship to other services that serve same work areas.

D. Certificates of Shop Inspection and Data Report: As required by ASME Boiler and Pressure Vessel Code.

E. Maintenance Data: For equipment to include in the maintenance manuals specified in Division 15.

1.5 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of compressed-air equipment and accessories and are based on specific types and models indicated. Other products with equal performance characteristics, made by specified manufacturers, may be considered. Refer to Division 1 Section "Substitutions and Product Options".

B. Electrical Component Standard: NFPA 70.

C. Provide listing/approval stamp, label, or other marking on equipment made to specified standards.

D. Listing and Labeling: Provide equipment and accessories specified in this Section that are listed and labeled.

1. Terms "Listed" and "Labeled": As defined in National Electrical Code, Article 100.
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver and store equipment and large accessories on factory-installed shipping skids and small accessories in factory-fabricated fiberboard containers.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Pressure-Lubricated, Reciprocating Air Compressors:

a. Champion
b. Gardner Denver
c. Ingersoll-Rand

2. Aftercoolers, Air Cooled:

a. Arrow Pneumatics, Inc.
b. Curtis-Toledo, Inc.
c. Hankison International.
d. Ingersoll-Rand Co.; Rotary-Reciprocating Compressor Div.
e. Saylor-Beall Manufacturing Co.
f. Van Air Systems, Inc.
g. Zeks Air Drier Corp.

3. Refrigerated Air Dryers:

a. Champion
b. Gardner Denver

c. Ingersoll-Rand

2.2 AIR COMPRESSORS

A. General: Factory-assembled and -tested packaged units; duplex; and with the following capacities, features, and electrical characteristics;

1. Model: Champion HR5D-12
2. Two, 5.0 HP, 208V, 3 phase high efficiency motor driven compressors.
3. 120 Gallon horizontal ASME stamped receiver.
4. 41.4 cfm displacement; 34.6 cfm delivery at 175 psi.

B. Construction of Equipment: ASME B19.1, "Safety Standard for Air Compressor Systems"; or ASME B19.3, "Safety Standard for Compressors for Process Industries," as appropriate.

C. Control Panels: Automatic control station with load control and protection functions. Comply with NEMA ICS 2, "Industrial Controls and Systems: Controllers, Contactors and Overload Relays, Rated Not More than 200 Volts AC or 750 Volts DC"; and UL 508, "Industrial Control Equipment."

1. Mounting and Wiring: Factory installed and connected as an integral part of equipment package.
2. Enclosure: NEMA ICS 6, "Industrial Control and Systems: Enclosures," Type 12 control panel, except where a higher degree of enclosure is specified.
3. Motor Controllers: Full-voltage, combination-magnetic type with undervoltage release feature and motor-circuit-protector-type disconnect and short-circuit protective device.

    a. Control Voltage: 120 V, ac or less, using integral control power transformer.
    b. Motor Overload Protection: Overload relay in each phase.
    c. Starting Devices: Hand-off-automatic selector switch in cover of control panel, plus pilot device for automatic control as indicated.

4. Instrumentation: Include air-receiver pressure gage, discharge-line pressure gage, air-filter maintenance indicator, hour meter, compressor discharge air and coolant temperature gage, and control transformer.

D. Receiver Tanks: ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels" construction and bear appropriate code symbols, with pressure gage, pressure-reducing valve, and automatic drain.

E. Factory Prepiping: Entire unit, except where otherwise indicated.

2.3 SAFETY VALVES

A. Safety Valves: Poppet type complying with ASME Boiler and Pressure Vessel Code, Section VIII, bear appropriate labeling, and factory sealed after testing.

2.4 RECIPROCATING AIR COMPRESSORS

A. Description: Horizontal tank-mounted, splash lubricated, belt driven, duplex reciprocating air compressors, each with inlet silencer filter, safety valve, discharge pressure gage, pressure

regulator, and shutoff valve, low oil sensing switch and low oil pressure shut down switch. Include vibration isolation pads.

B. Receiver Tank Orientation: Horizontal.

2.5 AFTERCOOLERS

A. Aftercoolers, Air-Cooled: Tubular, rated at 250 psig and leak tested at 350-psig minimum air pressure, in capacities indicated. Size units to cool compressed air in compressor-rated capacities to 20 deg F above summertime maximum ambient temperature.

2.6 ACCESSORIES

A. General: Include accessories with working-pressure rating not less than system pressure at location where used, and compatible with equipment and piping system used.

B. Intercoolers: Air-cooled, fixed-bundle, tubular intercoolers, rated at 250psig and leak tested at 350-psig minimum air pressure, in capacities indicated. Size units to cool compressed air in compressor-rated capacities to 20 deg F above summertime maximum ambient temperature.

C. Receivers: ASME stamped; cylindrical, horizontal installation as indicated; galvanized steel; with safety valves in sizes, working pressures, and temperatures indicated, and with drain connection.

1. Pressure Rating: Not less than maximum discharge pressure.

2.7 SPECIALTIES

A. Safety Valves: ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels" construction, National Board certified, labeled, and factory sealed; constructed of bronze body with poppet safety valve for compressed-air service.

1. Pressure Settings: Higher than discharge pressure and same or lower than receiver pressure rating.

B. Automatic Drain Valves: Corrosion-resistant metal body and internal parts, rated for 200-psig minimum working pressure, capable of automatic discharge of collected condensate.

C. Pressure Regulators: Bronze body, direct acting, spring loaded, manual pressure setting adjustment and rated for 250-psig (1725-kPa) inlet pressure, except where otherwise indicated.

D. Filters: 2-stage, mechanical-separation type, air-line filters in sizes and ratings indicated. Equip with deflector plates; resin-impregnated-ribbon-type filters with edge filtration, 40 micron thick; and drain cock.

E. Coalescing Filters: Capacities and types indicated. Equip with activated carbon capable of removing water and oil aerosols, with color-change dye to indicate when carbon is saturated and warning light to indicate when selected maximum pressure drop has been exceeded.

2.8 REFRIGERATED AIR DRYER, NON-CYCLING

A. General: Factory assembled and tested package unit. Performance data shall be obtained using methods complying fully with CAGI Standard No. ADF100- "Refrigerated Compressed Air Dryers - Methods for Testing and Rating" and National Fluid Power Association (NFPA) Standard NFPA T3.27.2.

B. Basis of Design: Champion CRN-35A1.

Capacity:	scfm	35
	EAT	250°Fdb
	LAT	50°F (dewpoint)
	Pressure	175 psi
	Ambient Air	130°Fdb
	Max. P.D.	5.0 psi (total filter and dryer)
	Motor	0.5HP, 115 VAC, single phase

C. Instrumentation: Include trap, refrigerant analyzes gauge, on-off switch, power "on" light, high inlet temperature light, air outlet pressure gauge, dew point temperature bar graph indicator.

D. Accessories: Include ambient air filter and Type "F" vibration isolators.

PART 3 - EXECUTION

3.1 CONCRETE BASES

A. Install concrete bases of dimensions indicated for air compressors and accessories. Refer to Division 3 Section "Cast-in-Place Concrete" and Section 23 05 00 - Basic Mechanical Materials and Methods.

3.2 EQUIPMENT INSTALLATION

A. Installation of Equipment: Comply with ASME B19.1 or ASME B19.3 as appropriate.

B. Install air compressors, intercoolers, aftercoolers, air-receiver tanks, and dryers on concrete bases. Set and connect units according to manufacturers' written instructions. Install units plumb, level, and firmly anchored in locations indicated. Maintain manufacturers' recommended clearances. Orient so equipment, controls, and devices needing service are accessible.

C. Anchor air compressors, receivers, and other equipment to substrate.

D. Support air compressors using vibration-control devices.

1. Install tank-mounted compressors, more than 5 hp, with concrete inertia base and spring isolators.

E. Install accessories and specialties as indicated. Set and connect units according to manufacturers' written instructions. Install units plumb, level, and firmly anchored in locations indicated. Maintain manufacturers' recommended clearances. Orient so controls needing service are accessible.

3.3 INSTALLATION OF BASIC IDENTIFICATION

A. Install mechanical identification in accordance with Section 23 05 53.

3.4 CONNECTIONS

A. Install piping next to equipment and accessories to allow service and maintenance.

B. Connect air piping to equipment and accessories with unions and shutoff valves. Install with strainers where indicated.

1. Install thermometers on compressor discharge piping, on receiver tanks, and where indicated.
2. Install pressure gages on compressor discharge piping, on receiver tanks, and where indicated.
3. Install safety valves in receiver tanks, in quantity and size to relieve capacity not less than that of connected compressor.
4. Install automatic drain valves on intercoolers, aftercoolers, separators, receivers, dryers, and other locations indicated. Discharge condensate over nearest floor drain.
5. Install accessories as indicated.
6. Ground equipment.

    a. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

7. Arrange for electric-power connections to equipment that requires power. Electric power, wiring, and disconnect switches are specified in Division 16 Sections.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Provide services of a factory-authorized service representative to supervise the field assembly of components and installation of equipment, including piping and electrical connections, and to report results in writing.

B. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.6 COMMISSIONING

A. Perform the following final checks before startup:

1. Verify that specified tests of piping systems are completed.
2. Check for piping connection leaks.
3. Check for lubricating oil in lubricated-type equipment.
4. Check V belts for proper tension.
5. Check that compressor inlet filters and piping are clear.
6. Check for equipment vibration-control supports and flexible pipe connectors and that equipment is properly attached to substrate.
7. Check safety valves for correct settings. Ensure settings are greater than air-compressor discharge pressure, but not greater than rating of system components.
8. Test operation of equipment safety controls and devices.

9. Drain receiver tanks.
10. Check for adequate room ventilation.

B. Starting Procedures: Follow manufacturer's written instructions. If no instructions are prescribed by manufacturer, proceed as follows:

1. Energize circuits.
2. Start and run equipment through complete sequence of operations.
3. Check for excessive vibration and noise. Correct problems.
4. Check air pressures.
5. Manually operate safety valves.
6. Adjust operating controls, including pressure settings.

C. Operate and adjust operating and safety controls. Replace damaged and malfunctioning controls and equipment discovered by service representative.

3.7 DEMONSTRATION

A. Startup Services: Engage a factory-authorized service representative to perform startup services and to demonstrate and Using Agency's maintenance personnel as specified below.

1. Train Using Agency's maintenance personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, and preventive maintenance. Refer to Section 23 00 10 – Mechanical General Provisions
2. Review data in the operation and maintenance manuals. Refer to Section 23 00 10 – Mechanical General Provisions

END OF SECTION 22 15 00

SECTION 22 15 13 - COMPRESSED-AIR PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These Plumbing provisions specified herein apply to all Sections of Division 22.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 22.

1.2 SUMMARY

A. This Section includes piping and specialties for building compressed-air systems operating at 200 psig and less.

B. Related Sections include the following:

1. Section 22 15 00 – Compressed Air Equipment
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods
4. Section 23 05 53 – HVAC System Identification

1.3 DEFINITIONS

A. Low-Pressure, Compressed-Air Piping: ASME B31.9, "Building Services Piping," for piping operating at pressure of 125 psig or less and at temperature of 200 deg F or less.

B. PTFE: Polytetrafluoroethylene.

1.4 SUBMITTALS

A. Coordination Drawings: For compressed-air equipment and piping, including relationship to other services that serve same work areas.

1.5 QUALITY ASSURANCE

A. Provide listing/approval stamp, label, or other marking on equipment made to specified standards.

B. Listing and Labeling: Provide equipment and accessories specified in this Section that are listed and labeled.

1. Terms "Listed" and "Labeled": As defined in National Electrical Code, Article 100.
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Compressed-Air, General-Duty Valves:

a. Conbraco Industries, Inc.; Apollo Div.
b. Crane Co.; Valve Div.
c. Grinnell Corp.
d. Hammond Valve.
e. Milwaukee Valve Co., Inc.
f. Nibco, Inc.
g. Stockham Valves & Fittings, Inc.

2. Compressed-Air-Service, Locking-Handle, Safety-Exhaust Valves:

a. Conbraco Industries, Inc.; Apollo Div.
b. Hammond Valve.
c. Milwaukee Valve Co., Inc.
d. Nibco, Inc.

3. Quick Connect/Disconnect Hose Couplings:

a. Aeroquip Corp.; Industrial Products Group.
b. Bowes Manufacturing, Inc.
c. DeVilbiss Air Compressor Products.
d. Foster Manufacturing Co., Inc.
e. Milton Industries, Inc.
f. OBAC Corp.
g. Parker Hannifin Corp.; Quick Coupling Div.
h. Schrader, Inc.
i. Snap-Tite, Inc.
j. Tuthill Corp.; Hansen Coupling Div.

2.2 PIPING, GENERAL

A. ASME Code Compliance: Provide compressed-air piping components complying with ASME B31.9, "Building Services Piping."

B. ASME Code Compliance: Provide compressed-air piping components complying with the following:

1. Low-Pressure, Compressed-Air Piping: ASME B31.9, "Building Services Piping."

2.3 PIPING

A. Steel Pipe: ASTM A 53, Type E, Electric-Resistance Welded or Type S, Seamless, Grade B, Schedule 40, black or hot dipped, zinc coated.

2.4 PIPE FITTINGS

A. Malleable-Iron Pipe Fittings: ASME B16.3, Class 150, threaded, plain or galvanized.

B. Malleable-Iron Pipe Unions: ASME B16.39, Class 150, threaded.

C. Wrought-Steel Pipe Fittings: ASME B16.9, Schedule 40, butt welding.

D. Forged-Steel Pipe Fittings: ASME B16.11, socket type.

E. Steel Pipe Flanges: ASME B16.5, Classes 150 and 300, carbon steel.

2.5 JOINING MATERIALS

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for joining materials not in this Section.

2.6 VALVES

A. General-Duty Valves: Refer to Section 23 05 23 Valves for compressed-air-service valves not specified in this Section and for valves for other fluids.

B. Special-Duty, Compressed-Air Valves: Include PTFE seats and comply with the following:

1. Ball Valves, 2-Inch NPS and Smaller: MSS SP-110; 2-piece bronze body with blowout-proof stem; regular or full port; chrome-plated, solid-brass or -bronze ball; threaded ends; and 600-psig minimum WOG pressure rating.
2. Butterfly Valves, 2-1/2-Inch NPS and Larger: MSS SP-67; Type I (bubble tight); single-flange (lug-type), cast-iron body with ductile-iron disc, and 200-psig minimum WOG pressure rating.
3. Check Valves, 2-Inch NPS and Smaller: MSS SP-80; Type 4 or nonstandard T-pattern, swing check; Class 125, bronze body with composition-to-metal seat and threaded ends.
4. Check Valves, 2-1/2-Inch NPS and Larger: MSS SP-71, Type II full-waterway or Type IV clear-waterway, cast-iron body with composition-to-metal seat and flanged ends.
5. Globe Valves, 2-Inch NPS and Smaller: MSS SP-80, Class 125, Type 2, bronze body with composition-to-metal seat and threaded ends.

2.7 SPECIALTIES

A. Safety Valves: ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels" construction, National Board certified, labeled, and factory sealed; constructed of bronze body with poppet safety valve for compressed-air service.

1. Pressure Settings: Higher than discharge pressure and same or lower than receiver pressure rating.
2. Pressure Regulators: Bronze body, direct acting, spring loaded manual pressure-setting adjustment, and rated for 250-psig, except where otherwise indicated.

    a. Type: Diaphragm operated.

3. Pressure Regulators: Aluminum alloy or plastic body, diaphragm operated, direct acting, spring loaded, manual pressure-setting adjustment, and rated for 250 psig inlet pressure, except where otherwise indicated.
4. Filters: 2-stage, mechanical-seperation type, air-line filters in sizes and ratings indicated. Equip with deflector plates; resin-impregnated-ribbon-type filters with edge filtration, 40 micron thick; and drain cock.

5. Coalescing Filters: Capacities and types indicated. Equip with activated carbon capable of removing eater and oil aerosols, with color-change dye to indicate when carbon is saturated and warning light to indicate when selected maximum pressure drop has been exceeded.
6. Automatic Drain Valves: Corrosion-resistant metal body and internal parts, rated for 200-psig minimum working pressure, capable of automatic discharge of collected condensate.
7. Hose, Clamps and Couplings: Provide compatible hose, hose clamps, and hose couplings, suitable for compressed-air service, of nominal diameter, and rated for 300-psig minimum working pressure, except where otherwise indicated.

    a. Quick Connect/Disconnect Hose Couplings: One-way, automatic shutoff, brass body, with O-ring or gasket seal, and stainless steel or nickel-plated steel operating parts. Select socket end with threaded inlet that is considered the fixed end and has one-way valve.
    b. Hose Adapter Couplings: One-piece, brass or stainless-steel fitting, with serrated ends.
    c. Hose: Reinforced, single or double-braid, neoprene-covered hose for compressed air service.
    d. Hose Clamps: Stainless steel, clamps, bands, or wire.

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS

A. ASME Code Compliance: Provide compressed-air piping components complying with ASME B31.9, "Building Services Piping."

B. ASME Code Compliance: Provide compressed-air piping components complying with the following:

    1. Low-Pressure, Compressed-Air Piping: ASME B31.9, "Building Services Piping."

C. Install flanges, unions, transition and special fittings, and valves with pressure ratings same or higher than system pressure rating used in applications below, except where otherwise specified.

D. Low-Pressure, Compressed-Air, Distribution Piping: Use the following:

1. 2-Inch NPS and Smaller: Black steel pipe; threaded, malleable-iron fittings; and threaded joints.
2. 2-1/2- to 4-Inch NPS: Black steel pipe; threaded, malleable-iron fittings; and threaded joints.

3.2 VALVE APPLICATIONS

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Shutoff Duty: Use ball or butterfly valves.
2. Throttling Duty: Use globe or butterfly valves.
3. Compressed-Air Supply to Equipment: Locking-handle, safety-exhaust ball valves.
4. Do not use check valves in piping between reciprocating air compressors and air receivers.

3.3 PIPING INSTALLATION, GENERAL

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for basic piping installation.

B. Install air and drain piping with one percent slope downward in direction of airflow.

C. Install eccentric reducers where pipe is reduced in size in direction of airflow, with bottoms of both pipes and reducer flush.

D. Connect branch air piping to mains from top of main. Provide drain leg and drain trap at end of each main, branch, and low point in piping.

E. Install supports and anchors according to Section 23 05 00 - Basic Mechanical Materials and Methods. Do not exceed the following spacing between pipe hangers:

F. Steel Pipe: 12 feet horizontal and 15 feet vertical.

G. Install valves according to Section 23 05 23 – Valves.

H. Install expansion joints and anchors according to Division 15 Section "Basic Mechanical Materials and Methods".

I. Install thermometers and pressure gages according to Section 23 05 16 – Piping Specialties

J. Install plumbing specialties according to Section 22 16 00 - Plumbing Specialties

3.4 JOINT CONSTRUCTION

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping joint

construction.

B. Dissimilar Material Piping Joints: Make joints using adapters compatible with both piping materials.

3.5 INSTALLATION OF BASIC IDENTIFICATION

A. Install mechanical identification in accordance with Section 23 05 53.

B. Paint all exposed piping with two coats of specified paint, color shall be selected by the Professional. See Section 09 90 00 – Painting – Non VOC Paint and Section 23 00 10 – Mechanical General Provisions.

3.6 CONNECTIONS

A. Install piping next to equipment and accessories to allow service and maintenance.

B. Connect air piping to equipment and accessories with unions and shutoff valves. Install with strainers where indicated.

C. Install safety valves in receiver tanks, in quantity and size to relieve capacity not less than that of connected compressor.

D. Install automatic drain valves on intercoolers, aftercoolers, separators, receivers, dryers, and other locations indicated. Discharge condensate over nearest floor drain.

E. Install specialties as indicated.

3.7 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Provide services of a factory-authorized service representative to supervise the field assembly of components and piping, and to report results in writing.

B. Test and adjust piping safety controls. Replace damaged and malfunctioning controls.

C. Piping System Tests: Test new piping. Cap and fill compressed-air piping with oil-free, dry air, or gaseous nitrogen to pressure of 50 psig (345 kPa) above system operating pressure, but not less than 150 psig (1035 kPa). Isolate test source and let stand for 4 hours to equalize temperature. Refill system, if required, to test pressure and hold pressure for 2 hours with no drop in pressure.

1. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.

3.8 COMMISSIONING

A. Perform the following final checks before startup:

1. Verify that specified tests of piping are completed.
2. Check for piping connection leaks.
3. Check for lubricating oil in lubricated-type equipment.
4. Check V belts for proper tension.
5. Check that compressor inlet filters and piping are clear.
6. Check for equipment vibration-control supports and flexible pipe connectors and that equipment is properly attached to substrate.
7. Check safety valves for correct settings. Ensure settings are greater than air-compressor discharge pressure, but not greater than rating of system components.
8. Test operation of equipment safety controls and devices.
9. Drain receiver tanks.
10. Check for adequate room ventilation.

B. Starting Procedures: Follow manufacturer's written instructions. If no instructions are prescribed by manufacturer, proceed as follows:

1. Energize circuits.
2. Start and run equipment through complete sequence of operations. 3. Check for excessive vibration and noise. Correct problems.
3. Check air pressures.
4. Manually operate safety valves.
5. Adjust operating controls, including pressure settings.

C. Operate and adjust operating and safety controls. Replace damaged and malfunctioning controls and equipment discovered by service representative.

END OF SECTION 22 15 13

SECTION 22 16 00 – PLUMBING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These Plumbing provisions specified herein apply to all Sections of Division 22.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 22.

1.2 SUMMARY

A. This Section includes the following plumbing specialties:

1. Backflow preventers
2. Water regulators
3. Balancing valves
4. Strainers
5. Outlet Boxes
6. Water supply outlets
7. Trap seal primer valves
8. Drain valves
9. Miscellaneous piping specialties
10. Sleeve penetration systems
11. Cleanouts
12. Floor drains
13. Floor sinks
14. Roof drains

B. Related Sections include the following:

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 05 00 – Basic Mechanical Materials and Methods
3. Section 23 05 16 – Piping Specialties

1.3 PERFORMANCE REQUIREMENTS

A. Provide components and installation capable of producing piping systems with following minimum working-pressure ratings, unless otherwise indicated:

1. Domestic Water Piping: 150 psig
2. Sanitary Waste and Vent Piping: 10-foot head of water
3. Storm Drainage Piping: 10-foot head of water

1.4 SUBMITTALS

A. Product Data: Include rated capacities and shipping, installed, and operating weights. Indicate materials, finishes, dimensions, required clearances, and methods of assembly of components; and piping and wiring connections for the following:

1. Backflow preventers and water regulators.
2. Balancing valves, water filters, and strainers.
3. Thermostatic water mixing valves and water tempering valves.
4. Water hammer arresters, air vents, and trap seal primer valves and systems.
5. Drain valves, hose bibbs, hydrants, and hose stations.
6. Outlet boxes and washer-supply outlets.
7. Backwater valves, cleanouts, floor drains, floor sinks, open receptors, trench drains, and roof drains.
8. Vent caps, vent terminals, and roof flashing assemblies.
9. Sleeve penetration systems.

B. Shop Drawings: Diagram power, signal, and control wiring

C. Field test reports

D. Maintenance Data: For plumbing specialties to include in maintenance manuals. Include the following:

1. Backflow preventers and water regulators
2. Water filters
3. Thermostatic water mixing valves and water tempering valves
4. Trap seal primer valves and systems
5. Hose stations and hydrants

E. Refer to Section 23 00 10 – Mechanical General Provisions for additional submittal requirements

1.5 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of plumbing specialties and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Plumbing specialties shall bear label, stamp, or other markings of specified testing agency.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for piping materials and installation.

E. NSF Compliance:

1. Comply with NSF 61, "Drinking Water System Components--Health Effects, Sections 1 through 9," for potable domestic water plumbing specialties.

PART 2 - PRODUCTS

2.1 BACKFLOW PREVENTERS

A. Manufacturers:

1. Ames Co., Inc.
2. Watts Industries, Inc.; Water Products Div.
3. Zurn Industries, Inc.; Wilkins Div.

B. General: ASSE standard, backflow preventers.

1. NPS 2 and Smaller: Bronze body with threaded ends.
2. NPS 2-1/2 and Larger: Bronze, cast-iron, steel, or stainless-steel body with flanged ends.

    a. Interior Lining: AWWA C550 or FDA-approved, epoxy coating for backflow preventers having cast-iron or steel body.

3. Interior Components: Corrosion-resistant materials.
4. Exterior Finish: Polished chrome plate if used in chrome-plated piping system.
5. Strainer: On inlet, if indicated.

C. Pipe-Applied, Atmospheric-Type Vacuum Breakers: ASSE 1001, with floating disc and atmospheric vent.

D. Hose-Connection Vacuum Breakers: ASSE 1011, nickel plated, with nonremovable and manual drain features, and ASME B1.20.7, garden-hose threads on outlet. Units attached to rough-bronze-finish hose connections may be rough bronze.

E. Intermediate Atmospheric-Vent Backflow Preventers: ASSE 1012, suitable for continuous pressure application. Include inlet screen and two independent check valves with intermediate atmospheric vent.

F. Reduced-Pressure-Principle Backflow Preventers: ASSE 1013, suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet; test cocks; and pressure-differential relief valve with ASME A112.1.2 air-gap fitting located between two positive-seating check valves.

1. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range.

G. Antisiphon-Pressure-Type Vacuum Breakers: ASSE 1020, suitable for continuous pressure application. Include shutoff valves, spring-loaded check valve, spring-loaded floating disc, test cocks, and atmospheric vent.

1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range.

H. Reduced-Pressure Detector Assembly Backflow Preventers: ASSE 1047, FM approved or UL listed, and suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet. Include test cocks; pressure-differential relief valve with ASME A112.1.2 air-gap fitting located between two positive-seating check valves; and bypass with displacement-type water meter, valves, and reduced-pressure backflow preventer.

1. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range.

I. Dual-Check-Valve-Type Backflow Preventers: Watts Series 7C or equal, ASSE 1024, suitable for continuous pressure application. Include union inlet and two independent check valves. BfP-1 is to be ½" NPS.

J. Double-Check-Valve-Type Backflow Prevention Assemblies: ASSE 1015, suitable for continuous pressure application. Include shutoff valves on inlet and outlet, strainer on inlet; test cocks; and two positive-seating check valves. Equal to Watts 007M2QT-S.

1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range.

K. Double-Check Detector Assembly Backflow Preventers: ASSE 1048, FM approved or UL listed, and suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet. Include test cocks; two positive-seating check valves; and bypass with displacement-type water meter, valves, and double-check backflow preventer.

1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range.

L. Hose-Connection Backflow Preventers: ASSE 1052, suitable for at least 3-gpm flow and applications with up to 10-foot head of water back pressure. Include two check valves; intermediate atmospheric vent; and nonremovable, ASME B1.20.7, garden-hose threads on outlet.

M. Back-Siphonage Backflow Vacuum Breakers: ASSE 1056, suitable for continuous pressure and backflow applications. Include shutoff valves, check valve, test cocks, and vacuum vent.

2.2 WATER REGULATORS

A. Manufacturers:

1. Watts Industries, Inc.; Water Products Div.
2. Zurn Industries, Inc.; Wilkins Div.
3. Or equal

B. General: ASSE 1003, water regulators, rated for initial working pressure on 150 psig minimum. Include integral factory installed or separate field-installed, Y-pattern strainer.

1. NPS 2 and Smaller:

a. General-Duty Service: Single-seated, direct operated, unless otherwise indicated.
b. Booster Heater Water Supply: Single-seated, direct operated with integral bypass.

2. NPS 2-1/2 and Larger:

a. Type: Single-seated, direct operated.
b. Type: Pilot-operated, single- or double-seated, cast-iron body main valve, with bronze-body pilot valve.

3. Interior Components: Corrosion-resistance materials
4. Exterior-Finish: Polished chrome plate if used in chrome-plated piping system.

2.3 BALANCING VALVES

A. Calibrated Balancing Valves: Adjustable, with two readout ports and memory setting indicator. Include manufacturer’s standard hoses, fittings, valves, differential pressure meter, and carrying case.

1. Manufacturers:

    a. Armstrong Pumps, Inc.
    b. ITT Industries; Bell & Gossett
    c. Watts Industries, Inc; Water Products Div.

2. NPS 2 and Smaller: Bronze, Y-pattern body with adjustment knob and threaded ends.

2.4 STRAINERS

A. Strainers: Y-pattern, unless otherwise indicated, and full size of connecting piping. Include ASTM A666, Type 304, stainless steel screens with 3/34-inch round perforations, unless otherwise indicated.

1. Pressure rating: 125 psig minimum steam working pressure, unless otherwise indicated.
2. NPS 2 and smaller: Bronze body, with female threaded ends.
3. NPS 2-1/2 and Larger: Cast-iron body, with interior AWWA C550 or FDA-approved, epoxy coating and flanged ends.

2.5 OUTLET BOXES

A. Manufacturers

1. Guy Gray Manufacturing Co., Inc.
2. Acorn Engineering Company
3. Zurn Industries, Inc.

B. General: Recessed-mounting outlet boxes with supply fittings complying with ASME A112.18.1M. Include box with faceplate, services indicated for equipment connections and wood-blocking reinforcement. Boxes shall be metallic

C. Washing Machine Outlet Boxes: Guy Gray stainless steel washing machine outlet box with quarter turn valves

D. Icemaker Outlet Boxes: Guy Gray stainless steel ice maker box

2.6 HOSE BIBBS & WALL HYDRANTS

a. Refer to Section 22 40 00 – Plumbing Fixtures

2.7 TRAP SEAL PRIMER VALVES

A. Trap Seal Primer System: Factory-fabricated, ASSE 1044:

1. Manufacturers (or equal):

    a. Precision Plumbing Products, Inc.
    b. Sloan
    c. Zurn

2. Trap Priming Manifold Type

   a. Piping: NPS 3/4, ASTM B 88, Type L (ASTM B 88M, Type B); copper, water tubing inlet and manifold with number of NPS 1/2 outlets as indicated.
   b. Cabinet: Steel box with stainless-steel cover.
   c. Water Hammer Arrester: ASSE 1010.
   d. Vacuum Breaker: ASSE 1001.

3. Fixture Flush Pipe-Fed Type

   a. One-piece, chrome-plated, vacuum breaker trap primer flush connection with integral water deflector
   b. Cast-brass
   c. NPS 3/8 minimum, elbow and flexible connector to wall
   d. Wall flanges and fittings to connect to NPS 1/2 pipe

2.8 DRAIN VALVES

A. Hose-End Drain Valves: MSS SP-110, NPS 3/4 ball valve, rated for 400-psig minimum CWP. Include two-piece, copper-alloy body with standard port, chrome-plated brass ball, replaceable seats and seals, blowout-proof stem, and vinyl-covered steel handle.

   1. Inlet: Threaded or solder joint.
   2. Outlet: Short-threaded nipple with ASME B1.20.7, garden-hose threads and cap.

B. Stop-and-Waste Drain Valves: MSS SP-110, ball valve, rated for 200-psig minimum CWP or MSS SP-80, Class 125, gate valve; ASTM B 62 bronze body, with NPS 1/8 side drain outlet and cap.

2.9 MISCELLANEOUS PIPING SPECIALTIES

A. Water Hammer Arresters: ASSE 1010 or PDI-WH 201, metal-bellows type with pressurized metal cushioning chamber. Sizes indicated are based on ASSE 1010 or PDI-WH 201, Sizes A through F.

   1. Manufacturers:

      a. Josam Co.
      b. Smith, Jay R. Mfg. Co.
      c. Zurn Industries, Inc.; Specification Drainage Operation.
      d. Or equal

B. Optional Water Hammer Arresters: ASSE 1010 or PDI-WH 201, piston type with pressurized metal-tube cushioning chamber. Sizes indicated are based on ASSE 1010, Sizes AA and A through F or PDI-WH 201, Sizes A through F.

   1. Manufacturers (or equal):

      a. Josam Co.
      b. Precision Plumbing Products, Inc.
      c. Watts Industries, Inc.; Drainage Products Div.
      d. Zurn Industries, Inc.; Wilkins Div.

C. Air Vents: Float type for automatic air venting.

1. Bolted Construction: Bronze body with replaceable, corrosion-resistant metal float and stainless-steel mechanism and seat; threaded NPS 1/2 minimum inlet; 125-psig minimum pressure rating at 140 deg F; and threaded vent outlet.
2. Welded Construction: Stainless-steel body with corrosion-resistant metal float, stainless-steel mechanism and seat, threaded NPS 3/8 minimum inlet, 150-psig minimum pressure rating, and threaded vent outlet.

D. Open Drains: Shop or field fabricate from ASTM A 74, Service class, hub-and-spigot, cast-iron, soil-pipe fittings. Include P-trap, hub-and-spigot riser section; and where required, increaser fitting, joined with ASTM C 564, rubber gaskets.

E. Deep-Seal Traps: Cast-iron or bronze casting, with inlet and outlet matching connected piping and cleanout trap seal primer valve connection.

1. NPS 2: 4-inch- minimum water seal.
2. NPS 2-1/2 and Larger: 5-inch- minimum water seal.

F. Deep Seal Traps (with Open Funnel): Same as “Deep Seal Trap” specified above except that a bronze funnel is required. (Smith Figure 3822 or equal).

G. Floor-Drain Inlet Fittings: Cast iron, with threaded inlet and threaded or spigot outlet, and trap seal primer valve connection.

H. Backwater valve: Smith 7150 flapper-type backwater valve with cast iron body and extendable access cover.

I. Fixed Air-Gap Fittings: Manufactured cast-iron or bronze drainage fitting with semiopen top with threads or device to secure drainage inlet piping in top and bottom spigot or threaded outlet larger than top inlet. Include design complying with ASME A112.1.2 that will provide fixed air gap between installed inlet and outlet piping.

J. Stack Flashing Fittings: Counterflashing-type, cast-iron fitting, with bottom recess for terminating roof membrane, and with threaded or hub top for extending vent pipe.

K. Vent Caps: Cast-iron body with threaded or hub inlet and vandal-proof design. Include vented hood and set-screws to secure to vent pipe.

L. Vent Terminals: Commercially manufactured, shop- or field-fabricated, frost-proof assembly constructed of galvanized steel, copper, or lead-coated copper. Size to provide 1-inch (25-mm) enclosed air space between outside of pipe and inside of flashing collar extension, with counterflashing.

M. Expansion Joints: ASME A112.21.2M, assembly with cast-iron body with bronze sleeve, packing gland, and packing; of size and end types corresponding to connected piping.

2.10 SLEEVE PENETRATION SYSTEMS

A. Manufacturers:

1. ProSet Systems, Inc.
2. Or equal.

B. Description: UL 1479, through-penetration firestop assembly consisting of sleeve and stack fitting with firestopping plug.

1. Sleeve: Molded PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.
2. Stack Fitting: ASTM A 48 (ASTM A 48M), gray-iron, hubless-pattern, wye-branch stack fitting with neoprene O-ring at base and gray-iron plug in thermal-release harness in branch. Include PVC protective cap for plug.

a. Special Coating: Include corrosion-resistant interior coating on fittings for plastic chemical waste and vent stacks.

2.11 FLASHING MATERIALS (COORDINATE WITH ROOFING SPECIFICATIONS)

2.12 CLEANOUTS

A. Service: Sanitary, soil and waste piping

B. Manufacturers;

1. Zurn
2. J.R. Smith
3. Josam
4. Cresline
5. Or equal

C. Cleanouts shall be the same size as pipe except that cleanouts larger than 4 inches are not required. Install cleanouts and/or test tees at the foot of all soil, waste and drain stacks; and on each building drain outside of building. Cleanouts shall be installed every 50 feet or less on all horizontal drain lines.

D. At ends of horizontal lines in unfinished areas: Wye fitting with cast brass plugs, threaded

E. At base of vertical lines in unfinished areas and hard piped downspouts. Wye fitting with cast brass plugs, threaded

F. Cleanouts shall be as follows:

1. Vertical Lines Concealed: Josam 58600-COT-20.
2. Vertical Lines Exposed: Josam 58910.
3. Horizontal Lines Exposed and/or Above Accessible Ceilings: Josam 58900-20.
4. Horizontal Lines Concealed Under Floors with Tile, Vinyl, Terrazzo and/or Concrete Finish: Josam 555000Z-2.
5. Horizontal Lines Concealed Under Floors with Carpet Finish: Josam 55000Z-2-14.
6. Cleanouts for PVC piping shall be equal to Cresline DW75A.

G. Cleanouts to Grade (exterior cleanout): Josam 58900, cast iron floor cleanout with round heavy duty cover. Locate cleanout set in concrete yard box with cast iron cover marked “sewer”, Brooks 3Cl, Christy or equal large enough for two-way clean out assemblies.

H. Cleanouts for PVC piping shall be equal to Cresline DW75A.

2.13 FLOOR DRAINS & AREA DRAINS

A. Manufacturers:

1. J.R. Smith
2. Zurn
3. Wade
4. Josam

B. See Plumbing Fixture Schedule in the Construction Documents.

C. Provide trap primers to all floor drains and floor sinks, unless otherwise indicated.

2.14 ROOF DRAINS & OVERFLOW DRAINS

A. Manufacturers:

1. J.R. Smith
2. Zurn
3. Wade
4. Josam

B. See Plumbing Fixture Schedule in the Construction Documents.

C. Provide all roof & overflow drains with suitable flashing, extending a minimum of 10 inches beyond outer dimensions of the roof drain in all directions. Coordinate with roofing and waterproofing specifications and drawing details.

2.15 DOMESTIC HOT WATER RECIRCULATION PUMPS

A. Manufacturers:

1. Bell & Gossett
2. Taco
3. Grundfos
4. Or equal

B. Description: Furnish and install domestic hot water recirculation pumps of the size and capacity shown in the Construction Documents.

C. Pump Construction:

1. Housing: Bronze
2. Impeller: Bronze, closed type
3. Shaft: Stainless Steel
4. Mechanical Seal: Stainless Steel

5. Motor: Open dripproof type with sleeve bearings and built-in automatic thermal overload protection, 1725 RPM

D. Provide and install strap-on aquastat to hot water recirculation line to control pump.

2.16 DOMESTIC WATER PACKAGED BOOSTER PUMPS

A. Manufacturers:

1. Variable-Speed Drive, Packaged Booster Pumps

a. Grundfos Hydro Multi-E Duplex
b. ITT Bell & Gossett
c. FlowTherm
d. Armstrong

B. Description: Factory-assembled and –tested, packaged booster pump units; complying with UL 778; suitable for potable-water service.

C. Minimum Pressure Rating: 175 psig.

D. Pump Arrangement: Duplex, with two equal-size pumps.

1 Pumps, in-line vertical multi-stage, ANSI Class 250 flange
2 Pump Construction:

a. Suction/discharge base, pump head, motor stool: cast iron
b. Impellers, diffuser chambers, outer sleeve: 304 stainless steel
c. Shaft: 316 stainless steel
d. Impeller wear rings: 304 stainless steel
e. Shaft journals and chamber bearings: Silicon Carbide
f. O-rings: EPDM

E. Integrated Variable Frequency Drive Motors

1 All motors shall be of the integrated variable frequency drive design consisting of a motor and a VFD with a built-in pump system controller. The complete VFD/motor assembly shall be manufactured and tested as one unit.
2 The integrated VFD/motor combination shall be UL recognized.

F. Motors: Comply with Section 23 05 13 – Motors and Controllers

G. Piping: ASME B31.9 for materials and installation

1 NPS 4 and Smaller: ASTM B88, Type L (ASTM B88M, Type B), drawn, copper, water tube with copper, solder-joint, pressure fittings and brazed joints.
2 NPS 5 and Larger: ASTM A53, Schedule 40, galvanized-steel pipe with threaded, cast-iron fittings and threaded joints.
3 Suction and discharge manifolds shall be constructed of 316 stainless steel.
4 Header End Connections NPS 2 and Smaller: Threaded.
5 Header Connections NPS 2-1/2 and Larger: Flanged.

H. The base frame shall be constructed of corrosion resistant 304 stainless steel. Rubber vibration isolation dampers shall be fitted between each pump and base frame for vibration isolation.

I. Pump isolation valves shall be provided on the suction and discharge of each pump

J. Shutoff Valves, NPS 2 and Smaller: MSS SP-110, 600-psig minimum CWP, bronze ball valve with ends matching piping.

K. Shutoff Valves, NPS 2-1/2 and Larger:: MSS SP-70, Class 125, bronze-trim, OS&Y, cast-iron gate valve with flanged ends or MSS SP-67, Type 1 for tight shutoff, 175 psig CWP, single flanged, cast-iron butterfly valve.

L. Check Valves: Spring-loaded non-slam type check valve on the discharge of each pump.

M. Dielectric Fittings: Assembly or fitting with insulating material isolating joined dissimilar metals, to prevent galvanic action and to stop corrosion.

1 NPS 2 and Smaller: Factory-fabricated union assembly, for 250 –psig minimum working pressure at 180 deg F.
2 NPS 2-1/2 and Larger: Factory-fabricated, companion-flange assembly; for 150- or 300-psig minimum working pressure as required to suit system pressures.

N. Sensors:

1 A pressure switch shall be installed on the suction manifold and shall be wired to the primary controller. When the inlet pressure falls below 3 psig for a period of five seconds, all pumps shall be switched off and a system alarm shall be indicated.
2 A pressure transducer shall be factory installed on the discharge manifold.

O. Control Panel: Automatic, with load control and protection functions. Comply with NEMA ICS 2 and UL 508.

1 Mounting and Wiring: Factory installed and connected as an integral part of unit.
2 Enclosure: NEMA ICS 6, Type 12.
3 Factory disconnect switch for each pump and motor. Disconnect switch shall have a NEMA 3R enclosure.
4 Motor Controller: Adjustable speed drive for each unit
5 Motor Overload Protection: Overload relay in each phase.
6 Duplex, Automatic Alternating Controls: Switches lead pump to lag main pump and to two-pump operation.
7 Triplex, Sequence (Lead-Lag-Lag) Controls: Switches lead pump to one lag main pump and to three-pump operation.
8 Instrumentation: Bourdon tube pressure gauge, 2.5 inch diameter, shall be placed on the suction and discharge manifolds.

P. Finish: Manufacturer’s standard paint applied to factory-assembled and –tested units before shipping.

Q. Manufacturer’s Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anti-corrossion compound after assembling and testing. Protect flanges, pipe openings and nozzles.

R. Testing

1 The entire pump package shall be factory performance tested as a complete unit prior to shipment. A verified performance test report shall be made available from the system manufacturer.
2 The system unit shall undergo a hydrostatic test of 250 psig for a minimum of 15 minutes prior to shipment.
3 Engage a factory-authorized representative startup packaged booster pump.

S. Warranty

1 The warranty period shall be a non-prorated period of 24 months from date of installation.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for piping joining materials, joint construction, and basic installation requirements.

B. Examine roughing-in of water distribution piping to verify actual locations of connections before plumbing specialty or pump installation.

C. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.

1. Locate backflow preventers in same room as connected equipment or system.
2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe to floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are not acceptable for this application.
3. Do not install bypass piping around backflow preventers.

D. Install pressure regulators with inlet and outlet shutoff valves and balance valve bypass. Install pressure gages on inlet and outlet.

E. Install strainers on supply side of each control valve, pressure regulator, and solenoid valve.

F. Install trap seal primer valves with outlet piping pitched down toward drain trap a minimum of 1 percent and connect to floor-drain body, trap, or inlet fitting. Adjust valve for proper flow.

G. Install backwater valves in building drain piping where required. For interior installation, provide cleanout deck plate flush with floor and centered over backwater valve cover, and of adequate size to remove valve cover for servicing.

H. Install expansion joints on vertical risers, stacks, and conductors if indicated.

I. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:

1. Size same as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless

larger cleanout is indicated.
2. Locate at each change in direction of piping greater than 45 degrees.
3. Locate at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
4. Locate at base of each vertical soil and waste stack.

J. Install strainers on supply side of each control valve, pressure regulator, and solenoid valve.

K. Install cleanout deck plates with top flush with finished floor, for floor cleanouts for piping below floors.

L. Install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall, for cleanouts located in concealed piping.

M. Install flashing flange and clamping device with each stack and cleanout passing through floors with waterproof membrane.

N. Install vent flashing sleeves on stacks passing through roof. Secure over stack flashing according to manufacturer's written instructions.

O. Install floor drains at locations shown on architectural drawings. Set grates of drains flush with finished floor, unless otherwise indicated.

1. Position floor drains for easy access and maintenance.
2. Set floor drains below elevation of surrounding finished floor to allow floor drainage. Set with grates depressed according to the following drainage area radii:

    a. Radius, 30 Inches or Less: Equivalent to 1 percent slope, but not less than 1/4-inch total depression.
    b. Radius, 30 to 60 Inches: Equivalent to 1 percent slope.
    c. Radius, 60 Inches or Larger: Equivalent to 1 percent slope, but not greater than 1-inch total depression.

3. Install floor-drain flashing collar or flange so no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes where penetrated.
4. Install individual traps for floor drains connected to sanitary building drain, unless otherwise indicated.

P. Install roof drains at locations shown on architectural drawings according to roof membrane manufacturer's written installation instructions.

1. Install roof-drain flashing collar or flange so no leakage occurs between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
2. Position roof drains for easy access and maintenance.

Q. Fasten wall-hanging plumbing specialties securely to supports attached to building substrate if supports are specified and to building wall construction if no support is indicated.

R. Fasten recessed-type plumbing specialties to reinforcement built into walls.

S. Install individual shutoff valve in each water supply to plumbing specialties. Use ball, gate, or globe valve if specific valve is not indicated. Install shutoff valves in accessible locations. Refer to Section 23 05 23 - Valves for general-duty ball, butterfly, check, gate, and globe valves.

T. Install air vents at piping high points. Include ball, gate, or globe valve in inlet [and drain piping from outlet to floor drain].

U. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.

V. Install escutcheons at wall, floor, and ceiling penetrations in exposed finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding pipe fittings.

3.2 PACKAGED BOOSTER PUMP INSTALLATION

A. Install concrete bases for packaged booster pumps. Refer to Division 03 for cast-in-place concrete, Section 23 00 10 – Mechanical General Provisions and 23 05 00 – Basic Mechanical Materials and Methods.

B. Install packaged booster pumps according to manufacturer's written instructions and with access for periodic maintenance, including removing motors, impellers, couplings and accessories.

C. Support packaged booster pumps using the following vibration-control devices, unless otherwise indicated. Refer to Section 23 05 48 – Mechanical Sound and Vibration Control.

1. Install units with total of 7.5 hp or less, with rubber-isolator mount or spring-isolator vibration isolators.
2. Install units with total of more than 7.5 hp, with concrete filled, inertia-base vibration isolation bases and spring-isolator vibration isolators.

D. Support connected piping so weight of water distribution piping is not supported by packaged booster pumps.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Connect plumbing specialties to piping specified in other Division 22 Sections.

D. Ground equipment.

E. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

F. Connect plumbing specialties and devices that require power according to Division 26 Sections.

3.4 PACKAGED BOOSTER PUMP CONNECTIONS

A. Piping installation requirements are specified in Section 22 11 16 – Domestic Water Piping. Drawings indicate general arrangement of piping and specialties. The following are specific connection requirements:

1. Connect water distribution piping to pumps. Install suction and discharge pipe equal to or greater than size of unit suction and discharge headers.
2. Install flexible pipe connectors on piping connections to unit suction and discharge headers. Install flexible pipe connectors same size as piping. Refer to Section 23 05 00 – Basic Mechanical Materials and Methods.
3. Install shutoff valves on piping connections to unit suction and discharge headers. Install valves same size as unit suction and discharge headers. Refer to Section 23 05 23 – Valves.

B. Install electrical connections for power, controls and devices
C. Electrical wiring and connections are specified under Division 26.
D. Ground equipment

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.5 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each backflow preventer, thermostatic water mixing valve, water tempering valve, trap seal primer system.

1. Text: Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit.
2. Refer to Section 23 00 10 – Mechanical General Provisions and Section 23 05 53 - Mechanical Systems Identification for nameplates and signs.

3.6 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled trap seal primer systems and their installation, including piping and electrical connections. Report results in writing.

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new units, and retest.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.7 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

3.8 PACKAGED BOOSTER PUMP COMMISSIONING

A. Before operating pumps, perform the following checks:

1. Check piping connections for tightness.
2. Controls: Set for automatic starting, stopping, sequential, and alarm operations.
3. Final Checks before Starting: Perform the following preventative maintenance operations:

    a. Lubricate bearings.
    b. Verify that each pump is free to rotate by hand and that pump for handling hot liquids is free to rotate with pump hot and cold. Do not operate pump if it is bound or drags, until cause of problem is determined and corrected.
    c. Verify that pump controls are correct for required application.

B. Starting procedure for pumps is as follows:

1. Prime pumps by opening suction valves and closing drains and prepare pump for operation.
2. Open valves if pumps should not be operated against dead shutoff.
3. Start motors.
4. Open discharge valves slowly.
5. Check general mechanical operation of pumps and motors.
6. Close valves once there is sufficient flow though pumps to prevent overheating.

3.9 DEMONSTRATION

A. Engage a factory-authorized service representative to train Using Agency’s maintenance personnel to adjust, operate, and maintain backflow preventers, pumps, and mixing valves. Refer to Secton 23 00 10 – Mechanical General Provisions.

END OF SECTION 22 16 00

SECTION 22 34 00 - FUEL-FIRED, COMMERCIAL WATER HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section. These Plumbing provisions specified herein apply to all Sections of Division 22.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 22.

1.2 SUMMARY

A. This Section includes the following for domestic water systems:

1. Tankless, gas water heaters.
2. Compression tanks.
3. Accessories.

1.3 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Water heater	R	R		R
Water heater accessories	R	R		R
Boiler controls	R	R		

C. Water heater

1. Certified dimensioned shop drawings
2. Materials of construction, thickness of tubes, shell, boilerplate and insulation
3. Firing and combustion air control systems
4. Electrical requirements
5. Safety devices
6. Minimum and maximum gas pressure at burner
7. Controls
8. Wiring diagrams
9. Field mounted equipment and devices

D. Manufacturer's instructions for:

1. Installation
2. Operation
3. Maintenance and repair

E. Within warranty indicating full compliance with Paragraph 1.6

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain same type of water heaters through one source from a single manufacturer.
B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.
C. ANSI Compliance: Provide gas water heaters that comply with ANSI standards for gas water heaters and related products and that bear AGA certification label.
D. ASHRAE Standards: Comply with performance efficiencies prescribed for the following:

1. ASHRAE 90.1-2010, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings," for commercial water heaters.

E. ASME Compliance:

1. Where ASME-code construction is indicated, fabricate and label commercial water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. Where ASME-code construction is indicated, fabricate and label commercial, finned-tube water heaters to comply with ASME Boiler and Pressure Vessel Code: Section IV.

F. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9" for all components that will be in contact with potable water.

1.5 COORDINATION

A. Coordinate size and location of concrete bases with Architectural and Structural Drawings.

1.6 WARRANTY

A. General Warranty: Special warranty specified in this Article shall not deprive the Using Agency of other rights the Using Agency may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.
B. Special Warranty: Written warranty, executed by manufacturer agreeing to repair or replace components of water heaters that fail in materials or workmanship within specified warranty period.

1. Failures include rusty water or heating surfaces due to lime scale build-up.
2. Warranty Period: From date of acceptance by the Using Agency.

a. Burner Assemblies: 1 Year complete parts, labor and freight; additional four (4) years parts.
b. Heat Exchanger: Five (5) years warranty.

3. Heater shall have a five (5) year non-prorated limited warranty against leaks or production of rusty water, including a three (3) year non-prorated limited warranty covering failure of heating surfaces due to lime scale build-up. Warranty shall include a one year cost free service policy including labor and freight for service due to factory defect. The manufacturer's written warranty shall be part of the submittals.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 TANKLESS, GAS WATER HEATERS

A. Description: AGA certified; tankless, temperature controlled, continuous flow, water heaters for natural-gas fuel.

1. Manufacturers:

a. Rinnai Corporation
b. Takagi
c. Or equal

B. Construction: Without hot-water storage.

1. Working-Pressure Rating: 150 psig.
2. Tappings: ASME B1.20.1, pipe thread.
3. Interior Finish: Materials complying with NSF 61, barrier materials for potable-water tank linings.
4. Jacket: Aluminum or steel, with enameled finish, or plastic.

C. Burner: Direct vent, forced combustion for natural-gas fuel.

1. Temperature Control: Adjustable remote thermostat.
2. Safety Control: Flame failure, boiling protection, remaining flame (OHS),thermal fuse, automatic frost protection, combustion fan rpm check, overcurrent and automatic unit temperature control default to 100 deg F. (anti-scald).
3. Automatic Ignition: ANSI Z21.20, automatic battery-sparked gas-ignition system and components.

D. Capacities are scheduled on the drawings.

2.3 COMPRESSION TANKS

A. Description: Steel, pressure-rated tank, ASME-constructed with welded joints and factory-installed, butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.

1. Manufacturers:

a. Amtrol, Inc.
b. Smith: A.O. Smith; Aqua-Air Div.
c. Wessels
d. Elbi

B. Construction: 150-psig (1035-kPa) working-pressure rating.

C. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1, pipe thread.

D. Tank Interior Finish: Materials and thicknesses complying with NSF 61, barrier materials for potable-water tank linings. Extend finish into and through tank fittings and outlets.

E. Air-Charging Valve: Factory installed.

2.4 STORAGE TANKS

A. Fabricated and stamped in accordance with the ASME BPV Code Section VII, Division 1 with a stamped MAWP of 125 psig and a maximum design temperature of 500 °F and suitable for Potable Water Systems.

1. Manufacturers:

a. John Wood
b. Taco
c. Wessels

B. Tappings: Factory fabricated of materials compatible with tank. Attach tappings to tank before testing.

1. NPS 2 and Smaller: Threaded ends according to ASME B1.20.1.
2. NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges, and according to ASME B16.24 for copper and copper-alloy flanges.

C. Vertical insulated storage tank.

D. Materials of Construction: Carbon Steel

E. Outside Finish: Urethane Paint

F. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.

G. Lining: Glass complying with NSF 61 barrier materials for potable-water tank linings, including extending lining into and through tank fittings and outlets.

H. Furnished with magnesium anode rods.

I. Dip Tube: Provide unless cold-water inlet is near bottom of tank.

J. Drain Valve: Corrosion-resistant metal complying with ASSE 1005.

K. Insulation: Comply with ASHRAE/IESNA 90.1-2010. Surround entire storage tank except connections.

L. See drawings for tank capacities.

2.5 WATER HEATER ACCESSORIES

A. Gas Shutoff Valves: ANSI Z21.15, manually operated. Furnish for installation in piping.
B. Gas Pressure Regulators: ANSI Z21.18, appliance type, factory or field installed. Include pressure rating, capacity, and pressure differential required for water heater and gas supply.

C. Vent System: Provide complete concentric combination combustion air intake and exhaust vent piping system including, but not limited to the following: vertical discharge adaptor, vertical concentric piping, vent pipe clamps, condensate collector, roof flashing assembly, roof disharge terminal and fittings.

D. Water Heater Mounting Brackets: Water heater manufacturer's factory-fabricated steel bracket for wall mounting and capable of supporting water heater and water.

E. Piping Manifold Kits: Water heater manufacturer's factory-fabricated inlet and outlet piping arrangement for multiple-unit installation. Include piping and valves for field assembly that is capable of isolating each water heater and of providing balanced flow through each water heater.

F. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1-2010.

G. Controls: Provide complete operating system with multiple unit controllers, controllers to select and change hot water supply temperature and non-polarized two-core cable. Controller shall have capability to rotate lead water heater to equalize multiple water heater operation time.

H. Aquastat: Provide aquastat as required to control water heater operation and recirculation pump. Provide aquastat per manufacturer’s recommendations.

PART 3 - EXECUTION

3.1 WATER HEATER INSTALLATION

A. Install water heater, level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.

B. Anchor water heaters to substrate.

C. Install and connect gas water heaters according to NFPA 54.

1. Install appliance, gas pressure regulators on gas-burner inlets of water heaters without pressure regulators.
2. Install vent piping from gas-train pressure regulators and valves to outside of building where required. Terminate vent piping with brass-screened vent cap fitting. Do not combine vents except with approval of authorities having jurisdiction.

D. Install combination temperature and pressure relief valves in water piping for water heaters without storage. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

E. Install water heater drain piping as indirect waste to spill into open drains or over floor drains. Install hose-end drain valves at low points in water piping for water heaters that do not have tank drains. Refer to Division 22 Section "Plumbing Specialties" for drain valves.

F. Install thermometers on water heater and storage tank inlet and outlet piping. Refer to Division 22 Section "Meters and Gages for Plumbing Piping" for thermometers.

G. Assemble and install inlet and outlet piping manifold kits for multiple water heaters. Fabricate, modify, or arrange manifolds for balanced water flow through each water heater. Include shutoff valve and thermometer in each water heater inlet and outlet, and throttling valve in each water heater outlet. Refer to Division 22 Section "General-Duty Valves for Plumbing Piping" for general-duty valves and to Division 22 Section "Meters and Gages for Plumbing Piping" for thermometers.

H. Arrange for insulation on equipment and piping not furnished with factory-applied insulation. Fill water heaters with water.

I. Charge compression tanks with air.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Connect hot- and cold-water piping with shutoff valves and unions.

D. Connect gas piping to gas burner with drip leg, tee, shutoff valve, and union; minimum size same as inlet connection.

E. Make connections with dielectric fittings where piping is made of dissimilar metal.

F. Gas, Water Heater Vent Connections: Connect to vent system. Include draft hoods and diverters where required. Use vents same size as or larger than water heater outlets, but not smaller than indicated unless smaller vent size has been calculated according to NFPA 54. Comply with gas utility requirements for sizing.

G. Electrical Connections: Power wiring and disconnect switches are specified in Division 26 Sections. Arrange wiring to allow unit service.

H. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Engage a factory-authorized service representative to perform startup service.

B. In addition to manufacturer’s written installation and startup checks, perform the following:

1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment and retest until satisfactory results are achieved.
2. Verify that piping system tests are complete.
3. Check for piping connection leaks.
4. Check for clear relief valve inlets, outlets, and drain piping.
5. Test operation of safety controls, relief valves, and devices.
6. Energize electric circuits.
7. Adjust operating controls.
8. Adjust hot-water-outlet temperature settings. Do not set above 135 deg F unless piping system application requires higher temperature.

3.4 FIELD QUALITY CONTROL

A. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain water heaters.

1. Train Using Agency’s maintenance personnel on procedures for starting and stopping troubleshooting, servicing, and maintaining equipment. Refer to Division 22 Section “Plumbing General Provisions”.
2. Review date in maintenance manuals. Refer to Division 22 Section “Plumbing General Provisions”.
3. Schedule training with Using Agency, through Professional, with at least seven days’ advance notice.

END OF SECTION 22 34 00

SECTION 22 40 00 – PLUMBING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These Plumbing provisions specified herein apply to all Sections of Division 22.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 22.

1.2 WORK INCLUDED

A. This Section includes plumbing fixtures and related components.

1.3 RELATED WORK AND REQUIREMENTS

A. Requirements of General Conditions, Division 1

B. Section 01 91 00 - Commissioning

C. Section 22 16 00 - Plumbing Specialties

D. Section 23 00 10 – Mechanical General Provisions

E. Section 23 08 00 - Mechanical Commissioning

1.4 DEFINITIONS

A. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Fitting: Device that controls flow of water into or out of plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

1.5 SUBMITTALS

A. See Section 01 33 23 - Shop Drawings, Product Data and Samples

B. See Section 23 00 10 – Mechanical General Provisions

C. Product Data: Include selected fixture and trim, fittings, accessories, appliances, appurtenances, equipment, and supports and indicate materials and finishes, dimensions, construction details, and flow-control rates for each type of fixture indicated. All product data for plumbing fixtures shall be submitted to the Using Agency for review and approval.

D. Shop Drawings: Diagram power, signal, and control wiring and differentiate between manufacturer-

installed and field-installed wiring.

E. Maintenance Data: For plumbing fixtures to include in maintenance manuals specified in Division 1.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.

1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, obtain similar products from other manufacturers specified for that category.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act".

D. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

E. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

F. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

G. Comply with the following applicable standards and other requirements specified for plumbing fixtures:

1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
2. Hand Sinks: NSF 2 construction.
3. Porcelain-Enameled, Formed-Steel Fixtures: ASME A112.19.4M.
4. Stainless-Steel Fixtures Other Than Service Sinks: ASME A112.19.3M.
5. Vitreous-China Fixtures: ASME A112.19.2M.
6. Water-Closet, Flush Valve, Tank Trim: ASME A112.19.5.
7. Water-Closet, Flushometer Tank Trim: ASSE 1037.

H. Comply with the following applicable standards and other requirements specified for sink faucets:

1. Backflow Protection Devices for Faucets with Side Spray: ASME A112.18.3M.
2. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3M.
3. Diverter Valves for Faucets with Hose Spray: ASSE 1025.
4. Faucet Hose: ASTM D 3901.
5. Faucets: ASME A112.18.1M.
6. Hose-Connection Vacuum Breakers: ASSE 1011.
7. Hose-Coupling Threads: ASME B1.20.7.
8. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
9. NSF Materials: NSF 61.
10. Pipe Threads: ASME B1.20.1.
11. Sensor-Actuated Faucets and Electrical Devices: UL 1951.

12. Supply and Drain Fittings: ASME A112.18.1M.

I. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:

1. Atmospheric Vacuum Breakers: ASSE 1001.
2. Brass and Copper Supplies: ASME A112.18.1M.
3. Manual-Operation Flushometers: ASSE 1037.
4. Plastic Tubular Fittings and Piping: ASTM F 409.
5. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.
6. Tubular Brass Drainage Fittings and Piping: ASME A112.18.1M.

J. Comply with the following applicable standards and other requirements specified for miscellaneous components:

1. Disposers: ASSE 1008 and UL 430.
2. Floor Drains: ASME A112.21.1M.
3. Grab Bars: ASTM F 446.
4. Hose-Coupling Threads: ASME B1.20.7.
5. Hot-Water Dispensers: ASSE 1023 and UL 499.
6. Off-Floor Fixture Supports: ASME A112.6.1M.
7. Pipe Threads: ASME B1.20.1.
8. Plastic Toilet Seats: ANSI Z124.5.
9. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.7 COORDINATION

A. Coordinate roughing-in and final plumbing fixture locations, and verify that fixtures can be installed to comply with original design and referenced standards.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General:

1. Provide fixtures and trim complete for proper installation as described in the manufacturer's catalog with the modifications as shown on Plumbing Fixture Schedule in the plans or specifications.
2. All fixtures, specified to be of vitreous ware, shall be of a quality known commercially as "twice fired" vitreous chinaware of the best quality, nonabsorbent, burned so that the whole mass is thoroughly fused and vitrified producing a material white in color, which when fractured will show a homogeneous mass, close-grained and free from pores. The glazed and vitreous china fixtures shall be white, thoroughly fused and united to the body, without discoloration, chips, or flaws and shall be free from cracks. Warped or otherwise imperfect fixtures will not be acceptable.
3. Factory grind back and bases of fixtures smooth.
4. Enamelware to be white cast iron with acid-resisting enamel.
5. Unless otherwise specified, water closets to have a waste passage to pass a 2-1/2 inch ball minimum. Bolt water closets to flanges with a 1-inch thick rubber foam gasket.
6. Fixture trim and exposed metal items shall be polished chrome-plated unless otherwise noted, and pipes passing through walls shall have polished chrome-plated escutcheon

plates. All stainless steel shall be satin brushed (US32D) finish unless noted otherwise.

7. Fixtures shall be free from imperfections, true as to line, angles, curves, and color; smooth, watertight and practically noiseless in operation.
8. Exposed Pipe, Trim Including Fittings, Traps, Escutcheons, Valves, Valve Handles, and Accessories: Above and Below Fixtures:

    a. Polished chrome plated CP brass.
    b. Set-screw cast brass escutcheons for piping.
    c. Traps: Cast brass with cleanout plugs.
    d. Covering tubes not permitted.
    e. Provide Hudee stainless steel rims, as applicable, for non-selfrimming counter mounted fixtures.

9. Supply Fixtures With:

    a. Renewable seats or replaceable internal units.
    b. Compositional washers.

2.2 MANUFACTURERS

A. Manufacturers for fixtures and trim:

1. Fixtures (vitreous china): Toto, Zurn, Kohler, American-Standard
2. Sinks (stainless steel): Just, Elkay, Kohler, American Standard
3. Floor and roof drains, carriers, etc.: Zurn, J.R. Smith, Josam
4. Sink and lavatory trim: Zurn, Kohler, Delta
5. Electric water coolers: Haws, Elkay, or Equal
6. Safety eyewash and shower: Haws, Encon Safety Products or equal
7. Flush Valves: Water closets and urinals shall be manual **[battery sensor operated] [hard-wired sensor operated]** flush type. Sensor operated water closet flush valves shall have manual over-ride button.

2.3 FLUSH VALVE PLUMBING FIXTURES

A. Provide vacuum breakers and angle control-stop valves for each flush valve. Vacuum breakers shall conform to ASSE 1001. Exposed to view and pressure containing components of flush valves, vacuum breaker, angle control-stop valve, tail pieces, slip nuts, escutcheon plates, and wall plates shall be chromium-plated copper alloy or polished stainless steel. Water flushing volume of the flush valve shall not exceed the gallons per flush required below, and is factory set as required by the fixture. Mount flush valves not less than 11 inches above neither the fixture nor more than 44 inches above the floor for ADA accessible fixtures. For ADA accessible water closets, controls for flush valves shall be located on the wide side of the toilet area.

B. Water Closets (WC): See plumbing fixture schedule on Drawings

C. Urinals (U): See plumbing fixture schedule on Drawings

2.4 LAVATORIES AND SINKS

A. Lavatories (L): See plumbing fixture schedule on Drawings

B. Mop Basin (MB): See plumbing fixture schedule on Drawings

2.5 ELECTRIC WATER COOLERS

A. Electric Drinking Fountain (EDF): See plumbing fixture schedule on Drawings

2.6 SHOWERS

A. SHOWERS (SH): See plumbing fixture schedule on Drawings

2.7 TUB/SHOWER

A. TUB SHOWER (TB): See plumbing fixture schedule on Drawings

2.8 PLUMBING FIXTURE FAUCETS, TRIM AND FITTINGS

A. ASME A112.18.1M for plumbing fixture faucets. The finish of plumbing fixture faucets, trim, valves, and fittings exposed to view shall be chromium-plate or polished stainless steel except as modified herein. Bolts, nuts, and screws shall be copper alloy or stainless steel. Provide ball valves or 4 turn angle valve connections in each supply to each faucet; chromium-plated finish is not required if not exposed to view. Supply risers shall be chrome plated copper flex riser style smooth surface. Faucets shall be the washerless type and shall have threaded type end connections, coupling nuts, or union connections. Provide washers and lock nuts to secure faucets to lavatories and sinks.

B. Traps: Provide P-traps for each plumbing fixture that do not have integral traps. Provide 1.5 inch brass adjustable P-traps, 16 gauge tubing with slip nuts and gaskets; chromium-plated finish is required if exposed.

C. Continuous Waste: Tubular brass, 0.045-inch wall thickness, with slip-joint inlet and size to match equipment.

D. Indirect Waste: Tubular brass, 0.045-inch wall thickness, with slip-joint inlet and size to match equipment.

E. FHB-1 Freezeproof Hose Bibb: Nonfreeze concealed-outlet wall hydrants, ASSE 1019, self-drainable with flush-mounting box with cover, integral nonremovable hose-connection vacuum breaker, cast bronze casing and operating rod to match wall thickness, concealed outlet, and wall clamp. ASME A112.21.3M, key-operation hydrant with pressure rating of 125 psig. Inlet NPS 3/4 threaded or solder joint. Outlet ASME B1.20.7, garden hose threads. Operating keys, one with each key-operation hydrant.

1. Classification: Type A, for automatic draining with hose removed or Type B, for automatic draining with hose removed or with hose attached and nozzle closed.
2. Box and Cover Finish: polished nickel bronze.
3. Manufacturer: Woodford B65, Josam, Watts, Zurn

F. Hose Bibbs: Bronze body with replaceable seat disc complying with ASME A112.18.1M for compression-type faucets. Include NPS 1/2 or NPS 3/4 threaded or solder-joint inlet, of design

suitable for pressure of at least 125 psig; integral [or field-installed,] nonremovable, drainable hose-connection vacuum breaker; and garden-hose threads complying with ASME B1.20.7 on outlet.

1. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
2. Finish for Service Areas: Chrome or nickel plated.
3. Finish for Finished Rooms: Chrome or nickel plated.
4. Operation for Equipment Rooms: Operating key.
5. Operation for Service Areas: Operating key.
6. Operation for Finished Rooms: Operating key.
7. Include operating key with each operating-key hose bibb.
8. Include wall flange with each chrome- or nickel-plated hose bibb.

2.9 PROTECTIVE SHIELDING GUARDS

A. Protective Shielding Guard: Manufactured, plastic covering or enclosure for hot- and cold-water supplies and trap and drain piping and complying with ADA requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water soil and for waste piping systems and supports to verify actual locations and sizes of piping connections and that locations and types of supports match those indicated, before plumbing fixture installation. Use manufacturer's roughing-in data if roughing-in data are not indicated.

B. Examine walls, floors, and cabinets for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Include supports for plumbing fixtures according to the following:

1. Heavy-Duty Chair Carriers: For accessible lavatories and other fixtures where indicated.

B. Include fitting insulation kits for accessible fixtures according to the following:

1. Lavatories: Cover Hot-and cold-water supplies, stops and handles, drain, trap, and waste to wall.
2. Fixtures with Offset Drain: Cover hot-and cold-water supplies, offset drain, trap, and waste to wall.
3. Other Fixtures: Cover exposed fittings below fixture.

3.3 FIXTURE INSTALLATION

A. Assemble fixtures, trim, fittings, and other components according to manufacturers' written instructions.

B. For wall-hanging fixtures, install off-floor supports affixed to building substrate.

1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.

C. Install back-outlet, wall-hanging fixtures onto waste fitting seals and attach to supports.

D. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate. Closet flanges shall be anchored to the floor per manufacturer's recommendations.

E. Install wall-hanging fixtures with tubular waste piping attached to supports.

F. Install counter-mounting fixtures in and attached to casework.

G. Install fixtures level and plumb according to manufacturers' written instructions and roughing-in drawings.

H. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.

1. Exception: Use ball, gate, or globe valve if stops are not specified with fixture.
2. Refer to Section 23 05 23 - Valves for general-duty valves.

I. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

J. Install flushometer valves for accessible water closets and urinals with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.

K. Install toilet seats on water closets.

L. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

M. Install water-supply, flow-control fittings with specified flow rates in fixture supplies at stop valves.

N. Install faucet, flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

O. Install traps on fixture outlets.

1. Exception: Omit trap on fixtures with integral traps.
2. Exception: Omit trap on indirect wastes, unless otherwise indicated.

P. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for escutcheons.

Q. Seal joints between fixtures and walls, floors, and counters using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Refer to Division 7 Section "Joint Sealants" for sealant and installation requirements.

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect water supplies from water distribution piping to fixtures.

C. Connect drain piping from fixtures to drainage piping.

D. Supply and Waste Connections to Plumbing Fixtures: Connect fixtures with water supplies, stops, risers, traps, and waste piping. Use size fittings required to match fixtures. Connect to plumbing piping.

E. Supply and Waste Connections to Fixtures and Equipment Specified in Other Sections: Connect fixtures and equipment with water supplies, stops, risers, traps, and waste piping specified. Use size fittings required to match fixtures and equipment. Connect to plumbing piping.

F. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

G. Arrange for electric-power connections to fixtures and devices that require power. Electric power is specified under Division 26.

3.5 FIELD QUALITY CONTROL

A. Verify that installed fixtures are categories and types specified for locations where installed.

B. Check that fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

E. Install fresh batteries in sensor-operated mechanisms.

3.6 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Adjust water pressure at faucets, and flushometer valves to produce proper flow and stream.

C. Replace washers and seals of leaking and dripping faucets and stops.

3.7 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:

1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
2. Remove sediment and debris from drains.

3.8 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of fixtures for temporary facilities unless approved in writing by Using Agency.

END OF SECTION 22 40 00

SECTION 23 00 10 – MECHANICAL GENERAL PROVISIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 DIVISION OF WORK

A. This section delineates the division of work between Divisions.

B. Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable installation. This section is provided to assist the Contractor in coordination of work scope but shall not be construed to limit Contractor's scope of work encompassed by the contract documents.

C. Coordination with other Trades: The following table is intended to assist the Contractors in coordinating the scope of work between Division 23 (Indicated as 23 in table), Section 23 09 00 Energy Management & Control System (indicated as 23C), and other Divisions as indicated. However, the General Contractor is ultimately responsible for coordination among his subcontractors regardless of what is listed in this Section.

INTERFACE/RESPONSIBILITY MATRIX

12.	Framing of walls and ceilings to accept air outlets, fire dampers, etc.	9	9	-	-	[29]

INTERFACE/RESPONSIBILITY MATRIX						
System		Division under which the following is specified				Remarks
		Equipment	Installation	Power Wiring [1]	Control & Interlock Wiring [1]	
13.	Ceiling and wall access doors	23	8	-	-	[30]

NUMBERED REMARKS::

[1] Wiring includes raceway, fittings, wire, boxes and related items, all voltages

[2] Wiring of interlock of duct smoke detectors to shut off supply fans upon detection of smoke is specified under Section 23 09 00 Energy Management & Control System. All other smoke control/fire alarm related control wiring is specified under Division 26 Electrical.

[3] End switch required only for monitoring position of damper. See HVAC drawings and Division 23 smoke and fire damper specifications to see where required.

[4] Factory installed starters and variable speed drives are specified under Division 23 HVAC. Prewired control panel is specified under Division 23 HVAC, single point power connection (unless otherwise noted on drawings) specified by Division 23 HVAC. Packaged mechanical equipment specified with BACnet communication cards/gateways shall be provided by Division 23 HVAC. Packaged mechanical equipment vendor to provide all necessary technical assistance to Division 23C Contractor in mapping across equipment points to the EMCS.

[5] Applies to motors that are not covered by note 3. Integral starter control devices such as HOA switches, 120V control transformers and time delay relays (from high to low speed) for two speed motors specified under Division 26 Electrical.

[6] Single phase 120V motors with integral motor overload protection specified under Division 23 HVAC. Line voltage control device such as thermostat or switch specified under 23 09 00 Energy Management & Control Systems; wiring and conduit between control device and motor specified under Division 26 Electrical.

[7] Chilled and condenser water flow switches (where required by chiller manufacturer) specified under Division 23 HVAC; wiring and conduit specified under Section 23 09 00 Energy Management & Control System; bi-directional (read/write) BACnet communication card/gateway between the EMCS and chiller control panels specified with chiller under Division 23 HVAC; chiller vendor to provide all necessary technical assistance to Division 23C Contractor in mapping across chiller points to the EMCS

[8] BACnet communication card/gateway between the EMCS and boiler control panel specified with boiler under Division 23 HVAC; boiler vendor to provide all necessary technical assistance to Division 23C Contractor in mapping across boiler points to the EMCS

[9] Disconnects are specified under Division 23 HVAC where specifically called for in equipment schedules or specifications to be factory installed with equipment. Otherwise all disconnects are specified under Division 26 Electrical.

[10] Emergency override switches, status lights, and other refrigerant machinery room controls as required by ASHRAE Standard 15 and IMC is specified under Division 23 HVAC.

[11] Power to all EMCS control panels is specified under Section 23 09 00 Energy Management & Control Systems, coordinate with Division 26 contractor for available circuits.

[12] Line-voltage controlled circuit connections to and from lighting panel relays and 120V power are specified under Division 26 Electrical. Programming and time scheduling specified under Section 23 09 00 Energy Management & Control Systems.

[13] Interface device required in light control relay panels to accept low-voltage switch inputs are

INTERFACE/RESPONSIBILITY MATRIX					
System	Division under which the following is specified				Remarks
	Equipment	Installation	Power Wiring [1]	Control & Interlock Wiring [1]	
specified under Section 23 09 00 Energy Management & Control Systems. [14] Power measuring sensors, installation and wiring to a central controller with Modbus interface specified under Division 26 Electrical. Modbus gateway and network connection from gateway to EMCS specified under Section 23 09 00 Energy Management & Control Systems. Power monitoring control vendor to provide all necessary technical assistance to Section 23 09 00 Energy Management & Control Systems Contractor in mapping across power monitoring control points to the EMCS. [15] Generator monitoring sensors and central controller with Modbus gateway specified under Division 26 Electrical. Gateway and network connection from gateway to EMCS specified under Section 23 09 00 Energy Management & Control Systems. Generator vendor to provide all necessary technical assistance to Section 23 09 00 Energy Management & Control Systems Contractor in mapping across monitoring control points to the EMCS. Modbus connection point will be located in room XXXXX. [16] Generator with skid tank or day tank, including transfer pump and controls, is specified under Division 26 Electrical. Connecting alarms to the EMCS, including conduit and wire for controls, is specified under Section 23 09 00 Energy Management & Control Systems. Fuel supply system and all power connections for fuel pumps and panel controls are specified under Division 26 Electrical. [17] Coordinate piping from condensate pans to the sewer system including trap and final connections is specified under Division 22 Plumbing. Piping from auxiliary drain pans where provided at air handling equipment in furred spaces is specified under Division 23 HVAC. [18] Domestic make-up water, including shut-off valve, backflow prevention, rough-in and final connection to hot water, chilled water, condenser water and any other HVAC systems requiring make-up water is specified under Division 22 Plumbing. Pressure reducing valves with bypass valve and shut-off valves at each closed-system make-up water connection are specified under Division 23 HVAC. [19] Pressure reducing valves to deliver gas at the pressure required by mechanical equipment, including final connections and shut-off cock, is specified under Division 22 Plumbing. All other gas control and regulating devices provided under the Section providing the gas-fired equipment. Venting of gas regulating devices and other equipment gas-train devices where required is specified under Division 22 Plumbing. [20] Test plugs mounted adjacent to all temperature well (for calibration) specified under Division 23 [21] Hoods, including all fire protection devices (e.g. dampers at outlets), are specified under Division 23 HVAC. Duct connection to hood from collar on the exhaust fan specified under Division 23 HVAC. Decorative duct enclosures to hide exhaust duct from view where required is specified under Division 23 HVAC. All related control wiring, switches, etc. specified under Section 23 09 00 Energy Management & Control Systems. [22] Duct access doors required for access to control devices where required specified under Division 23 HVAC. [23] Actuators for motorized dampers supplied with fans or hood where scheduled on HVAC drawings are specified under Division 23 HVAC, mounted and wired.					

INTERFACE/RESPONSIBILITY MATRIX					
System	Division under which the following is specified				Remarks
	Equipment	Installation	Power Wiring [1]	Control & Interlock Wiring [1]	
[24] Laboratory controls including all temperature and airflow controls specified under Division 23 HVAC; BACnet router/gateway to EMCS specified under Division 23 HVAC; with network connection specified under Section 23 09 00 Energy Management & Control Systems. Laboratory control vendor shall provide all necessary technical assistance to Division 23C contractor in mapping laboratory control points to the EMCS. [25] Section 23 09 00 Energy Management & Control Systems contractor to coordinate with Division 23 HVAC contractor to have controller and actuator factory mounted. [26] Factory wired control transformer, safeties and contactors with single point power wiring connection specified under Division 23 HVAC. [27] Shop drawings showing dimensions of all curbs, bases, etc. specified under Division 23 HVAC. [28] Shims to level curb specified under Division 6. Curb insulation specified under Division 23 HVAC. All roof curbs shall be approved by roofing manufacturer. [29] Additional T-bar or spline and cut ceiling tile as required to accept air outlets is specified under Division 9. [30] Dimensioning of access doors to mechanical equipment and coordination with Professional and Division 8 specified under Division 23.					

D. HVAC/Electrical Design Coordination

1. The power ratings of motors and other HVAC equipment and the electrical characteristics of electrical systems serving them, as specified herein and indicated on the Drawings, have been established as minimums which will allow that equipment to satisfactorily function while producing the required capacities. These power ratings include a safety factor deemed appropriate to accommodate common differences between design parameters and field construction practices. Under no circumstances shall equipment with power ratings less than those indicated on the Drawings or specified herein be provided.

2. Reasonable efforts have been made to coordinate the electrical requirements of the HVAC equipment with the electrical systems serving that equipment. Differences among manufacturers of HVAC equipment make it impossible to produce a single electrical design which will satisfy the varying electrical requirements of those manufacturers. Consequently, the Contractor shall coordinate the electrical requirements of the HVAC equipment actually furnished on this Project and provide the electrical systems required by that equipment. This coordination effort shall be completed prior to the installation of either the HVAC equipment or the electrical systems serving that equipment. Electrical system revisions required to coordinate with the HVAC equipment actually furnished shall be provided at no additional cost to the Using Agency.

E. Related Work Specified Elsewhere

1. Utilities five feet beyond building line unless noted otherwise: See Division 33 Utilities

2. Structural steel (except as specified herein): See Division 5 Metals.
3. Grates and railings protecting mechanical shaft and other floor openings: see Division 5 Metals.
4. Miscellaneous lumber and framing work, such as for framing, soffits and support of mechanical materials and equipment. See Division 6 Wood, Plastics, and Composites.
5. Undercutting of doors and door louvers: See Division 8 Openings.
6. Painting (except as specifically indicated): See Division 9 Finishes
7. Fire resistant enclosures around ducts and at fire dampers such as at the bottoms of shafts. See Division 9 Finishes.
8. Electric power, interlock and control wiring, except as specified herein.
9. Installation of starters, contactors, thermal overload switches, and remote push buttons, except as specified herein.
10. Fire alarm initiating devices, control modules, and monitoring modules.
11. Curbs, flashing, and pitch pockets for equipment on roof, except as specified herein.
12. Manhole construction.
13. Louvers and screens, except as specified herein.
14. Concrete equipment pads.

1.3 REFERENCE STANDARDS

A. Reference to codes, standards, specifications and recommendation of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Such codes or standards shall be considered a part of this Specification as though fully repeated herein.

B. Work shall be performed in accordance with all applicable requirements of the latest edition of all governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not.

C. Requirements of Regulatory Agencies

1. In accordance with the requirement of Division 1 General Requirements.
2. Nothing in contract documents shall be construed to permit work not conforming to current and applicable laws, ordinances, rules and regulations.
3. Where contract documents exceed requirements of applicable laws, ordinances, rules and regulations, comply with documents establishing the more stringent requirement.
4. It is not the intent of contract documents to repeat requirements of codes except where necessary for completeness or clarity.
5. Comply with the Safety Orders issued by OSHA and any other safety, health or environmental regulations of the State of Mississippi and any districts having jurisdictional authority. Where an omission or conflict appears between OSHA requirements and the Drawings and Specifications, OSHA requirements shall take precedence.
6. Applicable codes as listed below, in addition to others specified in individual sections.

    a. American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE) – Standard 90.1-2010 “Energy Standard for Buildings Except Low-Rise Residential Buildings”.
    b. International Building Code (IPC) – 2012.
    c. International Mechanical Code (IMC) – 2012.
    d. International Plumbing Code (IPC) - 2012.
    e. NFPA 1 – 2012, Fire Code
    f. NFPA 70 - 2008, National Electric Code
    g. NFPA 90A - 2009, Installation of Air Conditioning and Ventilating Systems

D. Published specifications, standards, tests or recommended method of trade, industry or governmental organizations as listed below apply to all work in Division 23 HVAC, in addition to other standards which may be specified in individual sections.

E. All base material shall meet ASTM and ANSI standards.

F. All Gas Fired Devices: Comply with standards and bear label of AGA.

G. All Pressure Vessels, Relief Valves, Safety Relief Valves and Safety Valves: Comply with standards, ASME stamped.

H. All Electrical Devices and Wiring

a. Conform to standards of NEC
b. All devices UL or ETL listed and identified

I. Guidelines and Standards: The latest edition of guidelines and standards published by the following govern the Mechanical Systems and associated support system design. The systems shall be designed to meet or exceed these guidelines and standards.

AABC	Associated Air Balance Council
ADC	Air Diffuser Balance Council
AGA	American Gas Association
AMCA	Air Movement and Control Association, Inc.
ANSI	American National Standards Institute
ARI	Air Conditioning and Refrigeration Institute
ASC	Adhesive and Sealant Council
ASHRAE	American Society of Heating, Refrigeration and Air Conditioning Engineers
ASME	American Society of Mechanical Engineers
ASSE	American Society of Sanitary Engineers
ASTM	American Society for Testing and Materials
AWWA	American Water Works Association
AWS	American Welding Society
ETL	Interlek Semko (Formerly Electrical Testing Laboratories)
GISO	General Industry Safety Orders
HI	Hydraulic Institute
ICBO	International Conference of Building Officials
IEEE	Institute of Electrical and Electronic Engineers
NBS	National Bureau of Standards
NEBB	National Environmental Balancing Bureau
NEC	National Electric Code
NEMA	National Electrical Manufacturer’s Association
NFPA	National Fire Protection Association
OSHA	Occupational Safety and Health Act
PDI	Plumbing and Drainage Institute
SMACNA	Sheet Metal and Air Conditioning Contractors National Association, Inc.
UL	Underwriter’s Laboratories, Inc.

1.4 QUALITY ASSURANCE

A. Supply all equipment and accessories in compliance with the applicable standards listed in Paragraph 1.3C and with all applicable national, state and local codes.

B. All equipment and accessories shall be new and the product of a manufacturer regularly engaged in its manufacturer.

C. All items of a given type shall be the products of same manufacturer.

D. All work in Division 23 HVAC shall be commissioned. See Section 01 91 00 Commissioning and Section 23 08 00 Mechanical Commissioning.

E. Workmanship, material and equipment shall be in accordance with Specifications and Drawings and in some instances the requirements exceed those required by codes and standards. Where not exceeded, the codes and standards shall be considered as absolute minimum requirements.

1.5 SUBMITTALS

A. No work may begin on any segment of this Project until the related submittals have been reviewed for conformance with the design intent and the Contractor has responded to all comments to the satisfaction of the Using Agency.

B. Submit drawings, product data, samples and certificates of compliance required as hereinafter specified. See also Division 1 – Shop Drawings, Product Data and Samples. Conditions in this Section take precedence over conditions in above referenced Section.

C. Submit no later than 35-days after signing of Contract, or as otherwise indicated by Professional. Submit a schedule indicating the proposed submission date of each submittal specified herein. Schedule shall anticipate the submittal review time, the possible need for resubmittals, and the time required for fabrication, shipping and integration into the construction sequence. Professional will advise of any conflicts in reviewing submittals that the proposed schedule presents.

1. Complete schedule of submittals for equipment and layout shop drawings. Allow 15-working days for review, unless Professional agrees to accelerated schedule.
2. List of all proposed substitutions: See Paragraph 1.7
3. Designate in schedule dates for submission and dates that reviewed shop drawings, product data and samples will be needed.
4. Provide submittals promptly in accordance with schedule and in such sequence as to cause no delay in work or in work of any other division.

D. Submit drawings, product data, samples and certificates of compliance required hereinafter specified.

1. See also Division1 Shop Drawings, Product Data and Samples. Conditions in this Section take precedence over conditions in above referenced Section.
2. Provide submittals promptly in accordance with schedule and in such sequence as to cause no delay in work or in work of any other division.
3. Submittals for each specification section shall be submitted in a single package. However, it is not required (nor desired) for all products to be submitted concurrently. Rather, submittals may be staggered based on schedule and required equipment release dates.
4. Allow 15-working days for review, unless the Professional agrees to accelerated schedule.
5. For substitutions, list any features or characteristics that are not strictly in compliance with specifications. If none are listed with the submittal, Contractor is guaranteeing that substituted product is functionally equivalent to the specified product in accordance with Paragraph 1.7.

6. Submittal reviews by the Professional are intended to assist the Contractor in complying with the design intent and requirements of the drawings and specifications. Reviews do not relieve the Contractor from compliance with these requirements and comments or lack thereof do not constitute approval of changes in these requirements.

E. Submission and Resubmission Procedure

1. Each submittal shall have a unique serial number that includes the associated specification section followed by a number for each sub-part of the submittal for that specification section, such as “SUBMITTAL 23 xx xx-01”.
2. Each resubmittal shall have the original unique serial number plus revision number such as “SUBMITTAL 23 xx xx-01 REVISION 1”.
3. Submit in format specified below. Submissions made in wrong format will be returned without action.

    a. Product Submittals: One copy in word-searchable electronic format per Paragraph 1.7A.4.b. Submit each specification section in a separate file named with unique name and number described above.
    b. Shop Drawings:

        1) One copy in electronic format .dwg, .dwf, or .pdf
        2) Two and only two copies on paper; any additional copies will not be returned without review

    c. Samples: As indicated in each specification section.

4. Professional will return a memo or mark-up of submittal with comments and connections noted where required.
5. Make corrections

    a. Revise initial submittal to resolve review comments and corrections.
    b. Indicate any changes that have been made other than those requested.
    c. Clearly identify resubmittal by original submittal number and revision number.

6. Resubmit revised submittals until no exceptions are taken.
7. Once submittals are accepted and stamped with no exceptions taken, provide

    a. Complete submittal of all accepted products in a single electronic file for each specification section.
    b. Photocopies for coordination with other trades, if and as required by the Contractor or Professional. Photocopies will serve as submittal for record and coordination.

F. Product Data Submittals

1. Contents

    a. Manufacturer’s name and model number
    b. All information required to completely describe materials and equipment and to indicate compliance with drawings and specifications, including, but not limited to:

        1) Schedule when more than one of each item is covered by submittal
        2) Physical data, as applicable

            a) Dimensions

b) Weight
c) Finishes and colors
d) Dimensional shop drawings

3) Performance data, as applicable

a) Rated capacities
b) Performance curve
c) Operating temperature and pressure
d) Efficiency

4) Flow and wiring diagrams as applicable
5) Description of system operation

c. All other pertinent information requested in individual sections

2. Format

a. See Division 1 Shop Drawings, Product Data and Samples
b. Identify clearly if submittal is substitution: Refer to Paragraph 1.8
c. Reference specification Division, Section, Title, Paragraph and Page number or drawing number as applicable
d. Use same nomenclature, legend, symbols and abbreviations on submittal material as used in contract documents

G. Layout Shop Drawings

1. Drawings shall be developed in format compatible with AutoCAD version 2010 or later.
2. Shop fabrication, coordination and installation drawings by the Contractor, are for the Contractor's use and shall be the Contractor's responsibility. These Drawings indicate where the Contractor intends to install the material and equipment as required by the Contract Documents. Do not submit shop fabrication documents unless requested. Use of contract documents or electronic files of contract documents for shop drawings is not sufficient.
3. Prepare and submit Shop Drawings for all Work deviating from that indicated on Contract Drawings. Clearly indicate deviations.
4. Review is not intended to verify dimensions or quantities, or to coordinate items shown on these Drawings. Review is for general conformance with design concept of the Project and general compliance with the information given in the Contract Documents. Contractor is responsible for dimensions, which shall be confirmed and correlated at the Jobsite, for fabrication processes and techniques or construction, for coordination of Work with that of all other trades and the satisfactory performance of Work.
5. Prepare and submit layout drawings, sections and details for following areas, minimum 1/4 inch scale:

a. Mechanical equipment rooms

6. Prepare layout shop drawings for all areas; minimum 1/4 inch scale.
7. Layout drawings, as a requirement of Division 23 HVAC, shall indicate, superimposed, Work of all Sections involved in congested area, including ductwork, piping, electrical work, ceiling work, etc. Include all mechanical rooms. Identification of space problems without solutions is not acceptable.
8. Individual coordinated trade layout drawings are to be prepared for all deviations from design documents.
9. Contractor is to assure that each trade has coordinated work with other trades, prior to

submittal where submittal is required.

a. Include stamp on each submittal indicating that layout shop drawing has been coordinated:
b. No layout shop drawing will be reviewed without stamped and signed coordinated assurance by Contractor.

10. All changes shall be clearly marked on each submitted layout drawing.
11. Drawings shall show work of all trades including but not limited to:

a. Ductwork
b. Piping: All Trades, including Fire Sprinklers and electrical installations
c. Mechanical Equipment

1) For fire and smoke dampers, tag each damper with a unique tag, starting with the tag on the drawings but adding a 4 digit number: xyzz where

a) x= AC or AH unit that serves the damper
b) y= floor
c) zz= unique consecutive number

d. Electrical Equipment
e. Main Electrical conduits and bus ducts
f. Equipment supports and suspension devices
g. Structural and architectural constraints
h. Show location of

1) Valves: manual and automatic
2) Piping specialties
3) Dampers: fire/smoke, automatic and manual volume, etc.
4) Access doors
5) Control and electrical panels
6) Others as required for clear coordination

12. Drawings shall indicate coordination with work specified in other Divisions which must be coordinated with work specified under Division 23 Mechanical, including, but not limited to:

a. Irrigation equipment and piping
b. Elevator equipment
c. Building vacuum cleaning systems
d. Pneumatic tube systems
e. Cable trays
f. Computer equipment
g. Others as required

13. Submission of drawings

a. See Division 1 – Shop Drawings, Product Data and Samples
b. Submit to other trades for review of space allocated to all trades
c. Revise drawings to compensate for requirements of existing conditions and conditions created by other trades
d. Ensure that each trade has coordinated work with other trades
e. Submit with stamps of General and all other applicable Contractors, initialed and signed certifying

1) Review of submittal
2) Verification of products, field measurements and field construction criteria
3) Coordination of information in submittal with requirements of work of this Division and other divisions of Contract Documents

f. No layout shop drawing will be reviewed without stamped and signed coordination assurance by the Contractor

H. Samples

1. Submit as required in each specification section

1.6 COMPLETION REQUIREMENTS

A. Procedure

1. Until the documents required in this section are submitted and approved, the system will not be considered “accepted”
2. Before requesting acceptance of work, submit one set of Completion Documents for review and approval of Professional
3. After review, furnish quantity of sets indicated below to Using Agency
4. Format

a. See Paragraph 1.6H for required format of Completion Documents
b. Paper copies; assemble in chronological order following alpha-numeric system used in specification, in heavy three-ring binder
c. Where electronic copies are called for in Paragraph 1.5H, comply with the following:

1) Provide in word-searchable electronic format; acceptable formats are MS Word, Adobe Acrobat (pdf) and HTML; submit other formats for review and approval prior to submission; scanned paper documents not acceptable
2) For submittals, provide separate file for each type of equipment
3) For Test & Balance report, provide separate files for each air handling system
4) Record drawings shall be in original format

B. Operating and Maintenance (O&M) Manual

1. See O&M Manual requirement herein

C. Record Drawings

1. Keep up-to-date during progress of job one set of Mechanical Drawings indicating the Record installation. In addition to changes made during course of Work, show following by dimension from readily obtained base lines

a. Fully illustrate all revisions made by all crafts in course of work
b. Include all field changes, adjustments, variances, substitutions and deletions, including all Change Orders
c. Exact location, type and function of concealed valves, dampers, controllers, piping, air vents and piping drains
d. Exact size, invert elevations and location of underground and under floor piping and ducts

1) Progress drawing set shall be available for inspection by Professional weekly
2) Update engineering design drawings and shop drawings to reflect revisions and additional data listed above at completion of Project

e. Original engineering design drawings will be provided to Contactor in electronic format compatible with AutoCAD version 2010 or later
f. Both shop and engineering design drawings shall be in format compatible with AutoCAD version 2010 or later
g. Drawings required to be updated if revisions were made

1) Floor plans
2) Shop drawings required by Paragraph 1.5G
3) Sections
4) Riser diagrams

D. Test and Balance Reports

1. See Section 23 05 93 – Testing, Adjusting and Balancing

E. Commissioning Reports

1. See Section 23 08 00 – Mechanical Commissioning and 23 09 00 – Energy Management & Control Systems

F. Training Materials

1. See Training Materials requirements herein

G. Miscellaneous Certificates

1. Pressure and Leakage Test documentation/certificates
2. Training/Instruction completion certificates
3. Fire Marshal and Fire Department approvals of system, as required
4. Final inspection certificate signed by governing authorities
5. Warranty period, including start and end period
6. Field test report, including as applicable
7. Start up documents with date and name of technician
8. Piping pressure tests
9. Flex coupled pump alignment verification
10. Duct leakage and pressure tests
11. Drain pan drainage tests
12. Letters from manufacturers certifying their supervision of equipment installation and start-up procedures
13. Machinery vibration test reports
14. Certificates of sterilization/chlorination of plumbing systems
15. Others as specified herein and in other Division 23 – Mechanical sections

H. Format of Completion Documents

1. Provide the type and quantity of media listed in table below
2. Optical media shall be readable on Operator Workstation: See Section 23 09 00 – Energy Management & Control Systems
3. Where indicated in table, the electronic files shall be stored on the EMCS systems' Operator Workstation and hyperlinked to the front-end DDC controls graphics so operators can get the

details of a certain device or balance reports by clicking on the link: See Section 23 09 00 – Energy Management & Control Systems

	Document	Paper (Binder or bound)	Electronic	
			Read only optical disk	Loaded Onto Operator Workstation
1	O&M Manuals	3	1	1
2	Record Drawings	2 Full size 2 Half size	1	1
3	Original issue EMCS software & manuals	1	1	1
4	Control sequences	1	1	1
5	Test and Balance Report	5	1	-
6	Commissioning Reports	5	1	-
7	Miscellaneous Certificates	1	-	-
8	Warranty documents	1	-	-
9	Training materials	1 per trainee	1	1

1.7 SUBSTITUTIONS AND PRODUCT OPTIONS

A. Contractor's Options

1. For products specified only by reference standard, select product meeting that standard, by any manufacturer
2. For products specified by naming one product or manufacturer, submit request for substitutions for any product or manufacturer which is not specifically named in accordance with substitutions clause
3. Wherever catalog numbers and specific brands or trade names are used, they are used to establish standards of quality, utility and appearance required

1.8 DESCRIPTION OF BID DOCUMENTS

A. The Contractor shall be responsible for becoming thoroughly acquainted with all Contract Document contents that affect his work under this contract. Work required under this section includes, but is not limited to, all material, equipment transportation, services and labor required to complete the entire mechanical system as required by the Contract Documents.

B. The Specifications and the associated Drawings are complimentary and any portion of the work described in one shall be provided as if described in both.

C. Specifications

1. Specifications, in general, describe quality and character of materials and equipment.
2. Specifications are of simplified form and include incomplete sentences.
3. Words or phrases such as "The Contractor shall," "shall be," "furnish," "provide," "a," "an," "the," and "all" have often been omitted from specifications for brevity.

D. Drawings

1. Drawings are diagrammatic in nature and, unless explicitly dimensioned, indicate approximate locations of apparatus, equipment, ductwork and piping. Changes in the location, and offsets, of same which are not shown on the Drawings but are necessary in order to accommodate building conditions and coordination with the work of other trades, shall be made during the preparation of coordination drawings and prior to initial installation, without additional cost to the Using Agency. Contractor shall install all system components in such a manner as to conform to the structure, avoid obstructions, preserve headroom, keep openings and passageways clear and maintain required servicing clearances without further instructions or additional cost to the Using Agency.
2. Scaled and figured dimensions are approximate and are for estimating purposes only. Indicated dimensions are limiting dimensions where noted. Duct and piping elevations are indicated for initial coordination; final requirements shall be determined by the Contractor after final coordination with other trades.
3. Before proceeding with work, check and verify all dimensions in field.
4. Assume all responsibility for fitting of materials and equipment to other parts of equipment and structure.
5. Make adjustments that may be necessary or requested in order to resolve space problems, preserve headroom and avoid architectural openings, structural members and work of other trades.
6. It is intended that all mechanical, plumbing and fire protection devices, piping, etc. be located symmetrically with all architectural elements. Refer to Architectural, Structural, Plumbing, Fire Protection, Mechanical and Electrical Specifications and Drawings in completing the required coordination.
7. The Contractor shall fully inform himself regarding any and all peculiarities and limitations of the spaces available for the installation of all work and materials furnished and installed under this Contract. He shall exercise due and particular caution to determine that all parts of his work are made readily accessible.
8. The Contractor shall study all drawings and specifications to determine any conflict with all applicable ordinances and statutes. Any discrepancies shall be reported to the Using Agency and any changes shall be shown on the as-built drawings with the additional work performed at no cost to the Using Agency.
9. The submittal of his bid shall indicate the Contractor has examined the site, drawings and specifications and has included all required allowances in his bid. No allowance shall be made for any error or omission resulting from the Contractor's failure to visit job site and to review drawings and specifications. The Contractor's bid shall include costs for all required drawings and changes as outlined above at no cost to the Using Agency.
10. Provide access to equipment and apparatus requiring operation, service or maintenance throughout the life of the system.

E. Do not use equipment exceeding dimensions indicated on drawings or equipment or arrangements that reduce required clearances or exceed specified maximum dimensions.

F. If any part of Specifications or Drawings appears unclear or contradictory, apply to Professional for an interpretation and decision prior to as early as possible.

1 Do not proceed with work without the decision of the Professional.

1.9 ALTERNATES

A. Refer to Section 01900 – Alternates for possible effect on this Section.

1.10 DEFINITIONS

A. In addition to those defined in Division 1 Specification 01090 – Reference Standards, the following additional definitions shall apply. Definitions of term used in Division 23 HVAC may differ from those given in general and supplementary conditions and take precedence over them.

B. “Provide”: to furnish, supply, install and connect up complete and ready safe and regular operation of particular work referred to unless specifically noted.

C. “Supply”: to purchase, procure, acquire and deliver complete with related accessories.

D. “Work”: includes labor, materials, apparatus, controls, equipment services and all related accessories necessary for the proper and complete installation of complete systems.

E. “Piping”: includes pipe, tube, fittings, flanges, valves, controls, strainers, hangers, supports, unions, traps, drains, insulation and all related accessories.

F. “Wiring”: includes raceway, fittings, wire, boxes and all related accessories.

G. “Concealed”: not in view, installed in masonry or other construction, within furred spaces, double partitions, hung ceiling, trenches, crawl spaces, or enclosures.

H. “Exposed”: in view, not installed underground or “concealed” as defined above. Exposed piping, conduit, or ductwork is that which can be seen when the building is complete without opening or removing access doors or panels or accessible ceiling components.

I. “Control or Actuated Devices”: includes automatic sensing and switching devices such as thermostats, pressure, float, flow, electro-pneumatic switches and electrodes controlling operation of equipment.

J. “Indicated,” “shown” or “noted”: as indicated, shown or noted on drawings or specifications.

K. “Reviewed,” “approved,” or “directed”, as reviewed, approved or directed by or to Using Agency.

L. “Motor Controllers”: starter, variable speed drives and other devices controlling the operation of motors.

1.11 PROJECT CONDITIONS

A. Examine site related work and surfaces before starting work of any Section.

1 In case of conflict, the most stringent takes precedence.
2 For purposes of clarity and legibility, Drawings are essentially diagrammatic to extent that many offsets, bends, unions, special fittings, exact locations of items are not indicated, unless specifically dimensioned. Especially note a number of required duct and pipe offsets to coordinate with structure and not shown. Coordinate dimensioned conditions, including invert elevations, with other trades prior to installation by any trade.
3 Exact routing of piping, ductwork, etc. shall be governed by structural conditions and other obstructions. Not all offsets in ductwork or piping are shown on the Drawings. Determine which item to offset or relocate. Maintain required slope in piping. Make use of data in Contract Documents. In addition, Professional reserves right, at no additional cost to the Using Agency, to make any reasonable change in location of mechanical items, exposed at ceiling or on walls, to group them into orderly relationships or increase their utility. Verify Using Agency’s requirements in this regard prior to rough-in.

4 Take dimensions, location of doors, partitions, similar physical features from Architectural Drawings. Verify at Site under this Division. Consult Architectural Drawings for exact location of outlets to center with Architectural features, panels, etc., at the appropriate location shown on Mechanical Drawings.
5 Mounting heights of brackets, outlets, etc., as required.
6 Report to Professional, in writing, conditions which will prevent proper provision of this work.
7 Beginning work of any Section without reporting unsuitable conditions to Professional constitutes acceptance of conditions by Contractor.
8 Perform any required removal, repair or replacement of this work caused by unsuitable conditions at no additional cost to the Using Agency.

B. Coordination

1 Work out all “tight” conditions involving Work specified under this Division and work in other Divisions in advance of installation, if necessary, and before Work proceeds in these areas, prepare supplementary Drawings under this Division for review showing all Work in congested area. Provide supplementary Drawings, additional Work necessary to overcome congested conditions, at no additional cost to the Using Agency.
2 Conflicts: Difference or disputes concerning coordination, interference or extent of Work between sections shall be decided as follows:

a. Install mechanical and electrical systems in the following order of preference (those trades listed below another must reroute to resolve the conflict):

1) Drain piping required by code to be sloped
2) Supply air and exhaust air ductwork connected to fans
3) Electrical conduit 4 inches and larger
4) Hydronic piping connected to pumps
5) Domestic water piping
6) Fire sprinkler piping
7) Electrical conduit smaller than 4 inches
8) Transfer ducts and other ductwork not connected to fans
9) Control system piping and wiring

b. Continued disputes shall be decided by Contractor and Contractor’s decision, if consistent with Contract Document requirements, shall be final.

3 Supervision: Personally or through an authorized and competent representative, constantly supervise the work from beginning to completion and, within reason, keep the same foreman and workmen on the Project throughout the Project duration.
4 Provide templates, information and instructions to other Divisions to properly locate hides and openings to be cut or provided.
5 The drawings govern in matters of quantity, and the specifications govern in matters of quality. In the event of conflict within the drawings involving quantities, or within the specifications involving quantities, or within the specifications involving quality, the greater quantity and higher quality shall apply. Such discrepancies shall be noted and clarified in the Bid. No additional allowances will be made because of errors, ambiguities, or omissions that reasonably should have been discovered during the preparation of the Bid.

C. Equipment Rough-in

1 Rough-in locations shown on Mechanical Drawings for equipment furnished by the Using Agency and for equipment furnished under other Divisions are approximate only. Obtain exact rough-in locations from following sources.

a. From Shop Drawings for equipment provided under this contract
b. From Professional for Using Agency furnished-Contractor installed equipment
c. From existing equipment where such equipment is relocated under this Contract

2 Verify mechanical characteristics of equipment before starting rough-in. Where conflict exists between equipment and rough-in shown on Drawings obtain clarification from Professional and provide as directed by the Professional at no additional cost to the Using Agency.
3 Make final connections

1.12 CLEARANCE FROM ELECTRICAL EQUIPMENT

A. Piping, equipment or ductwork

1 Prohibited, except as noted in:

a. Electric rooms and closets over equipment, as restricted by NEC.
b. Telephone rooms and closets
c. Elevator machine rooms
d. Elevator shafts
e. Electrical switchboard room

2 Prohibited, except as noted, over or within 5 feet of:

a. Transformers
b. Substations
c. Switchboards
d. Motor control centers
e. Standby power plant
f. Bus ducts
g. Electrical panels
h. Variable frequency drives
i. Starters

B. Drip pans under piping

1 Where piping is located over any electrical equipment listed above; reroute piping if possible rather than use drip pan
2 28 gage galvanized steel
3 18 gage copper
4 Reinforced and supported
5 Watertight
6 With 1-1/4 inch drain outlet piped to floor drain or service sink

C. Electrical Working Space: Dimensions of the working space shall be a minimum depth of 42" horizontally, the width of the equipment or 30", whichever is greater, and the height of the equipment or 78", whichever is greater. Minimum depth shall be increased to 60" for equipment rated over 600 V.

1.13 PRODUCT DELIVERY, HANDLING AND STORAGE

A. See Division 1 Product Requirements

B. Deliver equipment in its original package to prevent damage or entrance of foreign matter. Provide materials on factory provided shipping skids and lifting lugs if required for handling. Provide protective coverings during construction.

C. Handle and ship in accordance with manufacturer's recommendations

D. Identify materials and equipment delivered to Site to permit check against approved materials list, reviewed with no exceptions taken Shop Drawings

E. Protect from loss or damage. Replace lost or damaged materials and equipment with new at no additional cost to Using Agency

F. Where necessary, ship in crated sections of size to permit passing through available space

1.14 PROJECT MANAGEMENT AND COORDINATION SERVICES

A. See Division 1 Project Coordination

B. Overview: Provide a project manager/engineer for the duration of the Project to coordinate the Division 23 HVAC work with all other trades. Coordination services, procedures and documentation responsibility shall include, but shall not be limited to the items listed in this section.

C. Review of shop drawings prepared by other subcontractors

1. Obtain copies of all shop drawings for equipment provided by others that require electrical service connections or interface with Division 23 HVAC work.
2. Perform a thorough review of the shop drawings to confirm compliance with the service requirements contained in the Division 23 HVAC contract documents. Document and discrepancy or deviation as follows:

    a. Prepare memo summarizing the discrepancy
    b. Provide a copy of the specific shop drawing, indicating via cloud, the discrepancy

3. Prepare and maintain a shop drawing review log indicating the following information

    a. Shop drawing number and brief description of the system/material
    b. Date of you review
    c. Indication if follow-up coordination is required

D. Request for information (RFI)

    a. See Division 1 Request for Information

1.15 REVIEW OF CONSTRUCTION

A. Work may be reviewed at any time by representatives of the Using Agency and/or Professional.

B. Advise Using Agency that work is ready for review at the following times

1. Prior to backfilling buried work.
2. Prior to concealment of work in walls and above ceilings.

3. When all requirements of Contract have been completed.
4. When testing will be performed.

C. Do not backfill or conceal work without Professional's consent.

D. Maintain on site, one set of Specifications and Drawings for use by Using Agency and/or Professional.

1. Include all change orders

E. Contactor is responsible for construction methods, sequences and safety precautions

1.16 SCHEDULE OF WORK

A. In accordance with Division 1 Contract Schedules and as follows:

1. Arrange work to conform to schedule of construction established or required to comply with Contract Documents
2. In scheduling, anticipate means of installing equipment through available openings in structure

B. Confirm in writing to Professional, within 35-days of signing of contract, anticipated number of days required to perform test, balance, acceptance testing and commissioning of mechanical systems. Schedule test balance and acceptance testing of mechanical systems as follows:

1. Submit for review at this time, names and qualifications of test and balancing agencies to be used
2. Test, Adjusting and Balancing and commissioning must occur after completion of mechanical systems, including all control calibration and adjustment, and requires substantial completion of the building, including closure, ceilings, lighting, partitioning, etc.
3. Allow 21-days after test and balance for system commissioning and life safety testing (where applicable)
4. Complete and test all systems early enough to enable completion of commissioning prior to Using Agency move-in.

1.17 CUTTING AND PATCHING

A. See Division 1 Cutting, Patching and Matching

1.18 UTILITY CONNECTIONS

A. Utilities include but are not limited to, water, sanitary sewer, storm sewer, natural gas, fire protection water, chilled water, heating water, steam, Energy Management and Control System, etc.

B. See Paragraph 1.2E.1

C. Connect to utility company mains as required. Include all meters and other ancillary components required by serving utility company.

D. Connect to on-site piping mains

E. Contractor shall be responsible for payment of all service charges

F. Contractor shall be responsible for provisions for temporary utilities

G. (Others as required)

1.19 WARRANTY

A. In accordance with Division 1 Guarantees, Warranties, Bonds, Service & Maintenance Contracts and as follows.

B. Warranty all materials, equipment, apparatus and workmanship to be free of defective materials and faulty workmanship for a period of one year from and after date of acceptance of completed contract.

C. Provide new materials, equipment, apparatus and labor to replace that determined by Professional to be defective or faulty.

D. This guarantee also applies to services including instructions, adjusting, testing, noise, balancing, etc.

E. Furnish Manufacturer's standard Warranties in excess of one year.

F. Refrigerant compressors to have an additional four year parts warranty.

G. Nothing herein intends or implies that guarantee shall apply to work which has been abused or neglected by the Using Agency or the Using Agency's successor in interest.

1.20 PERMITS

A. Obtain all permits, certificates of inspections, patent rights and licenses that are required for the performing of this work by all laws, ordinances, rules and regulations or orders of any officer and/or body. Provide all notices necessary in connection therewith, and pay all fees relating thereto and all costs and expenses incurred on account thereof. No work shall be covered before inspection by the jurisdiction authorities and observation by the Professional.

1.21 CONTINUITY OF EXISTING SERVICE AND SYSTEMS

A. Schedule work so existing systems will not be interrupted. Obtain approval from the Using Agency and Professional at least 14 days prior to any utility interruption or connection.

B. Perform work at such time and in such a manner as to cause minimum inconvenience to the Using Agency and as approved by the Professional. No allowance will be made for lack of knowledge of existing conditions.

C. Connections to existing work:

1 Install new work and connect to existing work with minimum interference to existing facilities.
2 Connect new work to existing work in neat and acceptable manner. Restore existing disturbed

work to original condition.

D. Removal and relocation of existing work.

1 Disconnect, remove or relocate piping, ductwork, conduit, and other work noted or required by alterations, modifications or changes in existing construction.
2 Plug or cap affected active lines behind or below finished walls and/or floors.
3 Dispose of removed piping and material.

E. Special Traffic Requirements:

1 Maintain emergency and service entrances so they are usable for pedestrian, truck and emergency vehicles at all times.
2 Where trenches are cut, provide adequate bridging for above-mentioned traffic.

1.22 PROVISION FOR FUTURE ADDITIONS

A. The design contemplates future additions. Provisions for these additions are indicated on the Drawings. All work conducted as part of this contract shall be completed with the future additions accounted for. Rework associated with system components installed in locations that will disrupt the future additions shall be performed at no cost to the Using Agency.

1.23 PROCEDURE OF WORK

A. Before any of the work within the scope of this contract is begun, the Contractor shall confer with the Professional and agree on a sequence of procedure for performing the work.

B. The Contractor is hereby cautioned that although he will be permitted to conduct his work during regular working hours (see exceptions below), his work shall be performed in such a manner so as not to interfere with the conduct of regular business unless approval for such interference has been obtained from the Using Agency and Professional. No reimbursement shall be made to the Contractor for losses sustained due to delays and interruptions of his work to accommodate the operation and business of the Using Agency.

C. Regular working hours exceptions: Extended utilities shutdowns and/or major equipment changeouts.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Listed “Acceptable Manufacturers” are those considered capable of manufacturing products or equipment conforming to detailed Specifications and Schedules, and as such, are invited to compete provided the offering is comparable in every respect to scheduled or specified products and actually conforms to the detailed Specifications and Schedule requirements. Listing herein as “Acceptable Manufacturers” does not imply “Accepted”, “Approved”, “Prior Approval” or any other connotation. All product offerings must be submitted for approval after Contract Award.

B. Alternate manufacturers as identified in each section will be considered under conditions specified in Paragraph 1.5 of this section.

C. Identify materials, equipment by manufacturer's name, nameplate data. Remove unidentified materials, equipment from Site.

D. Equipment specified by manufacturer's number shall include all accessories, controls, etc., listed in catalog as standard with equipment. Furnish optional or additional accessories as specified.

E. Where no specific make of material or equipment is mentioned, any first class product of reputable manufacturer may be used, provided it conforms to requirements of system and meets with acceptance.

F. Provide an authorized representative to constantly supervise work of this Division, check all materials prior to installation for conformance with Drawings, Specifications, reviewed Submittals and reviewed Shop Drawings.

G. Conform to conditions shown and specified. Coordinate with other trades for best possible assembly of combined Work. Relocate equipment when necessitated by failures to coordinate Work or to advise Professional of conflicts in writing.

H. Material and Equipment-General Requirements

1. New
2. Approved for use by State Fire Marshal and local building inspection department when applicable
3. Testing agency labeled or with other identification wherever standards have been established
4. Professional reserves right to reject items not in accordance with Specification either before or after installation
5. Comprised to render complete and operable systems; provide additional items needed to complete installation to realized design
6. Compatible with space allocated; modifications necessary to adjust items to space limitations at Contractor's expense
7. Installed fully operating and without objectionable noise or vibration
8. Design of mechanical systems is generally based on product of the first named manufacturers cited. Where systems for product installed necessitate modification of systems shown on drawings, Contractor is responsible for installation of systems appropriate to product installed.

I. Electrical Requirements

1. Electrical Work performed under Division 23 – Mechanical shall conform to requirements of Division 26 Electrical
2. Provide weatherproof devices and installation for out-of-doors work

2.2 PAINTING

A. Finish painting (other than factory applied) of mechanical equipment and associated piping and ductwork shall be as specified in Division 09 “Painting” Section(s). Provide touch up painting of prefinished mechanical products.

1 All equipment, ductwork, piping conduit and associated supports, attachments, hardware and connectors exposed to the weather shall be properly coated, painted or otherwise protected from corrosion caused by the elements (sun, wind, rain, snow, ice, etc.).

B. Surfaces shall be left clean, debris shall be removed, and equipment shall be furnished in prime coat finish ready for finish coats.

1 Piping, Ductwork and Equipment: Clean exterior of piping, ductwork and equipment removing rust, plaster and dirt by wire brushing. Remove grease, oil and similar materials by wiping with clean rags and suitable solvents.
2 Motors, Pumps and Other Items with Factory Finish: Remove grease and oil and leave surfaces clean and polished.

C. Cleaning operations may be supplemented by more detailed instructions in various other Sections of this Specification.

D. Paint for high temperature piping and equipment shall be high temperature resistant, designed for the temperatures at which the system will operate.

PART 3 - EXECUTION

3.1 INSPECTION

A. Verify that conditions are satisfactory for the installation of materials and equipment. Notify Professional if conditions are not satisfactory and do not commence work until conditions have been corrected.

3.2 INSTALLATION

A. Install materials and equipment in compliance with governing codes.

B. Use printed descriptions, specifications and recommendations of manufacturers as a guide for installation of Work. Follow in all cases where manufacturers' of articles used furnish directions covering points not specified or shown.

C. Equipment

1. See Division 1 – Supporting From Building Structure
2. Assemble equipment which is required to be field assembled under the direct supervision of the manufacturers' agent
3. Prior to the final acceptance submit letters from the manufacturers that equipment has been assembled under the direct supervision of the manufacturers' agent
4. Accurately set and level equipment with supports neatly placed and properly fastened
5. Properly fasten equipment in place with bolts to prevent movement
6. Coordinate the installation of equipment with openings in structure
7. Coordinate and fully dimension steel supports for mechanical equipment where shown on drawings with installing contractor
8. Provide all roof curbs for roof mounted fans, flues, piping and duct penetrations, etc.
9. Concrete

a. Concrete work, include forming, steel bar reinforcing, cast-in-place concrete, finishing and grouting is specified under Division 3 Concrete
b. Coordinate and fully dimension concrete housekeeping pads and curbs with installing

contractor; dimensions shall be as required for structural requirements, see Section 23 05 48 – Mechanical Sound and Vibration Control

c. Coordinate inertia base fill with installing contractor

D. Electrical

1. See Division 26 Electrical
2. Install electrical devices with code required clearances and access
3. Assist the electrical contractor in the proper connecting of all electrical wiring and equipment required for mechanical equipment

E. Sleeves, Chases and Concrete Inserts

1. Provide all required sleeves, chases, concrete inserts, anchor bolts, etc.
2. Sleeves, chases are prohibited in structural members, except where shown or as directed by Professional in writing
3. Embed no piping in concrete or masonry

F. Waterproof Construction

1. Comply with Division 7 – Thermal and Moisture Protection
2. Include membrane clamps, sheet metal flashing, counter flashing, caulking and sealant as required for waterproofing of mechanical penetrations and sealing penetrations in or through fire walls, floors, ceiling slabs and foundation walls
3. All penetrations through vapor barriers at slabs on grade shall be taped and made vapor tight
4. Provide galvanized sheet metal weather protection canopies, hoods or enclosures over all out-of-doors equipment, the operation or maintenance of which would be impaired by rain water; this requirement applies to damper operators and bearing, damper motors, controls and instruments; see other Sections in this Division for application of this requirement to motors, drive, ducts and fans

G. Restoration of Damage

1. Repair or replace, as directed by Professional, materials and parts of premises which become damaged
2. Remove replaced parts from premises at no additional cost to the Using Agency

H. Review architectural drawings and coordinate with Professional and other contractors to be sure that all architectural shafts, plenums, rated duct enclosures etc. required for mechanical systems are properly located and dimensioned.

I. Access Panels and Doors

1. Product specified under Section 23 05 00 – Basic Mechanical Materials and Methods

   a. Coordinate size requirements and exact location with Contractor who will install access doors
   b. Minimum Sizes: 18 inches by 18 inches unless otherwise shown on Drawings or approved by Professional

2. Provide where shown, or required by Regulatory Agencies, for access of all concealed equipment such as terminal units, valves, fire/smoke dampers, etc., for Mechanical Work:

a. Equipment shall be located wherever practical over accessible ceilings or rooms to avoid access doors
b. Access doors shall not be used solely for access to balancing dampers; use instead remote control devices specified under Section 23 33 00 – Duct Accessories

J. Openings

1. Coordinate and fully dimension all openings in walls, floors, roofs and structural elements required for mechanical work
2. Provide all required fire-stopping around pipe, duct and other penetrations required for mechanical work in rated partitions where required by code
3. Fire damper openings: Contractor shall provided damper UL installation requirements to contractor installing partitions to ensure construction complies with listing
4. Air outlet openings

a. Contractor shall coordinate exact locations of air outlets in floors, walls and ceilings with contractor installing partition
b. Contractor shall coordinate additional T-bar or spline required to accept air outlets with contractor providing and installing ceiling and associated materials

3.3 PROTECTION OF EQUIPMENT AND MATERIALS DURING CONSTRUCTION

A. See Division 1 – Product Requirements

B. Provide protective covers, skids, plugs or caps to protect equipment and materials from damage or deterioration during construction.

C. Store equipment and material under cover, and off the ground or floors exposed to rain.

D. For outdoor storage, protective covers of 10 mil thick black sheet plastic shall be fitted over equipment and materials. Covers shall be reinforced to withstand wind and precipitation. Set equipment and material on skids or platforms of height to avoid damage or deterioration from spattering and ground water.

E. Protect coils against damage by installing temporary closure panels over exposed coil faces. Panels shall be minimum 24 gauge sheet metal or 0.375" plywood.

F. Completely cover motors and other moving machinery to protect from dirt and water during construction

G. Close open ends of fans, air valves, terminal units, energy recovery units, air handling units, and ductwork with temporary closures of sheet plastic taped in place.

H. Plug ends of pipes when work is stopped to prevent debris from entering the pipes.

I. Provide dust and debris protection for ductwork, coils, fans, equipment, motors, and bearings operated during construction up to date of substantial completion.

J. Cover open ends of exhaust and return ducts with temporary filter media while fan systems are operating.

K. Material, equipment or apparatus damaged because of improper storage or protection will be rejected

1. Remove from site and provide new, duplicate, material, equipment or apparatus in replacement of that rejected
2. Any porous materials, such as duct liner, insulation or flexible ductwork that becomes wet; for example, due to rain shall be replaced; drying is not sufficient (due to possible microbial contamination)

L. Perform Work in manner precluding unnecessary fire hazard

3.4 ADJUSTMENT

A. Preliminary Operation

1. Operate any portion of installation for Using Agency's convenience if so requested by Professional. Such operation does not constitute acceptance of Work as complete but does constitute beneficial use, see Paragraph 1.19B. Cost of utilities, such as gas and electrical power, will be borne by the Using Agency if operation is requested by Using Agency.

B. Startup Service

1. Prior to startup, ensure that systems are ready, including checking the following: Proper equipment rotation, proper wiring, auxiliary connections, lubrications, venting fan balance, controls and installed and properly set relief and safety valves. See pre-function tests in Division 23 – Mechanical.
2. Start and operate all systems
3. Provide services of factory trained technicians for startup of major equipment and systems including boilers, chillers, fire pumps, etc.
4. Adjusting: See Section 23 05 93 – Testing, Adjusting and Balancing
5. Functional Testing: See Section 23 09 00 – Energy Management & Control Systems
6. Life Safety Testing

    a. Assist Division 26 Electrical contractor in testing fire alarm controls, including control of smoke dampers and shut-off of fan systems
    b. Correct any problems related to equipment supplied under Division 23 – Mechanical
    c. Complete the control matrix with details such as fan tags, FSD tags, etc. based on control matrix provided with Life Safety Report
    d. Assist Life Safety System commissioning agent in testing and commissioning Life Safety System
    e. Provide all tests, air balance and start-up personnel required to start and commissioning the system and for assisting the design/construct team in demonstrating system compliance with the local fire district and building department

C. Noise

1. Cooperate in reducing any objectionable noise or vibration caused by mechanical systems to the extent of adjustments to specified and installed equipment and appurtenances
2. Completely correct noise problems caused by failure to make installation in accordance with Contract Documents, including labor and materials required as a result of such failure, at no additional cost to the Using Agency

3.5 SPECIAL TOOLS

A. Furnish to Using Agency at completion of work

1. One set of any special tools required to operate, adjust, dismantle or repair equipment furnished under any section of this Division
2. Pressure gage and temperature sensor for piping test plug

3.6 CLEANING

A. Cleaning

1. See Division 1 – Closeout Procedures, Final Cleaning and Extra Material

B. Thoroughly clean equipment, fans, pumps, motors, piping and other materials under this Division free from all rust, scale and all other dirt before any covering or painting is done, or the systems put in operation; leave in condition satisfactory to Professional

C. At all times keep the premises free from accumulation of waste material and debris caused by his employees. At the completion of the Project, and at other times as Professional may direct, remove refuse from within and around the building. All tools, scaffolding and surplus materials shall also be removed, leaving the Site of his Work clean.

D. Completely cover all plumbing fixtures and all motors and other moving machinery to prevent entry of dirt and water during construction

E. Effectively cap all openings into ducts and pipes to keep moisture and foreign matter out during construction

F. Clean and polish identification plates

G. Clean equipment, ductwork, insulation, piping, conduit, and room surfaces from dust and dirt and maintain in a clean condition from date of substantial completion until final completion of work and corrective work.

3.7 PAINTING

A. Cleaning

1. See Division 1 – Closeout Procedures, Final Cleaning and Extra Material

B. Painting

1. Piping exposed to outdoors and where indicated elsewhere

a. One coat primer
b. Two coat alkyd oil paint, UV resistant for PVC piping, color as indicated
c. Not required for copper, galvanized steel, or insulated piping

2. Steel hangers and supports exposed to outdoors

a. One coat primer

b. Not required for galvanized steel

3. Interior of ductwork and duct accessories, including insulation stick pins, at air outlets as far back as visible from occupied spaces

a. Flat black

4. Marred surfaces of factory painted equipment

a. Spot coat to match adjacent coat

5. Insulation exposed to sunlight: See Section 23 07 00 – Mechanical Insulation

C. Execution

1. Protect flooring and equipment with drip cloths
2. Paint and materials stored in location where directed
3. Oily rags and waste removed from building every night
4. Wire brush and clean off all oil, dirt and grease areas to be painted before paint if applied
5. Workmanship

a. No painting or finishing shall be done with

1) Dust laden air
2) Unsuitable weather conditions
3) Space temperature below 60 degrees Fahrenheit

b. Pipes painted containing no heat and remain cold until paint is dried
c. Paint spread with uniform and proper film thickness showing no runs, sags, crawls or other defects
d. Finished surfaces shall be uniform in sheen, color and texture
e. All coats thoroughly dry before succeeding coats are applied, minimum 24 hours between coats
f. Priming undercoat of slightly different color for inspection purposes

6. Piping continuously painted in all exposed areas

D. Paint

1. High gloss medium or long alkyd paint
2. Best grade for its purpose
3. Deliver in original sealed containers
4. Apply in accordance with manufacturers instructions

E. Colors

1. Colors as directed by Professional unless specified herein.
2. Interior of ductwork as far back as visible from outside: flat black
3. Uncoated hangers, supports, rods and insets: dip in zinc chromate primer

F. Factory finish

1. Ceiling and wall mounted air outlets in acoustical tile ceilings: Baked white enamel

2. Aluminum air outlets that are not to be painted: anodized
3. Exposed fan coil units: baked enamel
4. Unit ventilators and unit heaters: baked enamel
5. Fans, pumps, compressors, tanks and like items
6. Air handlers, pumps, water heaters and like items where exposed

G. Marred surfaces of prime coated equipment and piping: spot prime coat to match adjacent coat

H. Properly prepare Work under this Division to be finish painted under Division 9 Painting

I. Provide moisture resistant paint for exterior painting and heat resisting paint for hot piping, equipment and materials

J. For the following, provide factory prime coat. Also, provide factory finish painting on each if not specified in Painting Division

1. Other air outlets

K. Paint all equipment out-of-doors and equipment supports with two coats of weather resistant enamel

L. Protect all finished surfaces of fixtures with heavy paper pasted thereon, or by other means, throughout the period of construction

M. Refinish Work supplied with final finish under this Division if damaged under this Division to satisfaction of Professional

3.8 FIELD QUALITY CONTROL

A. See Division 1 – Quality Control

B. Tests

1. Perform as specified in individual sections and as required by authorities having jurisdiction
2. Perform commissioning work

a. Perform pre-function tests as specified in Division 23 – Mechanical
b. Perform functional and post-occupancy tests. See Section 23 09 00 – Energy Management & Control Systems

3. Duration as noted

C. Provide required labor, material, equipment and connections
D. Furnish written report and certification that tests have been satisfactorily completed
E. Repair or replace defective work, as directed by Professional in writing, at no additional cost to the Using Agency
F. Restore or replace damaged work due to tests as directed by Professional in writing, at no additional cost to the Using Agency
G. Restore or replace damaged work of others, due to tests, as directed by Professional in writing, at no additional cost to the Using Agency
H. Remedial work shall be performed to the satisfaction of the Professional, at no additional cost to the Using Agency, including

1. Work related to all Division 23 – Mechanical pre-functional tests
2. Division 23 – Mechanical work related to Section 01 91 00 – Commissioning
3. Division 23 – Mechanical work related to Section 23 05 93 – Testing, Adjusting and Balancing
4. Division 23 – Mechanical work related to Section 23 08 00 – Mechanical Commissioning

I. Remedial work shall include performing any commissioning or other tests related to remedial work an additional time at no additional cost to the Using Agency

3.9 EXISTING EQUIPMENT AND SYSTEMS

A. Material and equipment which has been removed and not accepted by the Using Agency shall become the property of the Contractor and shall be removed from the site.

B. Material and equipment which has been removed shall not be used in the new work, except as specified herein.

C. Where existing piping, ductwork and equipment is indicated on the Drawings, its size and location shall be verified.

3.10 EQUIPMENT AND INSTALLATION REQUIREMENTS

A. Air systems shall operate without aerodynamic noise generated from the faulty installation of ductwork or any component of the air distribution system.

B. Equipment shall be installed and connected as specified herein or indicated on the Drawings in accordance with the manufacturers' instructions and recommendations for this Project. Furnish and install auxiliary piping, water seals, valves, and electrical connections recommended by the manufacturer for operation.

C. Provide roughing, fittings, accessories, and connecting piping, and make final connections to all equipment. Coordinate carefully with equipment vendor prior to starting rough-in work.

D. In unfinished areas designated for future build-out, install piping, ductwork, conduit and equipment tight against the structure to maximize future ceiling height.

E. Motor quantities, sizes and equipment wattage ratings specified herein or indicated on the Drawings are the minimum requirements, unless noted otherwise. Motor quantities, sizes and equipment wattage ratings less than those specified herein or indicated on the Drawings are not acceptable. Larger motor sizes and equipment wattage ratings may only be provided if necessary to meet the prescriptive requirements specified herein or indicated on the Drawings. Where multiple motors or motor sizes or equipment wattage ratings larger than specified herein or indicated on the Drawings are furnished, provide and coordinate the corresponding increased number or capacity of feeders and other electrical equipment serving them, at no additional cost to the Using Agency.

F. Fans, drive sheaves, motors, and pumps shall be statically and dynamically aligned and balanced. Each shall have steady state radial vibration levels which do not exceed the following:

Equipment	Peak-to-Peak Displacement (mils)
Fans, drive sheaves, and motors	
under 600 rpm	4

600 to 1000 rpm	3
1000 to 2000 rpm	2
over 2000 rpm	1
Pumps and motors	
over 1800 rpm	1
under 1800 rpm	2

G. Field-installed equipment controls or sensor wiring shall be installed in conduit. Low voltage control and sensor wiring shall be installed in conduits separate from line voltage control wiring and power wiring.

H. Where water connection sizes at equipment vary from the pipe size indicated on the Drawings, provide appropriate reducers/increasers directly adjacent to the pipe-equipment unions. Unless otherwise specified herein or indicated on the Drawings, the size of the valves and accessories dedicated to the equipment shall not be less than the pipe size to which they are connected.

I. Install all work so that parts requiring periodic inspection, operation, maintenance and repair are readily accessible and with the manufacturer's minimum required clearances provided. Minor deviations from the drawings may be made to accomplish this, but changes of substantial magnitude shall not be made without written approval.

1 Group concealed valves, controls and equipment requiring access, so as to be freely accessible through access doors.

3.11 EXCAVATION AND BACKFILLING

A. In accordance with the requirements of Division 31 for excavating, trenching, and backfilling.

B. Provide barricades, signs, lanterns, shoring, sheeting and pumping as part of Work in this Division as required to ensure safe conditions. Comply with OSHA requirements

C. Dig trenches straight, true to line and grade with sides and bottoms smoothed of any rock points

1 Excavate 6 inches below grade of pipe
2 Fill with sand properly packed
3 Support pipe for entire length on packed sand
4 Shape or pack bottom of trenches for pipe, duct fittings, hubs, couplings, etc., using templates to fit outside periphery of lower third of piping and ductwork
5 Provide piping outside building with 36-inch minimum cover from top of pipe to finished grade
6 Minimum width 16 inches

D. Dispose of all surplus excavation material and seepage water as directed by the Professional

E. Backfill

1 After piping has been installed, tested and approved, backfill all excavation, tamp and compact by compressed air tampers
2 Backfill to 6-inches above crown of pipe with unwashed sand, with remainder of trench back-filled and mechanically tamped in 6-inch maximum layers of selected excavated materials, free from organic matter, rocks, etc. Provide 90-percent compaction in accordance with ASTM D 1557-58T; 95-percent compaction for trenches below building slabs.

F. In any asphalt or concrete paved areas, backfill only to subgrade level

G. When piping is installed, prior to backfilling, advise Professional; do not backfill without acceptances of Professional

H. Replace to original condition all paving, curbs, gutters, walks, etc., which become disturbed by trenching

3.12 OPERATION AND MAINTENANCE MANUALS

A. These operation and maintenance manual requirements supplement operation and maintenance manual documentation requirements of other Sections of these specifications.

B. Operation and maintenance documentation, in hardback 3-ring loose-leaf binders except full size drawings and CDs, shall cover the HVAC and building automation systems. Documentation shall include an operations and maintenance documentation directory, emergency information, operating manual, maintenance manual, test reports, and construction documents.

C. Initial Submittal: The operation and maintenance documentation package shall be submitted as one comprehensive package to the Using Agency 1 month before systems start-up, and shall be updated, revised and completed at completion of construction.

D. Final Submittal: Provide four (4) complete manuals.

1. Correct or modify each manual to comply with Professional's comments. Submit Final manuals shall be submitted 15 working days prior to demonstration and training of Using Agency's personnel. Manuals are to be used in training sessions by Using Agency's personnel.

E. Compile and coordinate the documentation for equipment and systems installed. Unless otherwise indicated, organize each manual into a separate section for each system and subsystem and a separate section for each piece of equipment not part of a system. Documentation shall be typewritten and shall contain, at a minimum, the following information.

1. Introduction:

   a. Project name, contractors' and subcontractors' names, addresses, telephone numbers, email addresses and facsimile numbers. Indicate the portion of the work for which each subcontractor was responsible.
   b. List of Documents
   c. List of systems
   d. List of equipment
   e. Table of Contents.

2. Operations and Maintenance Documentation Directory:

   a. Explanation of the identification system used, including lists of systems, equipment, and component identifiers and names. Use the same system, subsystem and equipment designation as used in the Contract Documents. If no designation exists, assign a designation according to ASHRAE Guideline 4, "Preparation of Operating and Maintenance Documentation for Building Systems."

3. Manual Organization: Unless otherwise indicated, organize each manual and into a separate

section for each system and subsystem, and a separate section for each piece of equipment not part of a system. Each manual shall contain the following materials, in the order listed:

a. Title page
b. Table of contents
c. Manual contents

4. Manual Title Page: Enclose title page in transparent plastic sleeve. Include the following information:

   a. Project name, contractors' and subcontractors' names, addresses, telephone numbers, email addresses and facsimile numbers. Indicate the portion of the work for which each subcontractor was responsible.
   b. Subject matter included in manual
   c. Name and address of Project
   d. Name and address of Using Agency
   e. Date of submittal
   f. Name, address, telephone number, fax number and email address of Contractor
   g. Name and address of Professional and other Professionals
   h. Cross-reference to related systems in other operation and maintenance manuals.

5. Manual Table of Contents: List each product included in manual, identified by product name, indexed to the content of the volume and cross-referenced to Specification Section number in Project Manual.

   a. If operation or maintenance documentation requires more than one volume to accommodate data, include comprehensive table for all volumes in each volume of the set.

6. Manual Contents: Organize into sets of manageable size. Arrange contents alphabetically by system, subsystem and equipment. If possible, assemble instructions for subsystems, equipment and components of one system into a single binder.

   a. Binders: Heavy-duty, 3-ring, vinyl-covered, loose-leaf binders, in thickness necessary to accommodate contents, sized to hold 8-1/2 x 11-inch paper; with clear plastic sleeve on spine to hold label describing contents and with pockets inside covers to hold folded oversize sheets.

      1) If two or more binders are necessary to accommodate data of a system, organize data in each binder into groupings by subsystem and related components. Cross-reference other binders if necessary to provide essential information for proper operation or maintenance of equipment or system.
      2) Identify each binder on front and spine, with printed title “OPERATION AND MAINTNANCE MANUAL,” Project title or name, project number and subject matter contents. Indicate volume number for multiple-volume sets and six-digit Section number on bottom of spine.

   b. Dividers: Heavy-paper dividers with plastic-covered tabs for each section. Mark each tab to indicate contents. Include typed list of products and major components of equipment included in the system on each divider, cross-referenced to Specification Section number and title of Project Manual.
   c. Protective Plastic Sleeves: Transparent plastic sleeves designed to enclose diagnostic software diskettes for computerized electronic equipment.
   d. Supplementary Text: Prepared on 8-1/2 x 11-inch, 20-lb/sq.ft. white bond paper.

e. Drawings: Attached reinforced, punched binder tabs on drawings and bind with text.

1) If oversize drawings are necessary, fold drawings to same size as text pages and use as foldouts.
2) If drawings are too large to be used as foldouts, fold and place drawings in labeled envelopes and bind envelopes in rear of manual or reduced drawings. DO NOT USE BINDER POCKETS. At appropriate locations in manual, insert typewritten pages indicating drawing titles, descriptions of contents and drawing locations.

f. Provide color photographs instead of drawings where necessary to demonstrate unusual or complex installations.

7. Emergency Information:

a. Information for technical and nontechnical personnel about actions recommended during emergency situations to protect life and property and to minimize disruption to the building occupants. Emergencies shall, at a minimum, include:

1) Fire.
2) Security breach.
3) Water outage.
4) Power failure.
5) Refrigerant release.
6) Heating failure.
7) Cooling failure.

3.13 EMERGENCY MANUALS

A. Content: Organize manual into a separate section for each of the following:

1. Type of emergency
2. Emergency instructions
3. Emergency procedures

B. Type of Emergency: Where applicable for each type of emergency indicated below, include instructions and procedures for each system, subsystem, piece of equipment and component:

1. Fire
2. Flood
3. Gas leak
4. Water leak
5. Power failure
6. Water outage
7. System, subsystem or equipment failure
8. Chemical release or spill
9. Sub-freezing weather conditions

C. Emergency Instructions: Describe and explain warnings, trouble indications, error messages and similar codes and signals. Include responsibilities of Using Agency's operating personnel for notification of Installer, supplier and manufacturer to maintain warranties.

D. Emergency Procedures: Include the following as applicable:

1. Instructions on stopping
2. Shutdown instructions for each type of emergency
3. Operating instructions for conditions outside normal operating limits
4. Required sequences for electric or electronic systems
5. Special operating instructions and procedures

3.14 OPERATION MANUALS

A. Content: In addition to requirements in this Section, include operation data required in individual Specification Sections and the following information:

1. System, subsystem and equipment descriptions
2. Performance and design criteria if Contractor is delegated design responsibility
3. Operating standards
4. Operating procedures
5. Operating logs
6. Wiring diagrams
7. Control diagrams
8. Piped system diagrams
9. Valve tag lists
10. Precautions against improper use
11. License requirements including inspection and renewal dates

B. Descriptions: Include the following:

1. Product name and model number
2. Manufacturer's name
3. Equipment identification with serial number of each component
4. Equipment function
5. Operating characteristics
6. Limiting conditions
7. Performance curves for pumps, fans and heat exchangers
8. Engineering data and tests
9. Complete nomenclature and number of replacement parts

C. Operating Procedures: Include the following, as applicable:

1. Startup procedures
2. Equipment of system break-in procedures
3. Routine and normal operating instructions
4. Regulation and control procedures
5. Instructions on stopping
6. Normal shutdown instructions
7. Seasonal and weekend operating instructions
8. Required sequences for electric or electronic systems
9. Special operating instructions and procedures

D. Systems and Equipment Controls: Describe the sequence of operation and diagram controls as installed.

E. Piped Systems: Diagram piping as installed and identify color-coding where required for identification.

3.15 PRODUCT MAINTENANCE MANUAL

A. Content: Organize manual into a separate section for each product, material and finish. Include source information, product information, maintenance procedures, repair materials, warranty information and bond information as described below.

B. Source Information: List each product included in manual, identified by product name and arranged to match manual's table of contents. For each product, list name, address and telephone number of Installer or supplier and maintenance service agent. Cross-reference Specification Section number and title in Project Manual.

C. Product Information: Include the following as applicable:

1. Product name and model number
2. Manufacturer's name
3. Color, pattern and texture
4. Material and chemical composition
5. Reordering information for specialty manufactured products

D. Maintenance Procedures: Include manufacturer's written recommendations and the following:

1. Inspection procedures
2. Types of cleaning agents to be used and methods of cleaning
3. List of cleaning agents and methods of cleaning detrimental to product
4. Schedule of routine cleaning and maintenance
5. Repair instructions

E. Repair Materials and Sources: Include list of materials and local sources of materials and related services.

F. Warranties and Bonds: Include copies of executed warranties and bonds and lists of circumstances and conditions that would effect validity of warranties and bonds.

1. Include procedures to follow and required notifications for warranty claims.

3.16 SYSTEMS AND EQUIPMENT MAINTENANCE MANUAL

A. Content: For each system, subsystem and piece of equipment not part of a system, include source information, product information, maintenance procedures, repair materials, warranty information and bond information as described below.

B. Source Information: List each product included in manual, identified by product name and arranged to match manual's table of contents. For each product, list name, address and telephone number of Installer or supplier and maintenance service agent. Cross-reference Specification Section number and title in Project Manual.

C. Manufacturer's Maintenance Documentation: Manufacturer's maintenance documentation including the following information for each component part or piece of equipment:

1. Standard printed maintenance instructions and bulletins
2. Drawings, diagrams and instructions required for maintenance including disassembly and component removal, replacement and assembly.

3. Identification and nomenclature of parts and components
4. List of items recommended to be stocked as spare parts

D. Maintenance Procedures: Include the following information and items that detail essential maintenance procedures:

1. Test and inspection instructions
2. Troubleshooting guide
3. Precautions against improper maintenance
4. Disassembly: component removal, repair and replacement and reassembly Instructions
5. Aligning, adjusting and checking instructions
6. Manufacturer's demonstration and training videotape or DVD, if available.

E. Maintenance and Service Schedule: Include service and lubrication requirements, list of required lubricants for equipment and separate schedules for preventative and routine maintenance and service with standard time allotment.

1. Scheduled Maintenance and Service: Tabulate actions for daily, weekly, monthly, quarterly, semiannual and annual frequencies
2. Maintenance and Service Record: Include manufacturer's forms for recording maintenance.

F. Spare Parts List and Source Information: Include lists of replacement and repair parts, with parts identified and cross-referenced to manufacturer's maintenance documentation and local sources of maintenance materials and related services.

G. Maintenance Service Contracts: Include copies of maintenance agreements with name and telephone number of service agent.

H. Warranties and Bonds: Include copies of executed warranties and bonds and lists of circumstances and conditions that would effect validity of warranties and bonds.

1. Include procedures to follow and required notifications for warranty claims.

NOTE: Where manuals contain manufacturer's standard printed data, include only sheets pertinent to product or component installed. Mark each sheet to identify each product or component incorporated into the Work. If data includes more than one item in a tabular format, identify each item using appropriate references from the Contract Documents. Identify data applicable to the Work and delete references to information not applicable.

3.17 TEST REPORTS AND CERTIFICATIONS

A. Provide copies of tests and certifications performed during manufacture and construction, including but not limited to the following:

1. Results of variable frequency drive burn-in tests.
2. Certification of installation of vibration isolation.
3. Receipt for spare fuses.
4. Receipt for instruction of operating personnel.
5. Certification of installation of underground steam system.
6. Certification of installation of underground chilled water system.
7. Certification of hydronic and steam system cleaning.
8. Certification of chiller installation and safety and control check-out.
9. Receipt for extra mechanical seals for pumps.
10. Certification of alignment of pumps.

11. Certification of EMCS system calibration and testing.
12. Receipt for EMCS system training.
13. Receipt acknowledging no EMCS system failures during test period.
14. Certification of ductwork testing results.
15. Seasonal adjustment reports.
16. Warranty certificates
17. Inspection certificates
18. Test, adjust and balance report
19. Commissioning report

3.18 DIAGRAMS

A. Frame and mount the following information:

Information	Location
HVAC diagrams, start-stop procedures, and valve schedules.	Appropriate mechanical rooms.
Energy Management control diagrams and sequences.	Adjacent to each control panel.
Appropriate control and interface drawings, including a simplified guide to local programming through the digital display unit, a directory of I/O points connected to that panel, and variables which may be displayed.	Posted on the inside cover of each EMCS panel.

B. Diagrams shall be computer generated.

C. Diagrams shall be as-built, and shall include interfaces and interlocks with other equipment.

D. Diagram framing system: 0.125" thick acrylic with satin finish aluminum frames.

3.19 MAINTENANCE

A. Equipment operated prior to the date of substantial completion shall be maintained in accordance with manufacturer's recommendations. In addition, provide complete water treatment for hydronic and steam systems operated prior to date of substantial completion.

B. Prepare and submit a lubrication chart listing for each piece of equipment:

1. Points requiring lubrication.
2. Recommendations for a single manufacturer's lubricants with brand name and designation.
3. Frequency of lubrication required.

C. Lubricate each item of apparatus requiring lubrication prior to start-up in accordance with the manufacturer's recommendations.

3.20 DEMONSTRATION AND TRAINING FOR MECHANCIAL SYSTEMS AND EQUIPMENT

A. Submittals

1. Instruction Program: Submit to the Professional copies of instructional program outline for demonstration and training, including a schedule of proposed dates, times, length of instruction and instructors' names for each training module. Include learning objective and outline for each training.

    a. At completion of training, submit two (2) complete training manuals for Using Agency's use.

2. Qualification Data: Include lists of completed projects with project names and addresses, names and addresses of Professionals and Using Agency and other information specified.
3. Attendance Record: For each training module, submit list of participants and length of instruction time.
4. Evaluations: For each participant and each training module, submit results and documentation of performance-based test.
5. Demonstration and Training DVD's: Submit two copies of each DVD within seven (7) days of recording.

    a. Format: Provide high quality color DVDs
    b. Identification: On each DVD, provide an applied label with the following information:

        1) Name of project
        2) Name and address of photographer
        3) Name of Engineer
        4) Name of Contractor
        5) Date DVD was recorded
        6) Description of vantage point, indicating location, direction (by compass point) and elevation or construction story

    c. Transcript: Prepared on 8-1/2 x 11" (A4) paper, punched and bound in heavy-duty, 3-ring, vinyl-covered binders. Mark appropriate identification on front and spine of each binder. Include a cover sheet with the same label information as the corresponding DVD. Include name of Project and date of DVD on each page.

B. Quality Assurance

1. Instructor Qualifications: A factory-authorized service representative experienced in operation and maintenance procedures and training.
2. Photographer Qualifications: An individual of established reputation who has been regularly engaged as a professional video photographer for not less than five years.
3. Pre-instruction Conference: Review methods and procedures related to demonstration and training including, but not limited to the following:

    a. Inspect and discuss locations and other facilities required for instruction.
    b. Review and finalize instruction schedule and verify availability of educational materials, instructors' personnel, audiovisual equipment and facilities needed to avoid delays.
    c. Review required content of instruction.
    d. For instruction that must occur outside, review weather and forecasted weather conditions and procedures to follow if conditions are unfavorable.

C. Coordination

1. Coordinate instruction schedule with Using Agency's operations. Adjust schedule as required to minimize disrupting Using Agency's operations.

2. Coordinate instructors, including providing notification of dates, times, length of instruction and course content.
3. Coordinate content of training modules with content of approved emergency, operation and maintenance manuals. Do not submit instruction program until operation and maintenance data has been reviewed and approved by Professional.

D. Instruction Program

1. Program Structure: Develop an instruction program that includes individual training modules for each system and equipment not part of a system, as required by individual Specification Sections and as follows:

    a. Heat generation including boiler, pumps and heating water distribution piping.
    b. Gas-fired heating equipment.
    c. Refrigeration system including chillers, pumps, ice storage tanks and chilled water piping.
    d. HVAC system including air-handling equipment, unit heaters, power ventilators, heat exchangers, piping specialties, etc.
    e. Building Automation System
    f. All control end-devices and sensors
    g. Variable Frequency Drives

2. Training Modules (Basis of System Design, Operational Requirements and Criteria): Develop a learning objective and teaching outline for each module. Include a description of specific skills and knowledge that participants are expected to master. For each module, include instruction for the following (this will be provided through the Professional):

    a. System, subsystem and equipment descriptions
    b. Performance and design criteria
    c. Operating standards
    d. Regulatory requirements
    e. Equipment function
    f. Operating characteristics
    g. Limiting conditions
    h. Performance curves

3. Training Modules (Documentation): Review the following items in detail:

    a. Emergency manuals
    b. Operations manuals
    c. Maintenance manuals
    d. Project record documents
    e. Submittal manual
    f. Identification systems
    g. Warranties and bonds
    h. Maintenance service agreements and similar continuing commitments

4. Emergencies: Include the following as applicable:

    a. Instructions on meaning of warnings, trouble indications and error messages
    b. Instructions on stopping
    c. Shutdown instructions for each type of emergency
    d. Operating instructions for conditions outside of normal operating limits
    e. Sequences for electric or electronic systems
    f. Special operating instructions and procedures

5. Operations: Include the following as applicable:

    a. Startup procedures
    b. Equipment or system break-in procedures
    c. Routine and normal operating instructions
    d. Regulation and control procedures
    e. Control Sequences
    f. Safety procedures
    g. Instructions on stopping
    h. Normal shutdown instructions
    i. Operating procedures for emergencies
    j. Operating procedures for system, subsystem or equipment failure
    k. Seasonal and weekend operating instructions
    l. Required sequences for electric or electronic systems
    m. Special operating instructions and procedures

6. Adjustments: Include the following:

    a. Alignments
    b. Checking adjustments
    c. Noise and vibration adjustments
    d. Economy and efficiency adjustments

7. Troubleshooting: Include the following:

    a. Diagnostic instructions
    b. Test and inspection procedures

8. Maintenance: Include the following:

    a. Inspection procedures
    b. Types of cleaning agents to be used and methods of cleaning
    c. List of cleaning agents and methods of cleaning detrimental to product
    d. Procedures for routine cleaning
    e. Procedures for preventative maintenance
    f. Procedures for routine maintenance
    g. Instructions on use of special tools

9. Repairs: Include the following:

    a. Diagnosis instructions
    b. Repair instructions
    c. Disassembly: component removal, repair and replacement and reassembly instructions
    d. Instructions for identifying parts and components
    e. Review of spare parts needed for operation and maintenance

E. Instruction

1. Facilitator: The Professional will serve as facilitator to assist the Contractor in preparation of instruction program and training modules, to coordinate instructors and to coordinate between Contractor and Using Agency for number of participants, instruction times and location.

2. Engage qualified instructors to instruct Using Agency's personnel to adjust, operate and

maintain systems, subsystems and equipment not part of a system.

a. Professional will furnish an instructor to describe basis of system design, operational requirements, criteria and regulatory requirements.
b. Using Agency will furnish an instructor to describe Using Agency's operational philosophy.
c. Using Agency will furnish Contractor with names and positions of participants.

3. Scheduling: Provide instruction at mutually agreed on times. For equipment that requires seasonal operation, provide similar instruction at start of each season.

a. Schedule training with Using Agency, through Professional, with at least forty-five (45) days advance notice.

4. Evaluation: At conclusion of each training module, assess and document each participant's mastery of module by use of a written performance-based test.

5. Demonstration and Training DVD: Record each training module separately. Include classroom instructions and demonstrations, board diagrams and other visual aids, but not student practice.

a. At beginning of each training module, record each chart containing learning objective and lesson outline.

6. Cleanup: Collect used and leftover educational materials and give to Using Agency. Remove instructional equipment. Restore systems and equipment to condition existing before initial training use.

F. Demonstration and Training DVDs

1. Demonstration and Training DVDs: Record instruction of Using Agency's personnel in the operation and maintenance of equipment and systems. Edit DVDs to remove non-instructional conversation. Photographer shall select vantage points to best show equipment, systems and procedures demonstrated.

END OF SECTION 23 00 10

SECTION 23 05 00 BASIC MECHANICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These mechanical provisions specified herein apply to all Sections of Division 22 and Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. This Section includes the following basic mechanical materials and methods to complement other Division 23.

1. Temporary operation of mechanical equipment
2. Piping materials and installation instructions common to most piping systems
3. Concrete base construction requirements
4. Sleeves
5. Escutcheons
6. Dielectric fittings
7. Flexible connectors
8. Mechanical sleeve seals
9. Wall and ceiling access panels
10. Nonshrink grout for equipment installations
11. Field-fabricated metal equipment supports
12. Prefabricated roof curbs and equipment supports
13. Installation requirements common to equipment specification sections
14. Cutting and drilling
15. Touchup painting and finishing

B. Pipe and pipe fitting materials are specified in Division 23 piping system Sections.

1.3 DEFINITIONS

A. Refer to Section 23 00 10 – Mechanical General Provisions

B. The following are industry abbreviations for plastic materials:

1. PE: Polyethylene plastic
2. PVC: Polyvinyl chloride plastic

C. The following are industry abbreviations for rubber materials:

1. EPDM: Ethylene-propylene-diene terpolymer rubber

1.4 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Sleeves	R			
Escutcheons	R			
Dielectric fitting	R			
Flexible connectors	R			R
Mechanical sleeve seals	R	R		R
Access panels	R			R
Prefabricated roof curbs and equipment supports	R			R

1.5 QUALITY ASSURANCE

A. Equipment Selection: Equipment of higher electrical characteristics, physical dimensions, capacities, and ratings may be furnished provided such proposed equipment is approved in writing and connecting mechanical and electrical services, circuit breakers, conduit, motors, bases, and equipment spaces are increased. Additional costs shall be paid by this Contractor for these increases. If minimum energy ratings or efficiencies of equipment are specified, equipment must meet design and commissioning requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and prevent entrance of dirt, debris, and moisture.

B. Protect stored pipes and tubes from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor, if stored inside.

C. Protect flanges, fittings, and piping specialties from moisture and dirt. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.7 SEQUENCING AND SCHEDULING

A. Coordinate mechanical equipment installation with other building components.

B. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction to allow for mechanical installations.

C. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components, as they are constructed.

D. Sequence, coordinate, and integrate installations of mechanical materials and equipment for efficient flow of the Work. Coordinate installation of large equipment requiring positioning before closing in building.

E. Coordinate connection of mechanical systems with exterior underground and overhead utilities and services. Comply with requirements of governing regulations, franchised service companies, and controlling agencies.

F. Coordinate requirements for access panels and doors if mechanical items requiring access are concealed behind finished surfaces.

G. Coordinate installation of identifying devices after completing covering and painting, if devices are applied to surfaces. Install identifying devices before installing acoustical ceilings and similar concealment.

1.8 TEMPORARY OPERATION OF MECHANICAL EQUIPMENT

A. The Contractor shall notify the Professional in writing fourteen (14) days in advance to request temporary operation of the building HVAC systems.

B. The Professional will schedule a site-visit to observe the site conditions to ensure all the items described below have been met prior to temporary operation.

C. The Contractor shall submit in writing an operation and maintenance plan for temporary use of the building HVAC systems. At a minimum the O&M plan shall address:

1. Equipment, system, and filter maintenance
2. Temporary filter installation locations
3. Daily, weekly, monthly, etc. cleaning procedures to ensure indoor cleanliness.
4. Describe in detail how the system will be controlled and indoor conditions monitored. Procedures for shutting down equipment or isolation of areas where dust, dirt, or particulate producing activities occur.

D. At a minimum the following building components and activities shall be completed prior to operation of the building HVAC systems

1. Dust or particulate generating construction activities completed.
2. All dirt, dust, and debris have been removed from the Mechanical Room.
3. Piping insulation is fully completed and all seams, openings, etc. have been sealed.
4. All HVAC system equipment utilized for temporary heating and cooling shall have been started up per specifications. All startup and warranty information (including checklists) shall be completed and submitted to the Professional.
5. All temporary air filters in place of types and installed in locations specified in 23 40 00 Air Cleaning Devices. All return air distribution devices and openings shall be covered and protected with filter material specified in 23 40 00 Air Cleaning Devices. All temporary filters shall be continually monitored and replaced periodically when required.

E. Upon completion of the Professional's site visit, review of site conditions and temporary operation plan, the Professional reserves the right to refuse temporary startup and operation if site conditions and plan do not meet specifications. No additional time will be given to the Contractor due to unapproved startup and temporary operation conditions.

F. The building indoor environmental conditions shall be continuously maintained within the following limits:

1. Maximum indoor temperature: 85 ˚F dry bulb
2. Minimum indoor temperature: 60 ˚F dry bulb
3. Maximum indoor relative humidity: 80% RH

G. Temperature and humidity dataloggers shall be installed throughout the facility to record indoor condition data. Datalogger quantity and locations shall be approved by Professional. Data from dataloggers shall be submitted to the Professional every two weeks for review. Data shall be submitted in .csv format or other format agreed upon by Professional.

H. Contractor shall have either spedified or temporary controls in place and fully operational to maintain the specified indoor environmental conditions above. Contractor shall provide all required temporary building services for temporary operation at no additional cost to the Using Agency.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Dielectric Flanges:

   a. Capitol Manufacturing Co.
   b. Central Plastics Co.
   c. Epco Sales Inc.
   d. Watts Industries, Inc.; Water Products Div.

2. Dielectric-Flange Insulating Kits:

   a. Calpico, Inc.
   b. Central Plastics Co.
   c. Or equal

3. Dielectric Couplings:

   a. Calpico, Inc.
   b. Or equal

4. Dielectric Nipples:

   a. Grinnell Corp.; Grinnell Supply Sales Co.
   b. Perfection Corp.

c. Victaulic Co. of America

5. Mechanical Sleeve Seals:

a. Calpico, Inc.
b. Metraflex Co.
c. Thunderline/Link-Seal

6. Access Panels:

a. Williams Brothers
b. Acudor
c. J.R. Smith
d. Or Equal

7. Prefabricated Roof Curbs and Equipment Supports:

a. Custom Curb, Inc.
b. Thybar
c. Or Equal

2.2 PIPE AND PIPE FITTINGS

A. Refer to individual Division 23 piping Sections for pipe and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Refer to individual Division 23 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness, unless thickness or specific material is indicated.

a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

E. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

F. Solder Filler Metals: ASTM B 32.

1. Alloy Sn95 or Alloy Sn94: Approximately 95 percent tin and 5 percent silver, with 0.10 percent lead content.
2. Alloy E: Approximately 95 percent tin and 5 percent copper, with 0.10 percent maximum lead content.
3. Alloy HA: Tin-antimony-silver-copper zinc, with 0.10 percent maximum lead content.
4. Alloy HB: Tin-antimony-silver-copper nickel, with 0.10 percent maximum lead content.

G. Brazing Filler Metals: AWS A5.8.

1. BCuP Series: Copper-phosphorus alloys.
2. BAg1: Silver alloy.

H. Solvent Cements

1. PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.

I. Plastic Pipe Seals: ASTM F 477, elastomeric gasket

J. Flanged, Ductile-Iron Pipe Gasket, Bolts, and Nuts: AWWA C110, rubber gasket, carbon-steel bolts and nuts.

K. Couplings: Iron-body sleeve assembly, fabricated to match OD of plain-end, pressure pipes.

1. Sleeve: ASTM A 126, Class B, gray iron.
2. Followers: ASTM A 47 (ASTM A 47M) malleable iron or ASTM A 536 ductile iron.
3. Gaskets: Rubber.
4. Bolts and Nuts: AWWA C111.
5. Finish: Enamel paint.

2.4 DIELECTRIC FITTINGS

A. General: Assembly or fitting with insulating material isolating joined dissimilar metals, to prevent galvanic action and stop corrosion.

B. Description: Combination of copper alloy and ferrous; threaded, solder, plain, and weld-neck end types and matching piping system materials.

C. Insulating Material: Suitable for system fluid, pressure, and temperature.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.

E. Dielectric-Flange Insulation Kits: Field-assembled, companion-flange assembly, full-face or ring type. Components include neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.

1. Provide separate companion flanges and steel bolts and nuts for 150- or 300-psig minmum working pressure as required to suit system pressures.

F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 °F.

G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain or threaded ends; and 300-psig minimum working pressure at 225 °F.

2.5 FLEXIBLE CONNECTORS

A. General: Fabricated from materials suitable for system fluid and that will provide flexible pipe connections. Include 125-psig minimum working-pressure rating, unless higher working pressure is indicated, and ends according to the following:

B. Bronze-Hose, Flexible Connectors: Corrugated, bronze, inner tubing covered with bronze wire braid. Include copper-tube ends or bronze flanged ends, braze welded to hose.

C. Stainless-Steel-Hose/Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Include steel nipples or flanges, welded to hose.

D. Rubber, Flexible Connectors: CR or EPDM elastomer rubber construction, with multiple plies of NP fabric, molded and cured in hydraulic presses. Include 125-psig minimum working-pressure rating at 220 °F. Units may be straight or elbow type, unless otherwise indicated.

2.6 MECHANICAL SLEEVE SEALS

A. Description: Modular design, with interlocking rubber links shaped to continuously fill annular space between pipe and sleeve. Include connecting bolts and pressure plates.

1. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
2. Pressure Plates: Stainless steel. Include two for each sealing element.
3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.7 PIPING SPECIALTIES

A. Sleeves: Sleeves shall be standard weight steel pipe except sleeves for concealed piping through floors not in structural members, and through interior drywall construction may be formed from 24 gauge galvanized sheet metal lapped and pop riveted.

1. Sleeves through grade slabs, basement or exterior wall shall be steel or cast iron pipe with water stop flange, set flush with finished surfaces and an expansion seal (see Mechanical Sleeve Seal herein.)
2. Sleeves in wet or potentially wet floors, exterior walls or spaces such as mechanical equipment rooms or sprinklered areas other than those requiring fire stopping, shall be Schedule 40 galvanized steel pipe with water stop flange and with the top of the sleeve projecting 2-inches above the finished floor or beyond the inside wall surface and expansion seal installed.

B. Escutcheons: Manufactured wall, ceiling, and floor plates; deep-pattern type if required to conceal protruding fittings and sleeves.

1. ID: Closely fit around pipe, tube, and insulation of insulated piping
2. Completely cover opening
3. Cast Brass: One piece, with set screw.

    a. Finish: Polished chrome-plate.

4. Cast Brass: Split casting, with concealed hinge and set screw.

    a. Finish: Polished chrome-plate.

5. Cast-Iron Floor Plate: One-piece casting.

2.8 GROUT

A. Nonshrink, Nonmetallic Grout: ASTM C 1107, Grade B

1. Characteristics: Post-hardening, volume-adjusting, dry, hydraulic-cement grout, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
2. Design Mix: 5000-psig, 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

2.9 ACCESS PANELS

A. Access panels shall be provided for all concealed valves, controls, dampers, and other mechanical equipment and devices where occasional access for adjustment or repairs will be necessary. Panels shall have cam and cylinder lock with two keys. All locks shall be keyed alike. Label panels as in accordance with Section 23 05 53 – Mechanical System Identification.

B. Size of panels to be large enough to permit servicing or replacement of devices, controls, valves, etc.; minimum size to be 18"x18". Submit schedule with submittal package indicating location and size.

C. General:

1. Fabricate units of all welded steel construction.
2. The frame and panel assembly for fire rated access panels shall be manufactured under the Factory Inspection Service of Underwriters Laboratories, Inc., and shall bear a label reading: "Frame and Fire Door Assembly, Rating 1-1/2 Hr. (B), Temperature Rise 30 Minutes, 250ºF, Maximum".
3. Access panels used in toilets, kitchens, and other areas expected to experience high relative humidity are to be constructed of stainless steel.

D. Flush Panel Access Panels: Model WB-GP.

1. Frame and door shall be of one piece unit body construction and 14 gauge steel. Body shall be 18 gauge steel with a return edge around door opening.
2. Flange shall be 1-3/4” wide.
3. Hinges shall be concealed, piano type, opening to 175 degrees. Number of hinges will vary with size of door.

4. Locks shall be flush, key operated cylinder lock. Number of locks will vary with size of door.
5. Finishes shall be factory applied with a rust inhibiting phosphated undercoat; finish to be chemically bonded oven baked white enamel.
6. For installation in masonry openings, units shall be furnished with flexible metal anchor straps welded to the body.

E. Flush Access Panel for Drywall or Plaster: Model WB-DW and WB-PL:

1. Body and flange shall be 16 gauge steel. Door shall be 14 gauge steel.
2. Hinges shall be concealed, piano type, opening to 175 degrees. Number of hinges will vary with size of door.
3. Locks shall be flush, key operated cylinder lock. Number of locks will vary with size of door.
4. Finish shall be factory applied oven baked grey enamel with rust inhibiting phosphated undercoat.
5. Plaster models shall have 2-1/2” of 24 gauge galvanized expanded wing casting surrounding door.
6. Drywall models shall have a 1-1/8” perforated drywall bead on all four sides.

F. Fire Rated “B” Label Access Panel: Model WB-FR

1. Frame and door shall be of one piece unit body construction and 14 gauge steel. Door shall be sandwich type filled with 2" thick thermafiber felt insulation and back enclosure of 22 gauge steel. Body shall be 16 gauge steel.
2. Flange shall be 1-3/4” wide.
3. Hinge shall be continuous steel piano type mounted on long side of doors, opening to 180 degrees and equipped with a spring mechanism for automatic closure.
4. Lock assembly shall be self-latching with key operated cylinder lock and shall have a mechanism to release the latch bolt from the inside.
5. Finish shall be factory applied oven baked grey enamel with rust inhibiting phosphated undercoat.
6. For installation in masonry openings, units may be furnished with flexible metal anchor straps welded to the body.

2.10 PREFABRICATED ROOF CURBS AND EQUIPMENT SUPPORTS

A. Contractor shall provide all curbs, adaptor curbs and supports required for pipe penetrations of roof and equipment installation; the General Contractor shall install and flash.

B. Roof curbs and equipment supports shall be constructed as required such that the top is level and plumb.

C. Prefabricated curbs and equipment supports shall be Custom Curb, Inc., Thybar or equal as follows (Exception: packaged rooftop unit and power ventilator curbs are provided with equipment):

1. Equipment Supports

a. CES-1 or CES-2 Series: Check roof construction before ordering.

2. Pipe Penetrations

a. CPBA-1 or CPBA-2 Series: Check roof construction before ordering.

3. Equipment Platforms

a. CPF-1 or CPF-2 Series: Check roof construction before ordering.

D. Standard Construction - CES Series: Minimum of 18 gauge galvanized steel construction, fully mitered, welded corners, 3 inch cant, internal bulkhead reinforcing, 2x4 wood nailer and 18 gauge counter flashing. Equipment supports shall span a minimum of two joists. No load shall be applied to a cantilever section exceeding 1'-0" in length.

E. All curbs, pipe supports, etc. shall be a minimum of 14" high.

F. All exposed roof curbs, equipment supports, and flashing shall be factory or field painted to match roof color. Coordinate color with Professional.

G. Installation shall be in strict accordance with manufacturer's printed instructions and as detailed on drawings. Curb manufacturer shall coordinate fabrication with Mechanical and General Contractors.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. General: Install piping as described below, unless piping Sections specify otherwise. Individual Division 23 piping Sections specify unique piping installation requirements.

B. General Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated, unless deviations to layout are approved on Coordination Drawings.

C. Install piping at indicated slope.

D. Install components with pressure rating equal to or greater than system operating pressure.

E. Install piping in concealed interior and exterior locations, except in equipment rooms and service areas.

F. Install piping free of sags and bends.

G. Install exposed interior and exterior piping at right angles or parallel to building walls. Diagonal runs are prohibited, unless otherwise indicated.

H. Install piping tight to slabs, beams, joists, columns, walls, and other building elements. Allow sufficient space above removable ceiling panels to allow for ceiling panel removal.

I. Install piping to allow application of insulation plus 1-inch clearance around insulation.

J. Locate groups of pipes parallel to each other, spaced to permit valve servicing.

K. Install fittings for changes in direction and branch connections.

L. Install couplings according to manufacturer's written instructions.

M. Verify final equipment locations for roughing-in.

N. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

O. Install sleeves for pipes passing through concrete and masonry walls, and concrete floor and roof decks.

1. Cut sleeves to length for mounting flush with both surfaces.

    a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.

2. Build sleeves into new walls and slabs as work progresses.
3. Install sleeves large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:

    a. Steel Pipe Sleeves: For pipes smaller than 6”. Steel, Sheet-Metal Sleeves: For pipes 6” and larger, penetrating gypsum-board partitions.

4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using elastomeric joint sealants. Refer to Division 7 Section "Sealants" for materials.
5. Use Type S, Grade NS, Class 25, Use O, neutral-curing silicone sealant, unless otherwise indicated.

P. Aboveground, Exterior-Wall, Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Size sleeve for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Install steel pipe for sleeves smaller than 6 inches in diameter.
2. Install cast-iron "wall pipes" for sleeves 6 inches in diameter and larger.
3. Assemble and install mechanical sleeve seals according to manufacturer's written instructions. Tighten bolts that cause rubber sealing elements to expand and make watertight seal.

Q. Underground, Exterior-Wall, Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Size sleeve for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Assemble and install mechanical sleeve seals according to manufacturer's written instructions. Tighten bolts that cause rubber sealing elements to expand and make watertight seal.

R. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestopping materials. Refer to Division 7 Section "Firestopping” for materials.

S. Verify final equipment locations for roughing-in.

T. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

U. Install pipe escutcheons for pipe penetrations of concrete and masonry walls, wall board partitions, and suspended ceilings according to the following:

1. Uninsulated Piping Wall Escutcheons: Cast brass, chrome plated, with set screw.
2. Uninsulated Piping Floor Plates in Utility Areas: Cast-iron floor plates.
3. Insulated Piping: Cast brass; with concealed hinge, spring clips, and chrome-plated finish.
4. Piping in Utility Areas: Cast brass, with set-screw or spring clips.

V. Piping Joint Construction: Join pipe and fittings as follows and as specifically required in individual piping specification Sections:

1. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
2. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
3. Soldered Joints: Construct joints according to AWS's "Soldering Manual," Chapter "The Soldering of Pipe and Tube."
   Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube."
4. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

   a. Note internal length of threads in fittings or valve ends, and proximity of internal seat or wall, to determine how far pipe should be threaded into joint.
   b. Apply appropriate tape or thread compound to external pipe threads, unless dry seal threading is specified.
   c. Align threads at point of assembly.
   d. Tighten joint with wrench. Apply wrench to valve end into which pipe is being threaded.
   e. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

5. Welded Joints: Construct joints according to AWS D10.12, "Recommended Practices and Procedures for Welding Low Carbon Steel Pipe," using qualified processes and welding operators according to "Quality Assurance" Article. Clean welds and paint with oil-based primer.
6. Flanged Joints: Align flange surfaces parallel. Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly using torque wrench.
7. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join pipe and fittings according to the following:

a. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
b. PVC Nonpressure Piping: ASTM D2855.

W. Piping Connections: Make connections according to the following, unless otherwise indicated:

1. Install unions, in piping 2-inch and smaller, adjacent to each valve and at final connection to each piece of equipment with 2-inch or smaller threaded pipe connection.
2. Install flanges, in piping 2-1/2-inch and larger, adjacent to flanged valves and at final connection to each piece of equipment with flanged pipe connection.
3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
4. Wet Piping Systems: Install dielectric coupling, unions, and nipple fittings to connect piping materials of dissimilar metals.

3.2 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to provide maximum possible headroom, if mounting heights are not indicated.

B. Install equipment according to approved submittal data. Portions of the Work are shown only in diagrammatic form. Refer conflicts to Professional.

C. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

D. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

E. Install equipment giving right of way to piping installed at required slope.

F. Install flexible connectors on equipment side of shutoff valves, horizontally and parallel to equipment shafts if possible.

3.3 CONCRETE BASES

A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer’s written instructions and according to seismic codes at Project.

1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit. Edges to be chamfered.
2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.
3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
5. Install anchor bolts to elevations required for proper attachment to supported equipment.
6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

7. Use 3000-psi, 28-day compressive-strength concrete and reinforcement as specified in Division 3 Section Cast-in-Place Concrete.

3.4 ERECTION OF METAL SUPPORTS AND ANCHORAGE

A. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

B. Field Welding: Comply with AWS D1.1, "Structural Welding Code--Steel."

3.5 CUTTING AND DRILLING

A. Cut, channel, chase, and drill floors, walls, partitions, ceilings, and other surfaces necessary for mechanical installations. Perform cutting by skilled mechanics of trades involved.

B. All fire-rated walls, floors, partitions, ceiling and other surface penetrations shall be fire-stopped per Fire-Stopping specifications.

3.6 GROUTING

A. Install nonmetallic, nonshrink, grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors. Mix grout according to manufacturer's written instructions.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placing of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases to provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout according to manufacturer's written instructions.

END OF SECTION 23 05 00

SECTION 23 05 13 - MOTORS AND CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Motors
2. Variable speed drives
3. Motor controllers where provided as part of mechanical equipment

B. Related Sections

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 00 50 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. ABMA 9 – Load Ratings and Fatigue Life for Ball Bearings

B. ABMA 11 – Load Ratings and Fatigue Life for Roller Bearings

C. ANSI/IEEE 112 – Test Procedure for Polyphase Induction Motors and Generators

D. ANSI/NEMA MG 1 – Motors and Generators

E. ANSI/NFPA 70 – National Electrical Code

F. IEEE – Standard 519-1992, IEEE Guide for Harmonic Content and Control

G. NEMA – ICS 7.0, AC Adjustable Speed Drives

H. Underwriters laboratories – UL508C

1.4 DEFINITIONS

A. VSD: Variable speed drive

B. ECM: Electrically Commutated Motor

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Motors	R	R		R
Belts and Drives		R		
Variable Speed Drives	R	R		R
Motor Controllers/Starters	R	R		R

C. Submittals shall include certification from the motor manufacturer certifying compliance with NEMA MG-1, part 31 for motors that are driven by variable speed drives.

D. Submit a site specific harmonic analysis showing total voltage harmonic distortion and total current harmonic distortion is in compliance with IEEE 519. If the analysis indicates that additional external devices or filters are required to meet the power quality requirements of the VSD, provide the devices or filters at no additional cost to the Using Agency. See Paragraph 2.3B.2.

1.6 WARRANTY

A. Special Warranty: VSD warranty shall be 24 months from date of start-up certification including all parts, labor, travel time, and expenses.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Motors

1. MagnaTek
2. Century Electric Co.
3. General Electric
4. Lincoln Electric Co.
5. Gould Inc.
6. Baldor

B. Variable speed drives

1. Yaskawa
2. Trane

3. ABB
4. Danfoss

C. Motor controllers/starters

1. ABB
2. Allen-Bradley
3. Cerus
4. Crouse-Hinds
5. Cutler-Hammer
6. GE
7. Square D
8. Siemens

2.2 MOTORS

A. General

1. In accordance with NEMA, IEEE, and ANSI C50 standards
2. Capacity
    a. Minimum horsepower indicated
    b. To operate driven devices under all conditions without overload
3. Squirrel-cage induction type, NEMA Type "B: insulation class, continuous duty
4. Speed
    a. 1750 RPM, unless otherwise indicated
    b. See schedules on drawings for other speeds
5. NEMA KVA locked rotor CODE LETTER: "G" or better
6. Service factor: 1.15
7. Type unless otherwise scheduled on Drawings
    a. Voltage: As scheduled on Drawings. Contractor shall verify actual site voltage prior to procurement.
    b. 1/2 horsepower and smaller
        (1) Single-phase phase, 60 hertz
        (2) With built-in auto-reset thermal overload protection
    c. 3/4 horsepower and larger
        (1) Three-phase, 60 hertz
        (2) Motors 50 horsepower and over: Reduced voltage start, suitable for star-delta starting or as scheduled on Drawings
    d. Electrically Commutated Motor (ECM)
        (1) Where scheduled on Drawings or equipment Specifications
        (2) Equal to GE ECM version 2.2 or greater
        (3) Programmed with fan curve for “constant airflow”
8. Bearings, unless otherwise scheduled on Drawings or equipment Specifications

a. Provide motors with double shielded, grease lubricated, ball bearings, with grease pockets on each side for regreasing in service. Provide inlet and outlet grease connections in motor housings for each bearing. Provide factory sealed permanently lubricated ball bearings on roof mounted equipment. Similar bearing may be provided on fractional horsepower motors. Provide sleeve bearings where so specified.
b. Ball type, unless otherwise noted
c. Sealed, permanently lubricated, unless otherwise noted or not available in motor size

B. Enclosure

1. Open drip-proof (ODP)

a. Provide ODP motors unless otherwise indicated

2. Totally enclosed (TEFC)

a. Motors outside the building or otherwise exposed to the weather
b. Non-ventilated: under 1/2 horsepower
c. Fan-cooled: 1/2 horsepower and larger

3. See schedules on drawings for other enclosures

C. Belt-connected motors

1. Foundation slide base
2. Shaft as required for aligning pulleys

D. Motors 1 horsepower and larger shall be NEMA Premium labeled and have guaranteed efficiencies equal to or exceeding NEMA Table 12-6D.

E. Multi-speed motors

1. Two speed motors shall be single winding 1800/900 rpm unless otherwise specified or indicated
2. Provide 1800/1200 rpm multi-speed motors of separate winding, variable torque type, unless otherwise specified or indicated.

F. Motors driven by variable frequency drives

1. Shall meet the requirements of NEMA MG-1 part 31.40.4.2
2. Where used for pumps or fans shall be capable of operating at 10 percent speed indefinitely

G. Electrically Commutated Motors (ECMs)

1. Brushless DC type with electronic commutation from 115 volt or 277 volt single phase power to a DC signal
2. Speed controllable from a minimum of 20% or less to 100% of full speed
3. Minimum 80% efficiency at all speeds
4. Provide one of the following as indicated on Drawings or Specifications

a. Where scheduled only: Potentiometer dial mounted on the exterior of the motor housing
b. Unless otherwise noted: 0-10 VDC control signal input and 0-10 VDC speed feedback output with pre-wired contacts. Motor shall shut off when speed signal is below

minimum.

2.3 VARIABLE SPEED DRIVES

A. All variable speed drives other than those that are factory packaged with equipment shall be supplied by one manufacturer.

B. Electrical Characteristics

1. Efficiency shall be not less than 97 percent at rated voltage, current, and frequency and fundamental power factor shall not be less than 98 percent at all speeds and loads
2. VSD shall maintain line noise (voltage harmonics) on the input electrical system at or below levels specified in IEEE 519 for a “General System.” Manufacturer shall include in submittals a harmonic distortion analysis (IEEE 519, 3 percent) for this particular jobsite. Provide as a minimum 5% impedance line reactors. The 5% impedance may be from dual (positive and negative DC bus) reactors or 5% AC line reactors. VSDs with only one DC reactor shall include AC line reactors.
3. VSD shall include EMI/RFI filters that allow the VSD assembly to be CE Marked and meet product standard EN 61800-3 for the First Environment restricted level.

C. Features and Accessories

1. Plain language LCD display (code numbers not acceptable); all set-up parameters, indications, faults, warnings, and other information must be displayed in words, not codes
2. Displays and meters for the following: Output voltage, output frequency, motor rpm, motor current, motor watts, speed signal input, last three faults
3. Hand-Off-Auto keyboard function with manual speed control, including bump-less transfer of speed reference when switching between Hand and Auto modes.
4. Input line fuses
5. Adjustable or multiple carrier frequencies up to 12 kHz. Include a carrier frequency control circuit that reduces the carrier frequency based on actual VSD temperature that allows the highest carrier frequency without derating the VSD or operating at high carrier frequency only at low speeds.
6. Isolated 4-20 mA or 0-10 Vdc speed signal input. If the input reference is lost the VSD shall, based on user selectable option, either (1) stopping and displaying a fault, (2) running at a programmable preset speed, (3) hold the speed based on the last good reference received, or (4) cause a warning to be issued.
7. Analog outputs for kW and speed; kW shall be accurate to ±3%
8. Digital outputs for alarm and motor on/off status; latter shall be based on field adjustable motor current that can indicate broken belt or coupling
9. Ability to automatically restart after an over-current, over-voltage, under-voltage, or loss of input signal protective trip. The number of restart attempts, trial time, and time between attempts shall be programmable for each fault type.
10. Controls

    a. Provide a minimum of two digital outputs that can be programmed for multiple purposes and also controlled through the DDC network interface device by the DDC system independent of other VSD functions or status. Control sequence possibilities shall include:

        (1) Contact to open fan discharge damper either with fan start or independent of fan operation, controlled via the DDC system and wait for the damper end switch to make before starting the drive; this shall function in the normal drive mode, bypass mode, and life safety mode (if part of smoke control system).

b. For fans used as part of IBC smoke control system, include:

(1) Programmable digital input that, when external contact is closed by life safety control system, causes VSD to start and operate at a preset adjustable speed, overriding automatic speed and on/off controls, manual speed settings and all keypad and HOA commands

(2) "Run to destruct" option so that when the digital input is closed, all internal and external safeties that might prevent the VSD from operating at the preset speed will be ignored or overridden

c. Provide built-in PID control loop, allowing connection of a pressure or flow signal to the VSD for closed loop control.

d. Provide factory installed BACnet/MSTP or Modbus RTU network interface that allows all VSD control points to be communicated to EMCS. See Section 23 09 00 Energy Management & Control Systems. At a minimum, the following points shall be provided:

(1) Read only: Speed feedback, output speed, current, % torque, kW power, kilowatt hours (resettable), operating hours (resettable), drive temperature, digital input status, analog input values, all diagnostic warning and fault information, keypad "Hand" or "Auto" selected, deceleration rate, and acceleration rate

(2) Read/write: On/off, output speed, digital output open/close, analog output values, remote fault reset, PID setpoint and gains, force the unit to bypass, maximum speed, and minimum speed

11. Enclosure

a. NEMA 3R enclosure for outdoor installation or unconditioned space

b. NEMA 1 enclosure for indoor installation in conditioned space or indirectly conditioned space such as return air plenum

c. UL Type 12 for wet mechanical rooms.

d. UL listed as plenum rated where located in supply, return, or outdoor air stream.

12. Thermostatically controlled cooling fans shall be provided where required to meet ambient operating conditions. Fans shall be designed for replacement without requiring removal of the VSD from wall mount or removal of circuit boards. Fan sound power shall be no greater than local noise sources where VSD is installed.

13. 3-contactor, constant speed bypass shall be provided to allow the motor to run across the line in the event of VFD shutdown. The transfer from the VFD to the line shall be accomplished manually by means of a selector switch. The bypass circuitry shall be enclosed in a separate well-mounted NEMA 1 cabinet. The bypass cabinet shall include a door interlocked input circuit breaker, a VFD output contactor, and a full voltage starting contactor (both contactors electrically interlocked), a thermal overload relay to provide motor protection, and a control power transformer. Mounted on the cabinet door shall be the bypass selector switch, motor fault light, power ON light, motor on VFD light, and motor on line light.

D. Equipment Protection and Safeties

1. VSDs short-circuit interrupting rating shall equal or exceed that fault current available at the drive.

2. VSD shall protect itself against all normal transients and surges in incoming power line, any grounding or disconnecting of its output power, and any interruption or run away of incoming speed signal without time delay considerations. Protection is defined as normal shutdown with no component damage.

3. The VSD shall be capable of sensing a loss of load (broken belt / broken coupling) and signal the loss of load condition. The VSD shall be programmable to signal this condition via a keypad warning, relay output and/or over the serial communications bus. Relay output shall include programmable time delays that will allow for drive acceleration from zero speed without signaling a false underload condition.
4. VSD shall protect itself against all phase-to-phase or phase-to-ground faults.
5. VSD shall be able to start into a rotating load at all speeds (forward or reverse) without trip.
6. Anti-regeneration circuit shall match the deceleration rate of the drive to that of the motor to prevent high bus voltage shutdown common to high inertia loads, such as fans.
7. VSD shall ride through an input power dip of 3 cycles without trip.
8. VSD shall operate properly at a -35% +30% voltage fluctuation from rated voltage.
9. VSD shall operate properly at a 10 percent frequency variation from rated frequency.
10. VSD shall employ three current limit circuits to provide trip-free operation: slow current regulation, rapid current regulation, and current limit switch-off limit. VSD shall be designed so that overcurrent trip shall be at least 315 percent of the drive's current rating.
11. VSD shall have the ability to set a maximum current available to the motor.
12. VSD shall withstand unlimited switching of the output under full load, without damage to the VSD. Operation of a disconnect switch between the motor and VSD shall not have an adverse effect on the VSD, whether the motor is operating or not. Controls conductors between the disconnect and the VSD shall not be required for the safe and reliable operation of the VSD.
13. The VSD shall withstand switching of the input line power up to 20 times per hour without damage to the VSD.
14. The VSD shall be capable of operating continuously at full load in the following service conditions

    a. Ambient temp: 30 to 104 degrees Fahrenheit
    b. Relative humidity: 0 to 95 percent, non-condensing

E. Warranty shall be 24 months from date of start-up certification including all parts, labor, travel time, and expenses.

2.4 MOTOR CONTROLLERS/STARTERS

A. General:

1. Manual reset, Class 20, thermal type overload protection for each phase, in accordance with NEMA ICS 2-2000 (R2005).
2. NEMA 3R enclosures for exterior application.
3. Equipment furnished with factory-installed starters shall also be equipped with individual motor disconnect and thermal magnetic circuit breakers or fuses as specified herein with lugs sized to receive a feeder as indicated on the Electrical Drawings.
4. 120 V secondary control power transformer with fused primary and secondary circuit in the enclosure.
5. Unused auxiliary contacts (installed on each contactor): 1 normally open, and 1 normally closed.

B. Motor starters shall be provided with provisions for interfacing with the Energy Management and Control System (EMCS) or other control and interlocking requirements.

1. For all magnetic starters, a minimum of one set of field reversible auxiliary contacts shall be provided with the starter.

C. For 3-phase motors, unless otherwise specified herein:

1. Combination magnetic type and thermal magnetic circuit breaker with:

    a. Circuit breakers having minimum AIC rating as specified in Division 26.
    b. External operating handle capable of being locked in the off or open position.
    c. Hand-off-automatic switch, except those manually controlled.
    d. Starters for motors 50 hp and larger shall be solid-state, reduced-voltage type.

D. For 1-phase, unless otherwise specified herein:

1. Manual starting switch with thermal overload protection and pilot light.
2. Magnetic across-the-line starters with overload protection and Hand-Off-Automatic switch, except for manually controlled equipment.

E. Provide control transformers for equipment with voltage above 240 volts, or as required for complete, operable systems.

F. Coordinate with DIVISION 26: ELECTRICAL

G. Refer to individual equipment sections for factory-provided controllers

1. Installed on equipment by manufacturer
2. Supplied with equipment by manufacturer for field installation

PART 3 - EXECUTION

3.1 INSTALLATION

A. See Section 23 05 48– Mechanical Sound and Vibration Control

B. Coordinate with work of other trades

C. Install in accordance with manufacturer's written installation instructions

D. Drives for packaged equipment shall be mounted and wired by equipment manufacturer

E. Mounting and power wiring of field mounted variable speed drives and other motor controllers is specified under Division 26 Electrical:

1. Where wall space is not available for mounting VSDs or other motor controllers, provide mounting struts securely mounted to the floor, roof, or adjacent structure
2. Where VSD has disconnect switch, locate VSD within sight of equipment served so that switch complies with NEC requirements

F. Set overload devices to suit motors provided in accordance with NEC

3.2 INSPECTION

A. Verify that adequate clearance between motor, controllers and adjacent walls or equipment is available to permit maintenance and repairs.

B. Check that motor and controller are properly supported and allows for proper alignment and tension adjustments as necessary for application.

3.3 PRE-OPERATING CHECKS

A. Before operating motors and controllers

1. Check for proper and sufficient lubrication
2. Check for correct rotation
3. Confirm alignment and re-align if required
4. Check for proper adjustment of vibration isolation.

3.4 STARTUP, TESTING, AND ADJUSTING

A. Start and test motors and controllers in accordance with manufacturers written installation instructions.

B. After starting motors

1. Check for high bearing temperatures
2. Check for motor overload by taking ampere reading at maximum operating conditions, with all valves open and individual motor running
3. Check for objectionable noise or vibration; correct as needed at no additional cost to the Using Agency

C. Variable speed drives

1. Certified factory start-up shall be provided. A certified start-up form shall be filled out for each VSD with a copy to the Professional and a copy kept on file by the manufacturer.
2. See Section 23 09 00 – Energy Management and Control Systems for points to be mapped from the drive controller to the EMCS; coordinate information addresses and other information required with the Section 23 09 00 – Energy Management and Control Systems contractor.
3. Set variable speed ramp-up rates on variable air volume systems slow enough to prevent high pressure trips and/or damage to duct systems. Coordinate with Section 23 09 00 EMCS contractor.
4. Set minimum speed for all applications in accordance with procedure indicated in Section 23 09 Energy Management and Control Systems.
5. Set maximum current limit setpoint to the motor to the motor's full load amps.
6. Set voltage to speed ratio (V/f) to “squared”.
7. For fans such as relief fans and cooling tower fans: Run fan through entire speed range and program out speeds that cause fan vibration.
8. After VSD is fully configured and programmed, all settings shall be documented and included with commissioning documentation in electronic format per Section 23 00 10 Mechanical General Provisions. The intent is to allow replacement drive electronics to be readily configured.

D. Motor Controllers/Starters

1. Provide starters, push buttons, thermal overload switches, and contactors for equipment covered in Division 23 unless otherwise specified herein. Installation of starters, push buttons, and thermal overload switches, not factory installed, is specified under Division 23.
2. Provide 120 V secondary control power transformers for control circuits where equipment is

served at 208 V or higher.

E. See Section 23 05 93– Testing, Adjusting, and Balancing

3.5 TRAINING

A. See Section 23 00 10 – Mechanical General Provisions

B. VSD manufacturer to provide one of the following:

1. 8-hours of customer training
2. Interactive Computer based training on VSD installation, start-up, programming, and trouble shooting
3. Professionally produced video cassette on VSD installation, start-up, programming, and trouble shooting in digital format

END OF SECTION 23 05 13

SECTION 23 05 16 - PIPING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Section Includes: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Expansion tanks
2. Storage tanks
3. Air separators
4. Bypass chemical feeders
5. Strainers
6. Suction diffusers
7. Thermometers
8. Pressure gauges
9. Test plugs
10. Flanges
11. Flex connectors

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing

Escutcheons	R			
Expansion tanks	R	R		R
Air separators	R			R
Bypass chemical feeders	R			R
Strainers	R			
Suction diffusers	R			
Thermometers	R	R		
Pressure gages	R	R		
Test plugs	R			

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Expansion tanks

1. Bell and Gossett ITT
2. Amtrol Inc.
3. Taco Inc.
4. Wessels
5. Or equal

C. Storage tanks

1. John Wood
2. Wessels
3. Or equal

D. Coalescing Air/dirt separators

1. Spirotherm
2. Bell & Gossett
3. Armstrong
4. Or equal

E. Bypass chemical feeders

1. J.L. Wingert Co.
2. Industrial Chemical Corporation
3. Or equal

F. Strainers

1. C.M. Bailey
2. Red-White
3. Armstrong

4. McAlear
5. Sarco
6. Steamflo
7. Mueller
8. R.P. & C. Company
9. Or equal

G. Suction Diffusers

1. Bell and Gossett ITT
2. Taco Inc.
3. Or equal

H. Thermometers

1. Weksler
2. Ashcroft
3. Trevice
4. Marsh
5. Or equal

E. Pressure gauges

1. Weksler
2. Dresser Industries, Ashcroft
3. H. O. Trerice Company
4. Weiss Instruments, Inc.
5. Or equal

F. Pressure-temperature test plugs

1. Peterson Engineering Company
2. Taco, Inc.
3. Or equal

G. Flexible Connectors

1. Flexicraft Industries
2. Flex-Weld, Inc.
3. General Rubber Corp.
4. Grinnell Corp.
5. Mason Industries
6. Mercer Rubber Co.
7. Metraflex Co.
8. Or equal

2.2 EXPANSION TANKS

A. Bladder type

1. Welded Steel
2. Working pressure: 125 pounds per square inch
3. Cleaned, prime coated
4. Steel base for floor mounted tanks

5. ASME Code
6. Bladder
7. Site glass
8. With required tappings
9. Precharge as indicated on drawings

2.3 AIR/DIRT SEPARATORS

A. Coalescing type

1. ASME construction: 125 pounds per square inch operating pressure
2. Steel tank
3. Drain and air vent connections
4. Inline air and dirt separators: inline coalescing/barrier medium tank type, capable of handling the water flow indicated on the Drawings, and constructed for 150 psig working pressure. All units shall include an integral copper tube bundle to serve as the turbulence suppressive coalescing medium which must completely fill the fitting's internal area. Units are to remove free entrained air during system start up and continue to eliminate dissolved air and dirt through continual circulation and the coalescing action of the tubes. Each fitting is to have a separate air and venting chamber to prevent system contaminants from harming the float and venting valve operation. At the top of the venting chamber shall be an integral float actuated brass air vent. There shall be no restriction in the connection from the venting chamber to the vent. The fittings are to include a valved side tap to flush floating dirt or liquids and for quick bleeding of large amounts of air during system fill or refill. Unit shall have the bottom of the vessel extended for dirt separation with the system connection nozzles equidistant from the top and bottom of the vessel and include a blowdown connection and valve. Unit shall also include a removable lower head to facilitate removal of tube assembly for cleaning and be of the size required to meet pressure drop and velocity criteria.

2.4 BYPASS CHEMICAL FEEDER

A. Batch feeder for closed circulating water systems
B. Capacity: 5 gallons
C. Steel shell and heads
D. Cap: Cast iron with Buna N "O" ring: Quarter-turn to open
E. 3/4 inch tappings for water in and out and drain
F. Operating pressure and temperature

1. Minimum rated operating pressure up to 125 pounds per square inch
2. Minimum rated operating temperature up to 250 °F
3. Design and installation as indicated

G. Wingert Model HD or equal

2.5 STRAINERS

A. Sizes

1. Screwed ends: to 2 inch
2. Flanged 2-1/2 inch and larger

B. Body

1. To 100 psi: 125 lb. wsp class, cast iron
2. 100 psi to 250 psi: 250 lb. wsp class, cast iron
3. Over 250 psi: 300 lb. wsp class, forged steel or cast steel

C. Screen

1. 304, 316 stainless steel or Monel, reinforced
2. Free area not less than 2-1/2 times inlet area
3. Perforations

    a. Water

        (1) To 8 inch: 1/8 inch
        (2) 10 inch and larger: 5/32 inch

D. Y-Type

1. Cast iron or bronze body as indicated
2. Screwed

    a. Faced cap, straight thread and gasket
    b. Mueller Steam Specialty or equal

        (1) Steel piping No. 1MFCB
        (2) Copper piping No. 35-1/2 M

3. Flanged

    a. Bolted cover
    b. Mueller Steam Specialty or equal

        (1) Steel - 125 psi steam, 200 psi water on gauge (WOG) - No. 751
        (2) Steel - 250 psi steam, 500 psi water on gauge (WOG) - No. 752
        (3) Copper - 150 psi steam, 225 psi water on gauge (WOG) - No. 851
        (4) Copper - 300 psi steam, 500 psi water on gauge (WOG) - No. 852

E. Basket type

1. Bolted cover, bottom drain connection
2. Mueller Steam Specialty Muessco No. 165 or equal

F. Provide Hubbell, Refrigerant Specialties, or equal on refrigeration system

2.6 SUCTION DIFFUSER

A. Angle type suction guide fitting

1. Flanged cast iron body
2. 125 pounds per square inch
3. Steel or cast iron guide vanes
4. Stainless steel orifice cylinder
5. Bronze start-up strainer
6. Free area five times cross section area of pump suction opening

7. Vane length no less than 2-1/2 times pump connection diameter
8. Adjustable support foot to carry weight of suction
9. System side connection size same as incoming pipe size

B. Use product manufactured by associated pump manufacturer if available

2.7 THERMOMETERS

A. Digital, self-powered

1. Display: Minimum 3/8" LCD digits, swivel mount for 360º viewing adjustment
2. Range: 0 to 300ºF
3. Sensor: Glass passivated thermistor
4. Accuracy: 1% of reading or 1ºF, whichever is greater
5. Resolution: 0.1 ºF between 0 and 200ºF
6. Recalibration: Internal potentiometer
7. Lux Rating: 10 Lux (one foot-candle)
8. Waterproof cover for outdoor installations
9. Ambient Operating Range:

    a. Temperature: -30/140°F
    b. Humidity: 0% RH to non-condensing

10. Power: Self-powered via integral photovoltaic cells
11. Weiss DVU or equal

B. Stem Length for Nominal Pipe Sizes

1. Below 4 inch: 3-1/2 inch stem, elbow mounted
2. 4-8 inch: 3-1/2 inch stem
3. 10-14 inch: 6 inch stem

2.8 PRESSURE GAUGES

A. Pipe or equipment mounted type

1. Diameter: 4 1/2 inch, except as noted
2. Case: black finished cast aluminum with flangeless back
3. Threaded black cast aluminum ring with gasketed glass face
4. Type 316 stainless steel spring tube
5. Stainless steel precision movement: Micrometer adjustment on needle
6. Accuracy: 0.5 of 1 percent full scale range
7. With calibration adjustment
8. Quarter turn stop cock: Materials compatible with service
9. Pressure snubbers

    a. Filter type
    b. For liquid, air and gas

10. Weksler Type AA44 or equal

B. Pressure gauge ranges in pounds per square inch gage

1. Chilled water pump: 0-200
2. Heating water pump: 0-160
3. Condensate pump set: 0-60
4. Diesel oil pump: 0-160
5. Emergency generator jacket water pump: 0-50
6. City water connection, connection to equipment: 0-100
7. Pressure gauges indicated on drawings or in specifications not indicated above to be submitted with appropriate range for review

2.9 PRESSURE/TEMPERATURE TEST PLUG

A. Solid brass with valve core

B. Valve core: Nordel

C. Fitted with a color coded and marked cap with gasket

D. Suitable for 500 pounds per square inch gage and 275ºF for water systems

E. Pete's Plug: No. 110/100XL with yellow cap or equal

2.10 FLANGES

A. Convoluted

B. Carbon steel, cold-formed

C. Weld-neck and blind flanges in conformance with the design criteria of Section VIII, Division I of the ASME Pressure Valve Code

D. Flanges drilled and tapped to match ANSI 150

E. All material to comply with requirements of ASTM A516

F. Gaskets: Teflon or as recommended by the flange manufacturer and suitable for the service

G. Slip-on flanges will not be permitted

H. 150-pound and 300-pound weld-neck and screwed steel flanges on steel lines to conform to ANSI Standard B16.5 for dimensions and ASTM A 181 Material Standard

2.11 FLEX CONNECTORS

A. General: Fabricated from materials suitable for system fluid and that will provide flexible pipe connections. Include 125-psig minimum working-pressure rating, unless higher working pressure is indicated, and ends according to the following:

1. 2” and Smaller: Threaded.
2. 2-1/2“ and Larger: Flanged.

B. Bronze-Hose, Flexible Connectors: Corrugated, bronze, inner tubing covered with bronze wire braid. Include copper-tube ends or bronze flanged ends, braze welded to hose.

C. Stainless-Steel-Hose/Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Include steel nipples or flanges, welded to hose.

D. Rubber, Flexible Connectors: CR or EPDM elastomer rubber construction, with multiple plies of NP fabric, molded and cured in hydraulic presses. Include 125-psig minimum working-pressure rating at 220 °F. Units may be straight or elbow type, unless otherwise indicated.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install items in accordance with manufacturer's instructions.

3.2 EXPANSION TANKS

A. Support from structure as indicated.

B. Make piping connections as indicated.

1. Expansion tank connection to the piping main shall be on the side of the pipe (3 o’clock or 9 o’clock).
2. On hot water systems, provide an anti-thermosyphon loop to prevent warm water from migrating to the tank.

C. Connect with ball valve with locked guard.

1. Relief valve shall be located on system-side of expansion tank isolation valve.

3.3 AIR/DIRT SEPARATORS

A. Install at lowest pressure, highest temperature point or where indicated on drawings.

B. Provide drain valve.

C. Install automatic vent with cock on top tapping. See Section 23 05 23 – Valves.

3.4 BYPASS CHEMICAL FEEDERS

A. Install feeder in convenient location where it may be easily refilled, maximum 4 feet above floor.

B. Install as indicated on drawings.

1. Support from floor
2. Valves on inlet, outlet and drain

3.5 STRAINERS

A. Wye-type: Where shown on drawings and ahead of all automatic flow control valves and pressure regulating valves

B. Basket-type strainers: Where shown on drawings

C. Install strainers in horizontal or vertical-down position

3.6 SUCTION DIFFUSERS

A. Provide on suction side of base mounted centrifugal pumps where indicated.

B. Support with floor mounted pipe and flange supports: From pump isolation base where provided, see Section 23 05 48 – Mechanical Sound and Vibration Control

3.7 INSTRUMENTATION

A. Install sensors and sensor wells to piping using thread o-lets welded or soldered to pipe, or other approved means. For piping smaller than 1.5 times well depth, wells shall be installed in the end of an elbow, or tee used in place of an elbow, to minimize obstruction

3.8 THERMOMETERS

A. Install thermometers for easy readability (height, distance, view angle) from floor, except thermometers at ceiling coils: Use remote mounted dial thermometers when mercury or spirit thermometers are not easily readable due to distance or position in piping.

B. Locate where shown on drawings.

3.9 PRESSURE GAUGES

A. Provide gauges where shown on drawings.

B. Install gauges on non-vibrating backing.

C. Provide instrument cocks for isolation and removal of gauge at each pressure connection point.

D. Install gauges for easy readability (height, distance, view angle) from floor, except gauges at ceiling coils

E. At pumps, install a single pressure gauge only piped to pump taps at the inlet and outlet of pump. Using two gauges or connecting to piping rather than pump taps is not acceptable.

3.10 PRESSURE-TEMPERATURE TEST PLUGS

A. Provide pressure/temperature test plugs where shown on drawings.

B. Install at all equipment, coil and heat exchanger connections. Install at each VAV terminal unit.

C. Also locate at all temperature/pressure wells for calibration, see Section 23 09 00 – Energy Management & Control Systems

3.11 INSPECTION

A. Verify that adequate clearance between piping specialties and adjacent walls or equipment is available to permit maintenance and repairs.

3.12 TESTING AND ADJUSTING

A. Test thermometers, pressure gauges and water meters for accurate indication with known calibrated master; calibrate or replace if not within 5 percent of reading.

B. Test air vent points to insure all air has been vented.

C. Test other piping specialties for proper operation.

D. See Section 23 80 00 – Mechanical Commissioning.

END OF SECTION 23 05 16

SECTION 23 05 23 - VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Service valves in hydronic and plumbing systems (other than gas and fire sprinkler)
2. Balancing valves
3. Check valves
4. Pressure reducing valves
5. Safety and relief valves
6. Vent and gas cocks
7. Manual and automatic air vents
8. Miscellaneous valves

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods
4. Section 22 11 16 – Domestic Water Piping
5. Section 23 21 12 – Heating and Cooling Piping

1.3 QUALITY ASSURANCE

A. Provide valves with manufacturer's name and pressure rating clearly marked on outside of body.

1.4 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Valves, all types	R	R		R
Manual and automatic air vents	R	R		

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Gate, ball, globe, and check valves

1. Nibco Inc.
2. Crane Company
3. Lunkenheimer Company

5. Or equal

N. Automatic air vents

1. Amtrol Inc./Thrush Division
2. Bell and Gossett ITT
3. Dole Valve Company
4. Or equal

2.2 GENERAL

A. Where possible, provide valves of same manufacturer for all Mechanical Sections per products in this Section.

B. For copper tubing provide solder-joint valves, flare fittings, or IPS-to-copper adaptor, sized for use with tubing and respective valve.

C. For flanged valves, provide streamline companion flanges, ANSI B16.5, 1988 150 class pounds per square inch

1. 255 pounds per square inch water on gage (WOG) at 150 degree Fahrenheit
2. 225 pounds per square inch water on gage (WOG) at 250 degree Fahrenheit unless indicated otherwise

D. Provide valves rated not less than 125 pounds per square inch steam working pressure, unless indicated otherwise.

E. Provide valve materials suitable for service and temperature of respective systems, especially with respect to discs, plugs, balls, linings, gaskets, and lubricants of globe valves, plug cocks, ball valves, etc.

F. Provide chain-operated hand wheels, rustproof chain and chain guide for following valves

1. Valves 8 feet or more above operating floor or platform
2. As noted

2.3 GATE VALVES

A. General

1. 2 inches and smaller a. Bronze

a. Class 125 (125 psi steam, 200 psi water)
b. Solid wedge
c. Union bonnet
d. Inside screw
e. Rising stem
f. Equal to Nibco

(1) Threaded: T-124
(2) Soldered: S-134

2. 2-1/2 inches and Larger

a. Iron body
b. Bronze trim

c. Class 125 (125 psi steam, 200 psi water)
d. Solid wedge
e. Outside screw and yolk (OS&Y)
f. Flanged
g. Equal to Nibco:

(1) 125 pounds per square inch: F617-0
(2) 250 pounds per square inch: F-667-0

B. Gate Valves Hose

1. Cast Bronze
2. 200 pounds per square inch water working pressure
3. Rising stem
4. Polished chrome plated
5. Satin chrome
6. Rough bronze
7. Polished bronze
8. NFPA approved
9. Cap chained to valve body
10. With escutcheon
11. Hose threads per requirements of Fire Authority having jurisdiction
12. Equal to Potter-Roemer

a. 2-1/2 x 2-1/2 = 4315
b. 2-1/2 x 3 = 4335

C. Gate Valves - Direct Buried

1. AWWA C500
2. Federal Specification WW-V-586, Type II, Class1
3. Cast iron
4. Pressure ratings: 2-12 inches - 200 pounds per square inch working, 400 pounds per square inch test; 14 inch and larger - 150 pounds per square inch working, 300 pounds per square inch test
5. Double disc, parallel seat
6. Non-rising stem
7. Joint ends to match piping
8. Equal to Clow Series F-5062 through F-5085

D. Valve Indicator Posts

1. U.L. listed
2. Two piece
3. Non-rising stem
4. Equal to Nibco NIP-1AJ

E. Lockshield Gate Valves: Same as gate valves, except key operated

2.4 GLOBE AND ANGLE VALVES

A. 2 inches and smaller

1. Bronze

2. Class 125 (125 psi steam, 200 psi water)
3. Renewable composition disc
4. Union Bonnet
5. Equal to Nibco

    a. Globe, Threaded - T-235
    b. Globe, Soldered - S-235
    c. Angle, Threaded - T-335
    d. Angle, Soldered - S-335

B. 2-1/2 inches and larger

1. Iron body, bronze trim
2. Class 125 (125 psi steam, 200 psi water)
3. Renewable composition disc
4. Outside screw and yolk (OS&Y)
5. Flanged
6. Equal to Nibco

    a. Straight - F-718-B
    b. Angle - F-818-B

C. Lockshield Globe Valves: Same as globe valves, except key operated

D. Needle Valves

1. 3/4 inch and smaller
2. Bronze
3. Class 125 (125 psi steam, 200 psi water)
4. Bronze spindle
5. Threaded
6. Equal to Crane

    a. Angle No. 89
    b. Globe No. 88

E. Stop-Check Valve

1. Cast iron body, bronze and stainless steel trim
2. 250 pounds per square inch steam
3. Bronze disc and seats
4. Outside screw and yolk (OS&Y)
5. Flanged
6. Equal to Nibco F-869-B

2.5 BUTTERFLY VALVES

A. Flange Type

1. Iron body and companion flanges

    a. Lug type at equipment locations and for dead head shut off only
    b. Wafer type at all other locations

2. 316 or 416 stainless steel stem, continuous with pinned disc
3. Disk shall be either

    a. 316 stainless steel
    b. Aluminum bronze
    c. Nickel encapsulated ductile iron
    d. EPDM encapsulated ductile iron
    e. Nylon encapsulated ductile iron

4. Steel seat or cast iron support ring
5. BUNA-N body and stem seal
6. Bronze or copper bushings
7. Stem to extend 1-1/4 inches minimum for insulated piping
8. Piping adjacent to lug type shall be flange removable while valve is in use
9. Equal to Nibco

    a. Lug Type

        (1) Series LD-2000
        (2) Lugs drilled and tapped to match ANSI 150 flanges
        (3) Use cap screws both sides

    b. Wafer Type: Series WD-2000

B. Operator

1. Infinite throttling handle with memory stop: smaller than 8 inches
2. Gear operators: 8 inches and larger

C. Factory tested bubble-tight at 150 pounds per square inch

2.6 BALL VALVES

A. 2 inches and smaller

1. Bronze
2. 316 SS trim
3. Two piece body
4. Standard port
5. 600 pounds per square inch water on gage (WOG) at 100 degree F, 125 pounds per square inch saturated steam
6. Equal to Nibco

    a. Threaded - T-580-70
    b. Soldered - S-580-70

B. 2-1/2 inches and larger: Not used

2.7 BALANCING VALVES

A. Calibrated Balancing Valves

1. Combination balancing and shut-off valves

2. Calibrated name plate and adjustable memory stop
3. Capped read-out valves
4. Pre-formed insulation
5. One differential pressure read-out meter for all valves in system
6. 2 inches and smaller

    a. Brass body
    b. Threaded or soldered ends
    c. Teflon seats
    d. 250 pounds per square inch at 250 degrees Fahrenheit

7. 2-1/2 inches and larger

    a. Ductile or cast iron body
    b. Flanged
    c. 175 pounds per square inch at 250 degrees Fahrenheit

8. Devices using venture type flow meter not acceptable (due to propensity for clogging and ease of putting valve with limited flow range in wrong direction)
9. Devices using Pitot tube or Annubar type flow meter not acceptable (due to propensity for clogging)
10. Devices using other than ball or butterfly valves shall not be used for coil isolation – a separate ball valve or butterfly valve shall be added for isolation (to ensure positive shut-off and to allow 90˚ open-close with memory stop).
11. Bell & Gossett type CB, or equal.

B. Combination shut-off, balancing, and check valve: Not allowed

2.8 CHECK VALVES

A. Check Valves, General Service

1. 2 inches and smaller

    a. Swing check
    b. Class 125 (125 psi steam, 200 psi water)
    c. Regrinding bronze disc
    d. Screw-in cap
    e. Threaded body
    f. Equal to Nibco

        (1) Threaded - T-413-Y
        (2) Soldered - S-413-Y

2. 2-1/2 inches and larger

    a. Swing Check
    b. Class 125 (125 psi steam, 200 psi water)
    c. Regrinding bronze disc
    d. Bolted cap
    e. Flanged body
    f. Equal to Nibco F-918-8

B. Silent Check Valves

1. For pump discharges:

    a. Except sump pumps and sewage ejectors
    b. Variable speed pumps. Check valve pressure drop shall vary roughly as the square of flow rate to near zero flow. Valves that use hydrodynamic profiles (e.g. Victaulic 716 check valve) resulting in high or erratic pressure drop at low flow rates are not acceptable.

2. 2 inches or smaller

    a. Center-guided, silent check
    b. Class 125 (125 psi steam, 200 psi water)
    c. Bronze trim
    d. Equal to Nibco

        (1) Threaded - T-480-Y
        (2) Soldered - S-480-Y

3. 2-1/2 inches or larger

    a. Globe body silent check
    b. Class 125 (125 psi steam, 200 psi water)
    c. Bronze trim
    d. Center-guided
    e. Flanged body
    f. Equal to Nibco F-910-W

C. Check Valves at Domestic Water Pressure Pumps

1. 2 inches and smaller

    a. Bronze
    b. 125 pounds per square inch steam, 175 pounds per square inch water on gage (WOG)
    c. Diaphragm actuated globe type
    d. Separate opening and closing speed control
    e. Threaded body
    f. Equal to Clayton No. 81-01

2. 2-1/2 inches and larger

    a. Iron body with bronze trim
    b. 125 pounds per square inch steam, 175 pounds per square inch water on gage (WOG)
    c. Diaphragm actuated globe type
    d. Separate opening and closing speed control
    e. Flanged body
    f. Equal to Clayton No. 81-02

D. Detector Check Valves

1. Automatic compound lever check valve and bypass bronze disc meter
2. Flanged galvanized cast iron body
3. With threaded or flanged bronze IBBM control and check valves
4. Equal to Hersey Model D.C.

2.9 PRESSURE REDUCING VALVES

A. For Water

1. 2 inches and Smaller

a. Bronze body, threaded
b. Equal to Watts Series 223

2. 2-1/2 inches and Larger

a. Iron body, flanged
b. Equal to Watts No. 2300

2.10 SAFETY AND RELIEF VALVES

A. Use “pressure relief valves” for unheated liquids

B. Use “safety relief valves” for heated liquids

C. ASME rated direct spring-loaded type

1. Lever operated
2. Non adjustable factory set discharge pressure

D. Constructed, rated and stamped in accordance with ASME

1. Relief valves: for unheated liquids
2. Safety relief valves: for heated liquids
3. Safety valves for gases and vapors: Including air and steam

E. Set pressures and ratings

1. Suitable and rated for system pressure and temperature: For safety relief valves, minimum temperature rating: saturated steam temperature corresponding to pressure 10 percent higher than valve set pressure
2. Set pressure as indicated on Drawings: Not to exceed pressure rating of protected equipment

F. Valves to open, under test, at set pressure with following tolerance

1. Set pressure up to 70 pounds per square inch gage: plus or minus 2 pounds per square inch
2. Set pressure, above 70 pounds per square inch gage: plus or minus 3 percent

G. Capacities

1. Valves shall have capacity to relieve maximum possible generated energy while maintaining pressure in protected equipment at no more than 10 percent above vessel working pressure.
2. Greater than make-up pressure reducing valve capacity
3. Equipment relief valve capacity to exceed rating of connected equipment
4. Provide multiple valves if required for capacity even though only one valve may be shown on Drawings

H. Maintain pressure in protected equipment at not more than following

1. Low pressure Boilers: 5 pounds per square inch above boiler working pressure
2. High pressure Boilers: 6 percent above boiler working pressure
3. Unfired Pressure Vessels: 10 percent above vessel working pressure

I. Provide multiple valves if required for capacity even though only one valve may be shown on Drawings: Factory manifold

J. Safety and Relief Valves: Similar to Consolidated

K. Relief Valves, Water: Equal to Watts

2.11 VENT COCKS

A. Bronze body, 1/4 inch size

B. Lever handle

C. 125 pounds per square inch steam working pressure

D. Equal to Weiss LC-14

2.12 MANUAL AIR VENTS

A. Construction

1. Vertical
2. Provide 1/8 inch brass needle valve at top of chamber
3. To 3 inch pipe: Line size air chamber, 12 inch long
4. 4 inch to 8 inch: Line size air chamber, 6\inch long
5. 10 inch and larger: Line size pipe cap

2.13 AUTOMATIC AIR VENTS

A. Float type

1. With isolating valve
2. Brass or semi-steel body
3. Float copper or stainless steel
4. Stainless steel valve and valve seat
5. Suitable for system operating temperature and pressure
6. Non-opening on negative pressure
7. Equal to Thrush/Amtrol No. 720

B. Disc type

1. All brass with hydroscopic fiber discs
2. Vent ports
3. Adjustable cap for manual shut-off
4. Integral spring loaded ball check valve
5. Equal to Dole

C. Threaded vent connection for piping vent to drain

D. Upstream ball valve for isolation

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades

B. Install valves in accordance with manufacturer's written installation instructions

C. Provide valves as shown on drawings, and provide shutoff valves around all equipment whether shown with valves on drawings or not.

D. Provide all valves (except control valves), strainers, and check valves of same size as the pipes in which they are installed unless otherwise indicated

E. Pressure rating of valves same as piping in which installed

F. Install valves with stems upright or horizontal, not inverted

G. Install valves with cast directional arrows in direction of flow

H. Install all globe and angle valves to close against the pressure

I. Support line valves at the valve in addition to regularly spaced pipe supports shown and specified

J. Check valves

1. Provide silent check valves at discharge of pumps. Triple duty valves shall not be used as a substitution for check and shut-off valve.
2. Install swing checks and gravity closing lift checks in horizontal position.

K. Provide blow-down ball valves and hose adaptors at strainers, air separators, tanks, pipe traps, equipment drains, etc. of same size as strainer blow-off connection

L. Provide drain valves at main shut-off valves, low points of piping and apparatus

M. Provide extended valve stems to clear insulation on insulated valves.

N. Locate wheel handles to clear obstructions with hand

O. Install valves only in accessible locations

P. Wherever possible, install valves accessible from floor level. Provide guided chain operators on valves over 7 feet above floor in equipment areas. Extend chains to within 6 feet 6 inches of floor.

Q. Locate equipment shut-off valves to be accessible without climbing over equipment

R. Provide operating handles for all valves and cocks without integral operators, unless otherwise noted. Provide adequate clearance for easy operation

S. Provide discharge pipe to atmosphere from all relief and safety valves, sized with area equal to sum of outlet areas of all valves connected thereto, unless indicated larger. Extend to over code compliant drain receptacle with airgap.

T. Provide ball valves to isolate shock absorbers

U. Provide open-ended line valves with plugs or blind flanges

3.2 VALVE APPLICATIONS

A. Valves shall be limited to the applications listed below. Where this section disagrees with drawings, obtain clarification from Professional and provide as directed by the Professional at no additional cost to the Using Agency.

B. Gate Valves

1. Shut-off: water (use ball valves where possible, Professional shall approve use of gate valves aboveground)

C. Globe and Angle Valves: Throttling and shut-off: water, air and steam

D. Plug cocks: Not used

E. Butterfly valves

1. Throttling and shut-off: water
2. Use in HVAC systems interchangeably in place of gate, globe and angle valves

F. Ball valves

1. Throttling and shut-off: water
2. Use in HVAC and domestic water piping 2-1/2 inches and smaller interchangeably in place of gate, globe and angle valves

3.3 AIR VENTS

A. Manual air vents

1. Locate

a. As shown on drawings
b. At all high points in closed piping systems
c. At equipment with vents, such as coils

2. 1/4 inch copper tube discharged into nearest drain or with 180 degree bend to discharge into portable container
3. Extend tubing or piping as required to make valve accessible

B. Automatic air vents

1. Locate as shown on drawings
2. Provide manual cock at automatic air vents. Shut after system is free of air
3. 1/4 inch copper tube discharged into nearest drain

3.4 FIELD QUALITY CONTROL

A. Test valve bonnets for tightness. Test operate valves from closed-to-open-to-closed position while valve is under test pressure.

B. Test automatic valves including solenoid valves, expansion valves, water regulating valves, pressure reducing valves, pressure relief valves, safety valves and temperature and pressure relief valves for proper operation at settings indicated.

C. Insure that valves are field checked for packing and lubricant and that disc is for service intended. Replace leaking packing at no additional cost to the Using Agency. Service valves which do not operate smoothly and properly with suitable lubricant before placing in operation at no additional cost to the Using Agency.

3.5 INSPECTION & COMPLETION

A. Verify that adequate clearance between valves and adjacent walls or equipment is available to permit maintenance and repairs.

B. Verify valve set for normal operation.

C. Valves tags, see Section 23 05 53 – Mechanical Identification

D. See Section 23 08 00 – Mechanical Commissioning

E. See Section 23 05 93 – Testing, Adjusting and Balancing

END OF SECTION 23 05 23

SECTION 23 05 29 HANGERS AND SUPPORTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Pipe and duct hangers, supports and associated anchors
2. Thermal hanger shields for insulated piping

B. Related Sections include the following:

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 05 48 – Mechanical Sound and Vibration Control
3. Division 21 – Fire Protection Work
4. Division 22 – Plumbing Work

1.3 REFERENCE STANDARDS

A. American Society of Mechanical Engineers: ASME Section VIII – Boiler and Pressure Vessel Code – Pressure Vessels

B. Pipe Supports: ANSI B31.1, Power Piping

C. Duct Hangers: SMACNA Duct Manuals

1.4 DEFINITIONS

A. MSS: Manufacturers Standardization Society for the Valve and Fittings Industry.

B. Terminology: As defined in MSS SP-90, “Guidelines on Terminology for Pipe Hangers and Supports”.

1.5 PERFORMANCE REQUIREMENTS

A. Design channel support systems for piping to support multiple pipes capable of supporting combined weight of supported systems, system contents, and test water.

B. Design heavy-duty steel trapezes for piping to support multiple pipes capable of supporting combined weight of supported systems, system contents, and test water.

1.6 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Pipe hangers and supports	R			R
Structural attachments	R			R
Pipe protection and thermal hanger shields	R			
Expansion shields	R			

1.7 QUALITY ASSURANCE

A. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications".

PART 2 - PRODUCTS

2.1 GENERAL

A. Terminology used below is as defined in MSS SP-90, "Guidelines on Terminology for Pipe Hangers and Supports." Pipe hangars and supports shall comply with MSS SP-58 requirements for materials, design and manufacturer, MSS SP-69 requirements for selection and design and MSS SP-89 requirements for fabrication and installation. All hangers shall be furnished and installed complete with rods and supports proportioned to the size of piping or equipment to be supported.

2.2 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Hangers, Inserts and Supports

1. Fee and Mason
2. B-Line Systems, Inc.
3. ITT Grinnell Corporation
4. Kin-Line, Inc.
5. Unistrut
6. Superstrut
7. Midland-Ross Corp.: Superstrut

8. Elcen Metal Products Company

C. Pipe Protection and Thermal Hanger Shields

1. Pipe Shields, Inc.
2. Elcen Metal Products Company
3. Midland-Ross Corp.: Superstrut
4. Uni-Grip
5. Kin Line

D. Expansion Shields

1. ITT Phillips Drill Co.: Red Head
2. Hilti Fastening Systems
3. Omark Industries, Inc.
4. Ramset Fastening Systems

E. Pipe Stand Supports

1. B-Line Systems, Inc.
2. Grinnell Corp.
3. PHD Manufacturing, Inc.
4. PHS Industries, Inc..

F. Powder-Actuated Fastener Systems:

1. Hilti, Inc.
2. ITW Ramset/Red Head.
3. Masterset Fastening Systems, Inc.

G. Insulation Protectors:

1. B-Line Systems, Inc.
2. ITT Grinnell Corporation
3. PHD Manufacturing, Inc.
4. PHS Industries, Inc..

H. Roof Pipe Supports

1. Mifab
2. Or equal

I. Miscellaneous Devices

1. Kopty
2. Wejit

2.3 PIPE HANGERS AND SUPPORTS

A. Model numbers are Superstrut, unless otherwise indicated

B. Provide electro-chromate, galvanized or factory painted finish; no plain, "black" hangers allowed

C. Dielectric Isolators: All uninsulated copper tubing systems; Superstrut isolators or equal,

Cush-A-Strip or Cush-A-Clamp on all pipe clamps; for individual hangers, use felt lined hangers

D. Individual Pipe Hangers

1. Cold pipe all sizes: Clevis hanger, No. C710
2. Hot pipe sizes up to 4 in: Clevis hanger, No. C710
3. Hot pipe sizes above 6 in: Adjustable steel yoke and cast iron roll No. C729

E. Multiple or Trapeze Hangers

1. Factory channel

    a. 12 gauge thick steel
    b. Single or double section
    c. Electro-chromate finish
    d. Strutnuts: Series A-100 or CM-100
    e. Straps: Series 702
    f. Other accessories
    g. No. A-1200 or A-1202

2. Hot pipe sizes 6 in and larger: cast iron roll and stand; C728 or CR728

F. Wall Supports

1. Pipe sizes up to 3 in: Steel bracket No. C738
2. Pipe sizes 4 in and larger: Welded steel bracket C-735
3. Hot pipe sizes 6 inches and larger

    a. Welded steel bracket No. C739
    b. Adjustable steel yoke and cast iron roller No.C729

G. Vertical Support

1. Riser clamp Series C-720

H. Floor Support:

1. Hot pipe sizes up to 4 in; cold pipe, all sizes

    a. Adjustable cast iron saddle No. R786
    b. Locknut nipple
    c. Floor flange

2. Hot pipe sizes 6 in and larger: Adjustable cast iron roll and stand No. R-730-C

I. Thermal Hanger Shields

1. 360 degree high density insert

    a. 100 psi waterproofed calcium silicate, asbestos-free, K=0.38, encased in a 360-degree galvanized sheet metal shield, ASTM A653
    b. See Section 23 07 00 Mechanical Insulation
    c. Same thickness as adjoining pipe insulation

2. 360 degree galvanized sheet metal shield

a. Shield length and gauges

Pipe Size	Shield Length	Minimum Gauge
1/2-1 1/2	4	26
2 - 6	6	20
8 - 10	9	16

3. Insert to extend one inch beyond metal shield ends on chilled water piping
4. Use double layer shield on bearing surface for

   a. Roller hangers
   b. Support spacing exceeding 10 feet

5. Pipe Shields Incorporated or equal

J. Pipe Isolators

1. Hanger with felt padding
2. Tolco Fig. 3F felt lined hangers or equal

K. Insulated Pipe Supports

1. Pipe supported on rod hangers - use Models A1000, A2000, A3000, 4000 and A9000
2. Pipe supported on flat surfaces - use Models A1000, A2000, A5000, A6000, A7000, A7200 and A7400 Series
3. Pipe supported on pipe rolls - use Models A3000, A4000, A5000, A6000, A8000, A8200 and A8400 Series
4. Model designations are Pipe Shields, Inc. or equal; use only models designed for service for which supports are to be used

L. Anchors and Guides: Provide anchors and guides where indicated on the Drawings and as required. Structural inserts shall be high density calcium silicate compressive strength 600 pounds per square inch. Guide slide pads shall be Teflon. Ensure that slide accommodates pipe movement over full range of service and out-of-service temperatures. Guides shall be Pipe Shields, Inc. Model #B3000 or equal. Anchors shall be Pipe Shields, Inc. Model #C4000 or equal. See Section 23 07 00 – Mechanical Insulation.

M. Insulated Pipe Strap

1. 1/2 in to 1 in plumbing piping in wood frame construction
2. Felt insulated
3. Nailable pipe straps; In lieu of other hangers and dielectric isolators
4. Kopty or equal

N. Escutcheons: See Section 23 05 00 – Basic Mechanical Materials and Methods

O. Flashing and Sleeves

1. Flashings

   a. See Division 7 – Thermal and Moisture Protection
   b. Flash and counter flash watertight all pipe and duct penetrations of roofs and exterior walls

c. Flash pipes through roofs with ITWBuildex Dektite
d. Flash vents through roofs with

(1) Minimum 24 gage soldered roof jack for flat surface roofs
(2) Minimum 4 pound lead soldered roof jack for roofs other than flat surface roofs
(3) Vandal caps
(4) Provide counter-flashing sleeves and storm collars
(5) Caulk counter-flashing and storm collar weather tight
(6) Other flashings shall be minimum 24-gage galvanized sheet metal

2. Sleeves

a. Through exterior concrete walls below grade and floor slabs on grade

(1) Schedule 40, galvanized steel pipe sleeves
(2) Seal annular space between pipe and sleeve water tight with one of the following

a) Thunderline Link-Seals
b) Calpico Pipe Linx
c) Oakum sealed in with mastic
d) Provide membrane clamps at penetrations of membranes
e) Or equal

b. Other concrete walls, floors and roofs

(1) Adjustable telescopic metal sleeves
(2) Tightly pack annular space between pipe and sleeve with fiberglass. Seal both sides with mastic

c. For insulated piping, sleeve diameter shall not be less than diameter of insulation

d. Terminate sleeves flush with walls, and ceiling

e. For exposed vertical pipe, extend sleeves 1 inch above finished floor except where escutcheons are required

f. Packing through fire rated partitions on of following

(1) 3M Penetration Sealing Systems (PSS 7909) and 3M Fire Barrier Caulk and Putty
(2) Dow-Corning LTV Silicone foam
(3) Or equal

3. Separate piping through walls, other than concrete walls, from contact with wall construction materials; use non-hardening caulking

4. Install insulation on piping in walls which require insulation at time of installation

2.4 DUCT HANGERS AND SUPPORTS

A. See Section 23 31 13 – Ducts.

2.5 DUCT AND PIPE SUPPORT AT ROOF LEVEL.

A. The Contractor shall coordinate pipe work and ductwork to provide access to all equipment. The services at roof level indicated on our details provide the minimum clearance required for pipe work and ductwork for maintenance of the roof. The plans indicate higher elevations where necessary for access. Where pipe work and ductwork cross over at the same point, the pipe work shall run underneath the ductwork. The Contractor may propose a combined structure, for approval, to support the pipes and ducts at roof level. The contractor shall provide calculations by a certified licensed engineer in the state of Mississippi once the conceptual support has been approved. The main path of egress shall be maintained clear at 7’-6”.

2.6 STRUCTURAL ATTACHMENTS

A. Model Numbers are Superstrut, unless otherwise indicated

B. Anchor Bolts: Size as specified for hanger rods

C. Concrete Inserts

1. Malleable iron
2. Place reinforcing steel through insert as recommended by manufacturer for recommended loads
3. No. 452 or equal

D. Beam Clamps

1. All with U-568 safety strap
2. All with locknuts on

a. Set Screw
b. Hanger rod

3. Bottom flange attachment

a. Loading 150 pound and less: U-563
b. Loading 150 pound to 300 pound: U-562
c. Loading more than 300 pound: U-560

4. Top flange attachment

a. Permitted only when bottom flange attachment cannot be used
b. Loading 400 pound and less: M-777
c. Loading more than 400 pound: M-778

E. Welded Beam Attachments

1. No. C-780 or equal

F. Side Beam Brackets

1. No. 542 or equal

G. Hanger Rods

1. ASTM A575 Hot rolled steel
2. ANSI B1.1 Unified Inch Screw Treads
3. Threaded both ends, threaded one end, or continuous threaded

H. Hanger Rod Fixtures

1. Turnbuckles: No. F-112 or equal
2. Linked Eye Rod

    a. Rod swivel
    b. No. E-131 or equal

3. Clevis: No. F-111 or equal

I. Powder or Gas Actuated Anchors

1. Not allowed on initial building construction; allowed only for revisions made after initial construction and with approval of Using Agency
2. Hardened steel stud with threaded shank; size of shank to match hanger rod size
3. Use only with non-shock loads
4. Maximum load safety factors:

    a. Maximum anchor load: 100 pounds
    b. Static loads - 5
    c. Vibratory loads - 8-10

5. For concrete and steel; not to be used for light weight concrete, brick or concrete block
6. 10% testing rate required, testing by contractor
7. Omark Drivit or equal

J. Expansion Shields

1. Carbon-steel anchors, zinc coated
2. Stainless steel for corrosive atmospheres
3. For normal concrete use

    a. Self-drilling anchor
    b. Sleeve anchor
    c. Stud anchor

4. For thin concrete use: wedge anchor
5. For brick or concrete block use: sleeve anchor
6. Maximum load safety factors

    a. Static loads - 4
    b. Vibratory loads - 8 - 10
    c. Shock loads - 8 - 10

7. Size to suit hanger rods
8. ITT Phillips Red Head or equal

K. Steel Deck Inserts

1. Factory stud with

a. Clip
b. Spring
c. Coupling

2. ITT Phillips Red-Head or equal

L. Miscellaneous Metal

1. Steel plate, shapes and bars: ASTM A36
2. Steel pipe columns: ASTM A53, Schedule 40, black
3. Bolts and nuts: regular hexagon-head type, ASTM A307, Grade A
4. Lag bolts: square head type, Fed. Spec. FF-B-561
5. Plain washers: round, carbon steel, Fed. Spec. FF-W.92

2.7 ROOF PIPE SUPPORTS

1. All piping HVAC, plumbing, gas, etc. located above the roof (and supported by the roof) shall be supported utilizing the following roof supports.
2. Rubber support base with 1-5/8-inch galvanized steel channel.
3. Materials:

a. Base: 100% recycled rubber, UV resistant
b. Channel: 14 gauge galvanized steel (1-5/8-inch wide x 1-5/8-inch high)

4. Maximum load: 750 lbs for each 9.6-inch long support
5. Include strut clamp
6. Manufactures

a. Mifab C6 series
b. Or equal

2.8 MISCELLANEOUS MATERIALS

A. Powder-Actuated Drive-Pin Fasteners: Powder-actuated-type, drive-pin attachments with pull-out and shear capacities appropriate for supported loads and building materials where used.

B. Mechanical-Anchor Fasteners: Insert-type attachments with pull-out and shear capacities appropriate for supported loads and building materials where used.

C. Structural Steel: ASTM A36/A36M, steel plates, shapes, and bars, black and galvanized.

D. Concrete: Normal weight concrete (145 pcf) using Type I Portland Cement, 1" maximum size coarse aggregate to provide a minimum 28 day compressive strength of 3000 psi.

E. Grout: ASTM C1107, Grade B, factory-mixed and -packaged, nonshrink and nonmetallic, dry, hydraulic-cement grout.

1. Characteristics: Post hardening and volume adjusting; recommended for both interior and exterior applications.
2. Properties: Nonstaining, noncorrosive, and nongaseous.
3. Design Mix: 7000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 PIPE HANGERS, SUPPORTS AND GUIDES

A. Specific hanger requirements are specified in Sections specifying equipment and systems.

1. Assure adequate support for pipe and contents
2. Provide adjustable hangers for all pipes complete with inserts, adjusters, bolts, nuts, swivels, all-thread rods, etc., except where specified otherwise
3. Arrange for grouping of parallel runs of horizontal piping to be supported together on trapeze type hangers where possible. Where piping of various sizes is to be supported together by trapeze hangers, space hangers for smallest pipe size or install intermediate supports for smaller diameter pipe. Do not use wire or perforated metal to support piping and do not support piping from other piping.
4. Except as otherwise indicated for exposed continuous pipe runs, install hangers and supports of same type and style as installed for adjacent similar piping
5. Install all cast iron piping in accordance with Cast Iron Soil Pipe Industry (CISPI) Standards
6. Support all piping within 2 feet of each change of direction on both sides of fitting
7. Thermal hanger shields shall be provided at hangers and supports where piping is insulated
8. Prevent vibration or swaying
9. Provide for expansion and contraction
10. Supports of wire, rope, wood, chain, strap perforated bar or any other makeshift device not permitted
11. Comply with applicable requirements at ANSI B31.1 and B31.2 for piping
12. Support piping independently so that equipment is not stressed by piping weight of expansion
13. See Section 23 05 48 – Mechanical Sound and Vibration Control for mechanical sound and vibration control
14. See Section 23 05 48 – Mechanical Sound and Vibration Control for hangers, guides, anchors and supports requiring vibration isolation units
15. Hangers and supports shall have minimum safety factor of five (5), based on ultimate tensile or compressive strength, as applicable, of material used; base calculations on equipment's heaviest operating weight and pipes full of water
16. Install additional supports or braces if, during normal operation, piping should sway, crawl or vibrate. Piping shall be immobile
17. Install thrust blocks as required to prevent sway

B. Horizontal piping, except as noted

1. Adjustable clevis type and rod; all services at or below 250 degrees F
2. Rollers or slide bases: not required
3. Trapeze hangers; guide individual pipes on trapezes with 1/4 inch U-bolt or Superstrut 702 pipe clamp
   a. Install thermal hanger shield at each support point
4. Galvanized sheet metal shields between hangers and PVC piping
5. Threaded steel rods

   a. 2 in vertical adjustment with 2 nuts each end for positioning and locking
   b. Size to 12 in inside pipe size (IPS)

Pipe, IPS	Rod
to 2 inch	3/8 inch

2-1/2 inch and 3 inch	1/2 inch
4 inch	5/8 inch
6 inch and 8 inch	3/4 inch
10 inch and 12 inch	7/8 inch
14 inch and 18 inch	1 inch
20 inch and 30 inch	1-1/4 inch

c. Size above 12 inch IPS and multiple pipe standards: safety factor of 5 on ultimate strength on area
d. For double rod hangers: 1 size smaller than above

C. Vertical piping

1. Base support

a. Base elbow or welded equivalent
b. Bearing plate on structural support

2. Guides

a. At every third floor but not to exceed

(1) 25 feet for piping to 2 inch
(2) 36 feet for piping 2-1/2 inch to 12 inch
(3) 50 feet for piping 14 inch and larger

b. Or as otherwise designed by the Vibration Isolation vendor; coordinate with Section 23 05 48 – Mechanical Sound and Vibration Control

3. Top support

a. Special hanger or saddle in horizontal connection
b. Provisions for expansion

4. Intermediate supports: steel pipe clamp at floor

a. Bolted and welded to pipe
b. Extension ends bearing on structural steel or bearing plates

5. For multiple pipes: coordinate guides, bearing plates and accessory steel

D. Horizontal insulated piping

1. Install saddles for rollers or slide bases
2. Install thermal hanger shields for all other types of supports
3. See Section 23 07 00 – Mechanical Insulation for insulation connection to shields

E. Vertical insulated piping

1. Install thermal hanger shields at guides
2. See Section 23 07 00 – Mechanical Insulation for insulation connection to shields

F. Install Pipe Isolators between hangers and piping for all uninsulated copper tubing.

G. Spring Supports for Piping

1. See Section 23 05 48 – Mechanical Sound and Vibration Control

H. Miscellaneous Steel

1. Provide miscellaneous steel members, beams, brackets, etc., for support of work in this division unless specifically included in other divisions

I. Roof pipe supports shall be installed per manufacturer's recommendations in coordination with the roofing system and company holding the roof warranty.

3.2 PIPE SUPPORT SPACING

A. Maximum spacing for horizontal piping

Type of Pipe	Size	MAXIMUM SPACING
Steel	1-1/2 inch and smaller	7 feet
	2 inch and larger	10 feet
Copper	3/4 inch and smaller	5 feet
	1- 1-1/4 inch	6 feet
	1-1/2 - 3 inch	8 feet
	4 inch and larger	10 feet
Plastic	3/4 inch and smaller	3 feet

B. Spacing Notes: Additional supports at

1. Changes in direction
2. Branch piping and runouts over 5 feet
3. Concentrated loads due to valves, strainers and other similar items
4. At valves 4 inch and larger in horizontal piping, support piping on each side of valve

C. Parallel piping on trapezes

1. Maximum spacing to be that of pipe requiring closest spacing

3.3 ATTACHMENT TO STRUCTURE

A. Concrete

1. Use inserts for suspending hangers from reinforced concrete slabs, walls and sides of reinforced concrete beams wherever practicable
2. Set inserts in position in advance of concrete work
3. Provide reinforcement rod in concrete for inserts carrying

    a. Pipe over 4 inch
    b. Ducts over 60 inches wide

4. Where concrete slabs form finished ceiling, finish inserts flush with slab surface
5. Where inserts are omitted, install hangers with expansion shields
6. Through-deck support

    a. Drill through concrete slab from below
    b. Provide rod with recessed square steel plate and nut above slab

7. Where permitted by Using Agency and only for revisions made after initial construction, powder actuated anchors or expansion shields may be used in lieu of inserts

    a. In bottom of thick slabs
    b. In thin slab construction, only in sides of beams

8. Pre-Cast Concrete

    a. Use pre-set inserts
    b. Where inserts are not available, field drill through beam or joists at locations as directed by Professional
    c. Through bolt side beam bracket to beam or joist

9. Poured-In-Place Concrete

    a. With metal form or underdeck
    b. Before concrete is poured

        (1) Field drill hole through metal deck
        (2) Provide bearing plate, nut and locknut on rod; or install factory-made steel deck inserts specified hereinbefore

    c. After concrete is poured

        (1) Install hangers with expansion shields

B. Steel Beam Anchors

1. Beam or channel clamps
2. Do not cut or weld to structural steel without permission of structural engineer

C. Steel Deck Anchors

1. Concrete filled: as specified above
2. Decking without concrete

    a. Through rod Support

        (1) Weld to square plate, 1/4 in thick
        (2) Plate to distribute load over minimum of two full cells
        (3) Coordinate with floor layouts to clear cells with wiring

D. Side Wall Supports

1. Concrete walls

    a. As specified for hangers

2. Stud Walls

a. Toggle bolts
b. Studs welded to structural studs

E. Support Spreaders

1. Install spreaders spanning between structural members when hangers fall between them, and hanger load is too great for slab or deck attachment
2. Spreaders may be one of methods listed below, or combination of both as required

a. Fabricated from structural channel

(1) End fittings bolted or welded
(2) Secure to structural members

a) As required by construction
b) As reviewed by Structural Engineer

b. Formed channels with fittings, Superstrut or equal

(1) Submit manufacturer's calculations for installation

3.4 DUCT HANGERS AND SUPPORTS

A. See Section 23 31 13 – Ducts

3.5 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure above or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

3.6 METAL FABRICATION

A. Cut, drill, and fit miscellaneous metal fabrications for heavy-duty steel trapezes and equipment supports.

B. Fit exposed connections together to form hairline joints. Field-weld connections that cannot be shop-welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.7 ADJUSTING

A. Hanger Adjustment: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

3.8 PAINTING

A. Painting and Touching Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.

END OF SECTION 23 05 29

SECTION 23 05 48 – MECHANICAL SOUND AND VIBRATION CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Vibration isolators for equipment
2. Vibration isolators for piping systems
3. Equipment bases
4. Inertia bases

B. Related Sections

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 05 00 – Basic Mechanical Materials and Methods
3. Duct sound attenuators, see Section 23 33 00 – Duct Accessories
4. Section 23 05 16 – Piping Specialties

1.3 REFERENCE STANDARDS

A. AFBMA – Anti-Friction Bearing Manufacturer's Association

B. ASHRAE – American Society of Heating, Refrigerating and Air Conditioning Engineers

C. NEMA – National Electrical Manufacturer's Association

D. Underwriters' Laboratories, Inc.: UL 778 – Motor Operated Water Pumps

E. American Society of Mechanical Engineers: ASME Section VIII – Boiler and Pressure Vessel Code – Pressure Vessels

F. Published specifications standards, tests or recommended methods of trade, industry or governmental organizations apply to work in this section where cited below

1. Mason Industries “Seismic Restraint Guidelines for Suspended Piping, Ductwork, and Electrical Systems”
2. SMACNA and PPIC “Guidelines for Seismic Restraints of Mechanical Systems and Plumbing Piping Systems”.

G. Publication references below are basic industry standards; however, regulatory requirements may

reference, modify or supersede:

1.4 QUALITY ASSURANCE

A. Qualifications

1. Manufacturer

    a. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture for not less than five years

B. Manufacturer or manufacturer's representative of vibration isolation equipment shall have the following responsibilities

1. Determine vibration isolator sizes and locations
2. Provide piping and equipment isolation systems as scheduled or specified
3. Guarantee specified isolation system static deflection under installed actual load.
4. Provide installation instructions, drawings and field supervision to assure proper installation, adjustment and performance

C. The installation of all vibration isolation units and associated hangers and bases shall be as directed by the vibration isolation manufacturer's representative.

D. It is the objective of this Specification to provide the necessary design for the control of excessive noise and vibration in the building due to the operation of machinery or equipment, and due to interconnected piping, ductwork or conduit

1. All vibration isolators shall have either known undeflected heights or calibration markings so that, after adjustment, when carrying their load, the deflection under load can be verified, thus determining that the load is within the proper range of the device and that the correct degree of vibration isolation is being provided according to the design.
2. All isolators shall operate in the linear portion of their load versus deflection curve. Load versus deflection curves shall be furnished by the manufacturer and must be linear over a deflection range of not less than 50 percent greater than the design deflection.
3. The theoretical vertical natural frequency for each support point, based upon load per isolator and isolator stiffness, shall not differ from the design objectives for the equipment as a whole by more than ±10 percent.
4. All neoprene mountings shall have a Shore hardness of 30 to 60 ±5, after minimum aging of 20 days or corresponding oven-aging.

E. Acoustical Testing

1. The contractor shall cooperate with regard to sound tests (ARI 575, ANSI S1.13) which may be conducted by Professional to verify that noise criteria are met.
2. The contractor shall notify the Professional of any changes which will affect the acoustical performance.

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Vibration isolation devices: catalog cuts, static deflections, quantity, load per isolator, mounting details, etc.	R	R		
Concrete and steel details for equipment pads				R
Weld or anchor bolt locations				R
Reinforcing and template steel locations and details				R
Inertia and equipment bases	R	R		R
Anchors, inserts and fasteners and fastening details	R	R		R
Flexible pipe connectors	R	R		R
Flexible duct connectors	R	R		R

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Vibration Isolation

1. Mason Industries, Inc.
2. Kinetics Noise Control, Inc.
3. M.L. Saussé & Co. (Vibrex)
4. Amber-Booth
5. Or equal.

2.2 VIBRATION ISOLATOR TYPES

A. Spring type

1. Spring isolators shall incorporate following

a. All springs to be single coil steel with minimum spring coil outer diameter 0.8 of loaded operating height
b. Horizontal spring stiffness within 0.8 to 1.25 times rated vertical spring stiffness
c. Corrosion resistance

(1) Where exposed to corrosive environment including but not limited to:

a) Outdoors
b) Exposed to outdoor air within 5 feet of outdoor air intake

(2) Corrosion protection: painted with outdoor paint
(3) Springs neoprene coated
(4) Hardware cadmium plated
(5) All other metal parts hot dip galvanized

d. Reserve deflection (from loaded to solid height) of 50 percent of rated deflection
e. Designed and installed so that ends of springs remain parallel; neoprene cups not acceptable
f. Noise pads of ½ inch or 1 inch thickness below the spring base to reduce the chance that the springs shall be resonant with equipment forcing frequencies or support structure natural frequencies. See Table in Paragraph 3.4B.
g. Leveling device
h. Where operating weight differs from installed weight provide built-in adjustable limit stops to prevent equipment rising when weight is removed. Stops shall not be in contact during normal operation.

2. Type "A": Similar to Mason Type SLF
3. Type "B": same as Type "A" except

a. Provide built-in resilient vertical limit stops

b. Tapped holes in top plate for bolting to equipment
c. Capable of supporting equipment at fixed elevation during equipment erection
d. Mason Type SLRS or equal for 1 inch and 2 inch deflection, Type SLR Series 100 for 3 inch to 5 inch deflection

4. Type "C": spring hanger rod isolators shall incorporate the following

a. Spring element seated on steel washer within neoprene cup
b. Steel retainer box encasing spring and neoprene cup
c. Minimum 1/2 inch clearance between retainer box and spring hanger rod
d. Minimum 15 degrees angular clearance between rod and retainer box
e. Double deflection neoprene element at top of hanger box
f. Mason 30N or equal

B. Elastomer mounting types

1. Type "D": Double deflecting type incorporating following

a. Bolt holes for bolting to equipment base
b. Bottom steel plates for bolting to sub-base as required
c. Unit type design molded in black oil-resistant neoprene
d. Neoprene compounded to meet following:

(1) Not greater than 50 durometer
(2) Minimum tensile strength 2000 pounds per square inch
(3) Minimum elongation 300 percent
(4) Maximum compression set of 25 percent of the original deflection

e. Mason Type ND or equal
f. Mason Type BR or equal

2. Type "E": Elastomer hanger rod isolators shall incorporate following

a. Molded unit type neoprene element
b. Compounding described in Type "D" above
c. Steel retainer box encasing neoprene mounting.
d. Minimum 1/2 inch box
e. Mason Type HD or equal

3. Type "F": pad type elastomer mountings to incorporate following

a. 5/16 to 3/8 inch minimum thickness per layer
b. 50 psi maximum loading
c. Ribbed or waffled design
d. 1/16 inch galvanized steel plate between multiple layers of pad thickness
e. 1/16 inch deflection per pad thickness
f. Suitable bearing plate to distribute load
g. Bolts through equipment and pad shall be oversized and provided with resilient washers, bushings and lock nuts
h. Mason Type W Series or equal

4. Type "G": Pad type elastomer mountings to incorporate following

a. High quality bridge bearing neoprene
b. Maximum loading 800 psi

c. Suitable bearing plate to distribute load
d. Minimum thickness 2 inch
e. Mason Type BBP or equal

5. Type "H": Combination spring/elastomer hanger rod isolators to incorporate following

a. Spring and neoprene isolator elements in steel box retainer
b. Characteristics of spring and neoprene as described in Type "C" and Type "E" hanger isolators
c. Factory preloading to 75 percent of rated load
d. Mason PC30N or equal

2.3 EQUIPMENT BASES

A. Integral structural steel bases, Type "B-1"

1. Reinforced as required to prevent base flexure at start-up and misalignment of drive and driven units
2. Fan bases complete with motor slide rails
3. Drilled for drive and driven unit mounting template
4. Mason Type WFSL or equal

B. Concrete inertia base, Type "B-2"

1. Formed in structural steel frame
2. Structural base reinforced as required to prevent flexure, misalignment of drive and driven unit or stress transferal into equipment
3. Minimum thickness of the inertia base shall be 6 inches or greater if required to meet weight ratio specified below
4. Fan bases complete with motor slide rails
5. Pump bases shall be large enough to support suction and discharge elbows and suction diffusers
6. Bases complete with

a. Height saving brackets
b. Reinforcing
c. Equipment bolting provisions
d. Isolators provided by vibration control supplier, type as scheduled

7. Base ready for concrete pour
8. Inertia Base Weights

a. Centrifugal Fans, except as noted: Minimum 1.0 times weight of fan, motor and drive
b. Air handling Units, except as noted: Minimum 1.0 times weight of fan and coil cabinet, coils, fan, motor and drive
c. Pumps: Minimum 1.5 times weight of pump, motor and base

(1) Base to be sized to support suction diffuser when used

d. Air compressors

(1) Minimum 2 times weight of compressor, motor and base
(2) Weight can be reduced by weight of tank when tank mounted unit is provided

9. Mason Type KSL/BMK or equal

2.4 ANCHORS, INSERTS AND FASTENERS

A. All anchors and inserts shall be installed according to the ICBO standards

B. Do not use any anchor or insert in concrete which does not have a signed structurally engineered design value based on its installed application and one of the following

1. ICBO evaluation report
2. Lab test report verifying compliance

C. Do not use powder driven and power driven (Shoot-In) fasteners, expansion nails or friction spring clips

D. All over-head concrete anchors or inserts shall be selected to comply with the ICBO report table for the anchor or insert

E. Torque testing of anchors shall be allowed to verify compliance of anchor installation. However, torque testing shall not justify usability of anchor. Only load or pull testing shall be allowed to justify usability of anchors. Failure of torque shall constitute failure of anchor.

F. Bolts and nuts

1. Bolts and heavy hexagon nuts: ANSI B18.2.1 and ASTM A307 or A576
2. Bolts, underground: ASTM A325
3. Expansion anchors: Federal Specification A-A-1922

2.5 FLEXIBLE PIPE CONNECTORS

A. Piping Connections for Vibration Isolation

1. Molded twin-sphere type connectors made of peroxide cured EPDM and Kevlar tire cord reinforcement
2. Connectors up to 2 inch diameter may have threaded ends
3. Connectors 2-1/2 inch diameter and larger to have floating steel flanges recessed to lock the connector's neoprene flanges
4. Connectors rated a minimum of 150 pounds per square inch at 220 degrees Fahrenheit without control rods or cables
5. Mason SAFEFLEX Type SFDEJ or equal

2.6 FLEXIBLE DUCT CONNECTORS

A. See Section 23 31 13 – Ducts

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install isolators in accordance with manufacturer's written instructions

B. Vibration isolators must not cause any change of position of equipment or piping resulting in piping stresses or misalignment

C. Make no rigid connections between equipment and building structure that degrade noise and vibration isolation system herein specified

1. Electrical conduit connections to isolated equipment shall be flexible liquid tight conduit of sufficient length to incorporate a right angle bend, an offset of not less than 8 inches or a loop to allow free motion of isolated equipment
2. The HVAC Sub-contractor shall not install any equipment, piping or conduit which makes rigid contact with the building unless permitted in this Specification; building includes, but is not limited to, slabs, beams, columns, studs and walls
3. Coordinate work with other trades to avoid rigid contact with the building. Inform other trades following work, such as plastering or electrical, to avoid any contact which would reduce the vibration isolation

D. Do not use isolator leveling bolts as jacking screws

E. Verify that all installed isolators and mounting systems permit equipment motion in all directions

3.2 FLOOR MOUNTED EQUIPMENT

A. Concrete housekeeping pads

1. Isolation supplier to determine dimensions and thickness required

a. Minimum thickness: 5.5 inches

2. Support all vibration isolation devices and bases
3. Key with stirrups as required, integral with structural slab

3.3 EQUIPMENT ISOLATION

A. General

1. Provide 1 inch operating clearance between equipment or structural bases and housekeeping pad

a. 1 inch minimum clearance for inertia bases over 96 inches in any dimension

2. Position equipment, structural base and concrete bases on blocks or wedges at proper operating height
3. Provide operating load conditions prior to transferring base isolator loads to springs and removing wedges
4. Adjust or provide additional resilient restraints to flexibly limit start-up equipment lateral motion to 1/4 inch
5. Prior to start-up, clean out all foreign matter between bases and equipment
6. Verify that there are no isolation short circuits in the base, isolators, or conduit, pipe and duct connections
7. Locate spring hanger boxes directly adjacent to the structural support element above, as opposed to down at the location of the supported equipment
8. Where isolator base pad is called for in Vibration Isolator Schedule, install pad between the

isolator base and structure

9. For isolator pads penetrated by anchors to the structure, to prevent short-circuiting, provide neoprene grommet between the anchor and isolator. Hand-tighten nut so that grommet is not compressed then secure with lock nut.

B. Vibration Isolator Schedule

Equipment	Base Type	Isolator Type	Isolater Static Deflection	Thickness
Floor-mounted Pumps				
10 HP and larger	B-2	A	2 inch	1 inch
5 HP to 7.5 HP	B-2	A	1.5 inch	1/2 inch
<5 HP	B-2	A	1 inch	1/2 inch–

3.4 PIPING AND DUCTWORK ISOLATION

A. See Section 23 21 12 – Heating and Cooling Piping and Section 23 31 13 – Ducts

B. Ductwork

1. No vibration isolation required

C. Piping other than risers

1. No vibration isolation required

D. Pipe Risers

1. For pipe risers less than 75 feet, vertical risers shall be laterally supported with a riser clamp at each floor set on a Type F isolation pad, ¼" deflection.
2. For pipe risers greater than 75 feet, riser supports shall be engineered by the vibration isolation vendor as follows

    a. All vertical risers shall be supported by spring isolators designed to support the riser filled with water. Assigned loads must be within the building design limits at the support points.
    b. Neutral central resilient anchors close to the center of the run shall direct movement up and down. The anchors shall be capable of holding an upward force equal to the water weight when the system is drained. If one level cannot accommodate this force, anchors can be located on 2 or 3 adjacent floors. Anchors shall be Mason ADA or equal.
    c. Resilient guides shall be spaced and sized properly depending on the pipe diameter. Guides shall be Mason VSG Vertical Sliding Guides or equal.
    d. Support spring mountings shall be Type A. The initial spring deflection shall be a minimum of 0.75 inches or four times the thermal movement at the isolator location, whichever is greater.
    e. Submittals must include the initial load, initial deflection, change in deflection, final load and change in load at all spring and anchor support locations, as well as guide spacing. Calculations shall include pipe stress at end conditions and branch off locations and the manufacturer must include installation instructions. Submittal must be stamped and signed by a licensed professional engineer in the employ of the vibration isolator vendor.

E. Wall and Floor Penetrations

1. All piping and ductwork to be vibration isolated, and all piping and ductwork passing through acoustically rated partitions, shall freely pass through walls and floors without rigid contacts or connections. Penetration points shall be sleeved or otherwise formed to allow passage of piping or ductwork, and maintain 0.75 inches to 1.25 inches clearance around the pipe or duct outside surfaces.

    a. For installations through air plenum partitions and through acoustically rated partitions, clearance space shall be tightly packed with fiberglass, and caulked airtight after installation of piping or ductwork
    b. For installation in rated walls, see Section 23 21 12 – Heating and Cooling Piping and Section 23 31 13 – Ducts

2. Provide sleeves and escutcheons as specified in Section 23 21 12 – Heating and Cooling Piping and Section 23 31 13 – Ducts.

3.5 FIELD QUALITY CONTROL

A. Inspection by manufacturer's representative of all vibration isolating devices

1. After installation of all devices
2. Provide written report by manufacturer regarding

    a. Installation errors
    b. Improper selection of devices
    c. Other fault that could affect performance of system

B. Submit written report to Professional

1. Include manufacturer's report indicating required corrections
2. Include report on steps to properly complete isolation work

C. See Section 23 08 00 – Mechanical Commissioning

END OF SECTION 23 05 48

SECTION 23 05 53 – MECHANICAL SYSTEM IDENTIFICATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. This Section includes the following mechanical identification materials and their installation:

1. Equipment nameplates.
2. Equipment markers.
3. Equipment signs.
4. Access panel and door markers.
5. Pipe markers.
6. Duct markers.
7. Valve tags.
8. Valve schedules.
9. Warning tags.

B. Related Sections

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. Pipe marker shall comply with ANSI A13-1

1.4 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing

Item	Product Data	O&M Manual	Samples	Shop Drawing
Pipe markers	R		R	
Duct markers	R		R	
Equipment tags	R		R	
Valve tags	R		R	
Concealed equipment markers	R		R	

C. Samples: For color, letter style, and graphic representation required for each identification material and device.

D. Valve numbering scheme.

E. Valves Schedules: For each piping system. Furnish extra copies (in addition to mounted copies) to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. ASME Compliance: Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

1.6 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with location of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. W.H. Brady

C. Seton

D. Marking Systems, Inc. (MSI)

E. Or equal

2.2 EQUIPMENT IDENTIFICATION DEVICES

A. Equipment Nameplates: Metal, with data engraved or stamped, for permanent attachment on equipment.

1. Data:

a. Manufacturer, product name, model number, and serial number.
b. Capacity, operating and power characteristics, and essential data.
c. Labels of tested compliances.

2. Location: Accessible and visible.
3. Fasteners: As required to mount on equipment.

B. Equipment Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.

1. Data: Instructions for operation of equipment and for safety procedures.
2. Engraving: Manufacturer's standard letter style, of sizes and with terms to match equipment identification.
3. Thickness: 1/8 inch, unless otherwise indicated.
4. Thickness: 1/16 inch for units up to 20 sq. in. or 8 inches in length, and 1/8 inch for larger units.
5. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

C. Access Panel and Door Markers: 1/16-inch thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8-inch center hole for attachment.

1. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.3 PIPING IDENTIFICATION DEVICES

A. Manufactured Pipe Markers, General: Preprinted, color-coded, with lettering indicating service, and showing direction of flow.

1. Colors: Comply with ASME A13.1, unless otherwise indicated.
2. Lettering: Use piping system terms indicated and abbreviate only as necessary for each application length.
3. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers extending 360 degrees around pipe at each location.
4. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or shaped pipe markers at least three times letter height and of length required for label.
5. Arrows: Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

B. Pretensioned Pipe Markers: Precoiled semirigid plastic formed to cover full circumference of pipe and to attach to pipe without adhesive.

C. Shaped Pipe Markers: Preformed semirigid plastic formed to partially cover circumference of pipe and to attach to pipe with mechanical fasteners that do not penetrate insulation vapor barrier.

D. Background Color

Service	Pipe marker	Background color	Lettering
Chilled water	Chilled water supply	Green	Black
	Chilled water return	Green	Black
Heating water	Heating water supply	Yellow	Black
	Heating water return	Yellow	Black
Cold water	Domestic cold water	Green	Black
Hot water	Domestic hot water supply	Yellow	Black
	Domestic hot water return	Yellow	Black
Sprinkler water	Fire protection water	Red	Black
Air, instrument	Instrument air	Green	Black
Sanitary waste	Sanitary waste	Green	Black
Storm drain	Storm drain	Green	Black
Overflow drain	Overflow drain	Green	Black
Vent	Vent	Green	Black
Heat recovery water	Heat recovery supply	Yellow	Black
	Heat recovery return	Yellow	Black
Process grey water	Process grey water	Green	Black
Emergency eyewash and shower	Emergency shower	Yellow	Black
Refrigerant Suction/Gas	Refrigerant Suction/Gas	Yellow	Black
Refrigerant Liquid	Refrigerant Liquid	Yellow	Black
Natural gas	Natural gas	Yellow	Black

2.4 DUCT IDENTIFICATION DEVICES

A. Duct Markers: Engraved, color-coded laminated plastic. Include direction and quantity of airflow and duct service (such as supply, return, and exhaust). Include contact-type, permanent adhesive.

2.5 VALVE IDENTIFICATION

A. Valve Tags: Numbering scheme approved by Professional

1. General: Identify valves with metal tags, legends to be stamped or embossed. It shall indicate the function of the valve and its normal operating position; such as:

   a. “56 HW” (NUMBER AND CONTENT OF PIPE)
   b. “ISOLATION” (VALVE FUNCTION)
   c. “NO” (NORMAL OPERATION POSITION)

2. Not required at isolation valves located adjacent to equipment they isolate.
3. Size: Valve tags 2-inch diameter with 1/4-inch high letters for piping system abbreviation and 1/2-inch numbers with numbering scheme approved by Professional.
4. Material: Use 0.050 or 0.064-inch brass tags
5. Automatic Valves and Regulating Valves: Use 1/16-inch thick laminated 3-ply plastic, center ply white, outer ply red, “lamicoid” or equal. Form letters by exposing center ply
6. Valve Tag Directory: Include tag number, location, exposed or concealed, service, valve size, valve manufacturer, valve model number, tag material, and normal operating position of valve
7. Medical Gas Zone Valves (Regulatory Identifier): See attached sample, confirm with

Using Agency and Professional.

a. Acrylic: 3.00” h x 7.00” w x 0.125” non-glare, reversed lettered, backpainted
b. Actual Outside Dimensions: 3.00 “ x 7.00”
c. Text:

1) Tactile: 0.375” Futura Medium, First Letter Capital, Centered, 0.25” between lines of text

d. Colors:

1) UMS Blue: Tactile Plate
2) White: Text

e. Installation: Signage company to install. Mount with double-sided adhesive tape and silastic adhesive or mechanically secure with 3/16” x 1” nylon anchors.

2.6 VALVE SCHEDULES

A. Valve Schedules: For each piping system, on plastic laminated, standard-size bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.

1. Valve-Schedule Frames: Glazed display frame for removable mounting on masonry walls for each page of valve schedule. Include mounting screws.
2. Frame: Extruded aluminum.
3. Glazing: ASTM C 1036, Type I, Class 1, Glazing Quality B, 2.5-mm, single-thickness glass.

2.7 WARNING TAGS

A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags; of plasticized card stock with matte finish suitable for writing.

1. Size: Approximately 4 by 7 inches.
2. Fasteners: Brass grommet and wire.
3. Nomenclature: Large-size primary caption such as DANGER, CAUTION, or DO NOT OPERATE.
4. Color: Yellow background with black lettering.

2.8 EQUIPMENT LOCATOR TACKS

A. 7/8" diameter tack for pushing into ceiling tile near closest equipment access point. Colors to be as specified.

PART 3 - EXECUTION

3.1 HVAC EQUIPMENT IDENTIFICATION

A. Install and permanently fasten equipment nameplates on each major item of mechanical

equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible. Include nameplates for the following general categories of equipment:

1. Fuel-burning units, including boilers, makeup air units, and domestic water heaters.
2. Pumps, chillers, condensing units, cooling towers and similar motor-driven units.
3. Coils, evaporators, tanks, and similar equipment.
4. Fans, blowers, primary balancing dampers, and VAV terminal units.
5. Packaged HVAC central-station and zone-type units, including modular air handling units, ductless split-system units, unit heaters, etc.
6. Tanks, large piping specialties (expansion tanks and air separators).

B. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.

1. Identify mechanical equipment with equipment markers in the following color codes:

   a. Blue: For cooling equipment and components.
   b. Orange: For heating equipment and components.
   c. Green: For combination cooling and heating equipment and components.
   d. Brown: For energy-reclamation equipment and components.

2. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

3. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.

4. Include signs for the following general categories of equipment:

   a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
   b. Meters, gages, thermometers, and similar units.
   c. Fuel burning units including boilers, gas-fired makeup air units, domestic water heaters.
   d. Pumps, chillers, condensing units, and similar motor-driven units.
   e. Heat exchangers, coils, evaporators, and similar equipment.
   f. Fans, blowers, primary balancing dampers, and control dampers.
   g. Packaged HVAC central-station units, including modular air handling units, ductless split system heat pumps, terminal units, unit heaters, etc.
   h. Tanks and pressure vessels.
   i. Strainers, filters, water-treatment systems, and similar equipment.
   j. Starters, variable frequency drives, contactor, push-button station, control switch, disconnect and thermal overload switch

C. Install access panel markers with screws on equipment access panels.

3.2 PIPING IDENTIFICATION

A. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

1. Pipes with OD, Including Insulation, Less Than 6 Inches: Pretensioned pipe markers. Use size to ensure a tight fit.

B. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior nonconcealed locations as follows:

1. Within 18” of each valve, valve assembly and control device.
2. Within 3’ of each 90 degree elbow, connection to equipment or vessel and where pipe enters shafts and penetrates outside walls, floors, ceilings and nonaccessible enclosures.
3. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
4. At access doors, manholes, and similar access points that permit view of concealed piping.
5. Near major equipment items and other points of origination and termination.
6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 20 feet in areas of congested piping and equipment.
7. On piping above removable acoustical ceilings (maximum of 20 feet). Omit intermediately spaced markers.

3.3 HVAC DUCT IDENTIFICATION

A. Install duct markers with permanent adhesive on air ducts in the following color codes:

1. Green: For cold-air supply ducts.
2. Yellow: For hot-air supply ducts.
3. Blue: For exhaust-, outside-, relief-, return-, and mixed-air ducts.
4. ASME A13.1 Colors and Designs: For hazardous material exhaust.
5. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

B. Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 25 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.4 VALVE-TAG INSTALLATION

A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; plumbing fixture supply stops; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following:

1. Valve-Tag Size and Shape:

a. Domestic and Hydronic Cold Water: 1-1/2 inches round.
b. Domestic and Hydronic Hot Water: 1-1/2 inches round.
c. Refrigerant: 1-1/2 inches round.
d. Fire Suppression Water: 1-1/2 inches round.

2. Valve-Tag Color:

    a. Domestic and Hydronic Cold Water: Blue
    b. Domestic and Hydronic Hot Water: Yellow
    c. Refrigerant: Green
    d. Fire Suppression Water: Red

3. Letter Color:

    a. Domestic and Hydronic Cold Water: Black
    b. Domestic and Hydronic Hot Water: Black
    c. Refrigerant: White
    d. Fire Suppression Water: White

3.5 VALVE-SCHEDULE INSTALLATION

A. Mount valve schedule on wall in accessible location in each major equipment room.

3.6 WARNING-TAG INSTALLATION

A. Write required message on, and attach warning tags to, equipment and other items where required.

3.7 EQUIPMENT LOCATOR TACKS

A. Install tacks into the ceiling tile or insulation at the closest access point to the device.

B. Install tacks to locate above ceiling equipment and devices as follows:

1. Fire dampers (red)
2. Manual volume dampers (orange)
3. Motorized control dampers (yellow)
4. HVAC equipment (black)
5. Hydronic system valves (green)
6. Control system devices (light blue)
7. Cold water (blue)
8. Hot water (red)

3.8 ADJUSTING

A. Relocate mechanical identification materials and devices that have become visually blocked by other work.

3.9 CLEANING

A. Clean faces of mechanical identification devices and glass frames of valve schedules.

END OF SECTION 23 05 53

SECTION 23 05 93 – TESTING, ADJUSTING AND BALANCING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. The Testing, Adjusting, and Balancing (TAB) Agency shall be hired by the Commissioning Authority directly, under a separate contract with the Using Agency. This Section is provided to establish the TAB scope of work and provide information to enable the Contractor to schedule TAB activities with all other trades.

B. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Operational testing and adjusting of air handling equipment
2. Balancing of air distribution systems
3. Adjustment of air terminal devices
4. Flow testing, adjusting and balancing of hydronic systems.

C. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods
4. Section 23 31 13 – Ducts
5. Section 23 08 00 – Mechanical Commissioning
6. Section 23 09 00 – Energy Management & Control Systems

1.3 REFERENCE STANDARDS

A. National Environmental Balancing Bureau Procedural Standards

B. Associated Air Balance Council National Standards

C. ASHRAE Standard 111 Practices for Measurement, Testing, Adjusting, and Balancing of Building Heating, Ventilating, and Air-Conditioning Systems

1.4 QUALITY ASSURANCE

A. Agency shall be member of Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB)

B. Agency shall have satisfactorily balanced at least three systems of comparable type and size

C. Prior to start of testing, adjusting and balancing, verify that required Project conditions are met

1. Systems installation is complete and in full operation
2. All pre-functional tests have been performed
3. Equipment has been started and tested in accordance with manufacturers written installation instructions
4. Doors and windows are in place or under normal traffic conditions

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
AABC, NEBB or TABB certification	R			
Report forms	R			
List of instrumentation	R			
Final air balancing report		R		
Final water balancing report		R		

C. Submit to Professional documentation that

1. Agency is a member of Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB).
2. Agency has satisfactorily balanced at least three systems of comparable type and size

a. Include list of such projects
b. Include sample forms for use in compiling and recording test and balance data

D. Pre-Test Submittal

1. At least 15 days prior to starting field work, submit paper copies of the following

a. Set of final report forms

(1) Complete with design conditions of all equipment and design flow rates for all equipment and devices to be balanced.
(2) Forms shall include blank entry space for all data requested in this Section. Carefully review requested data; standard balancing forms may not be acceptable.

(3) Verify that forms are in acceptable word-searchable electronic format per Section 23 05 00 – Basic Mechanical Materials and Methods.

b. Complete list of instruments proposed to be used

(1) Organize in appropriate categories
(2) Include data sheets for each
(3) Show

a) Manufacturer and model number
b) Description and use when needed to further identify instrument
c) Size or capacity range
d) Latest calibration date

c. Provide certification that

(1) All instruments have been calibrated prior to tests
(2) Instruments comply with requirements of AABC or NEBB for tests required
(3) Agency is currently certified by AABC or NEBB

2. Do not proceed with field work until the above submittal has been approved by Professional.

E. Final Test & Balance Report

1. At least 15 days prior to Contractor's request for final inspection, submit three paper copies of final reports on approved reporting forms for review and approval by Professional. Once approved, provide required quantity of paper and electronic copies per 23 00 10 – Mechanical General Provisions.

2. Form of Final Reports

a. Fully completed report forms for all systems specified to be tested and balanced including at a minimum all data specified herein to be recorded
b. Each individual final reporting form must bear

(1) Signature of person who recorded data
(2) Signature of air balance supervisor of reporting organization

c. When more than one certified organization performs total air balance services, firm having managerial responsibility shall make submittals.
d. Identify instruments of all types that were used and last date of calibration of each.

1.6 PROJECT REVIEW

A. Pre-Construction Review

1. Review following documents

a. Contract documents

(1) Drawings
(2) Specifications
(3) Addenda
(4) Change orders

b. Design intent documents
c. Submittal data
d. Shop drawings
e. Temperature control drawings
f. Pre-functional test reports

2. Assure that design intent and all sequences of operation are clearly understood.
3. Identify potential problems from standpoint of total system balance.
4. Review of specifications for

a. Scope of work
b. Special requirements
c. Items that will make balancing difficult or impossible

5. Review of Drawings for

a. Potential problems for total system balance

(1) Location of balancing devices
(2) Lack of balancing devices
(3) General System layout
(4) Architectural features
(5) Accessibility

b. Most effective system balance procedures
c. Scheduling and coordination requirements

6. Review of submittal data for

a. Completeness of data
b. Conformity with contract documents
c. Special instructions for use of balancing devices
d. Factors for flow meters
e. Limitations affecting accuracy of measurements
f. Balancing forms shall show design data and submittal data where different
g. Equipment performance data and curves

7. Review of shop drawings for potential problems for total system balance, as specified above for review of the contract Drawings.

8. Review of temperature control drawings for:

a. Thorough understanding of system functions
b. Determining most effective total system balance procedure for minimum control manipulation
c. Coordinate required control manipulation with EMCS installer

9. Submit report recommending addition and/or relocation of balancing devices, including, but not limited to

a. Volume dampers
b. Balancing valves
c. Flow metering devices, for air and water
d. Pressure and temperature measuring points

B. Construction Review

1. Make on-site visits during progress of construction: Number of visits to be as required to perform the functions specified below.
2. Purpose of review

a. Identify potential problem for performing total system balance
b. Identify modifications that will affect air total system balance
c. Schedule and coordinate total system balance with other work
d. Identify conditions that could create hazardous environment for building occupants

3. Typical activities

a. Check that necessary balancing and measuring hardware is

(1) In place
(2) Located properly and accessibly
(3) Installed correctly

b. Identify and evaluate variations from system design
c. Record data from equipment nameplates
d. Identify and report possible restrictions in systems; such as

(1) Closed fire dampers
(2) Long runs of flexible duct
(3) Poorly designed duct fittings
(4) Questionable piping connections
(5) Others as may arise or based on Agency's experience

e. Verify that construction progress will not delay total system balance
f. Identify best location for duct Pitot tube traverses
g. Identify scaffolding needs

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified herein. If not otherwise noted, the following minimum requirements apply

1. Volt-meter: plus or minus 1 percent scale
2. Ammeter: plus or minus 1 percent scale
3. Ohmmeter: plus or minus 0.1 percent scale for calibrating plus or minus 0.4 degrees Fahrenheit resistance temperature sensors, plus or minus 0.25 percent scale for calibrating plus or minus 1 degrees Fahrenheit temperature sensors, plus or minus 1 percent scale for measuring motor current
4. Ultrasonic time-of-travel strap-on flow sensor: plus or minus 5 percent of reading
5. Other flow sensors: plus or minus 2 percent of reading
6. Water pressure gauge: plus or minus1/2 percent scale, ASME Grade 2A
7. Watt meter, plus or minus1/2 percent scale: 3 phase split core current transducers
8. Temperature: plus or minus 0.4 degrees Fahrenheit

B. All equipment shall be calibrated within 6 months of use, or according to the manufacturer's recommended interval, whichever is shorter, and when dropped or damaged. Calibration tags shall be affixed or certificates readily available and proof of calibration shall be included reports.

PART 3 - EXECUTION

3.1 GENERAL

A. Coordinate with work of other trades.

B. Coordinate all work with Commissioning Coordinator

1. See Section 01 91 00 – Commissioning
2. See Section 23 08 00 – Mechanical Commissioning

C. Report to Professional any discrepancies or items not installed in accordance with the Contract Drawings pertaining to proper balance and operation of air and water distribution systems.

D. Perform testing, adjusting and balancing in accordance with AABC or NEBB standards.

E. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to Section 23 07 00 – Mechanical Insulation.

F. Mark equipment settings with paint or other suitable, permanent identification material, including damper control positions, valve indicators, and similar controls and devices, to show final settings.

3.2 CONTROL SYSTEM COORDINATION

A. See Section 23 09 00 – Energy Management & Control Systems (EMCS)

B. System balance techniques in this Section rely on the operation of the EMCS. Test and balance agency shall coordinate schedule of work with EMCS installer to ensure test and balance work can be executed and completed in a timely manner.

C. Cooperate with EMCS installer in determining operating conditions and setpoints, as indicated in this Section.

D. Cooperate with EMCS installer in calibrating all airflow measuring devices.

E. Obtain and receive training for required software from controls system vendor for setting calibration constants in terminal devices.

3.3 WATER SYSTEMS BALANCING

A. Prepare water systems for balancing in following manner

1. Verify the following conditions

a. Piping systems have been flushed and treated in accordance with Section 23 21 13 – Heating and Cooling Piping
b. Strainers have been cleaned
c. Insides of traps, reducing and regulating valves have been cleaned
d. Expansion tanks are not air bound
e. Piping systems are completely full of water, all air properly vented
f. All coil and heat exchanger isolation shut-off and balance valves are fully open

2. Check pump:

a. Rotation
b. Pump factory impeller trimming by comparing shut-off heads with pump curves from approved submittals

(1) Note that impellers on variable speed pumps should not be trimmed to design flow and head conditions. See 23 21 23 – Pumps.
(2) Report discrepancy in shut-off head to Professional and if impeller does not appear to be properly trimmed, wait for direction before proceeding with pump test and balance.

3. EMCS and Central Plant Operability

a. Do not proceed with any of the following balancing procedures until the EMCS is capable of operating equipment such as fans, pumps, VAV boxes, control valves, and the like, in manual and automatic modes and capable of reading sensors such as differential pressure, flow rates, temperatures, and the like, of air and hydronic systems to be tested and adjusted.
b. Do not proceed with air handler and fan-coil testing until chilled and hot water at design temperatures are available from the central plant.

B. Pumps

1. Test and report for each pump

a. Tag
b. Manufacturer and model of pump and motor
c. Motor horse power, volts, phase, full load amps
d. Pump shut-off head from curves and measured shut-off head
e. With all control valves open to coils, variable speed drive (where installed) at 60 hertz, and parallel pumps all operating (where applicable)

(1) Volts and amps, measured with handheld meter, and calculated brake horsepower
(2) Amps and kilowatts, from EMCS/variable speed drive
(3) Entering and leaving gage pressure and difference in feet
(4) Flow rate deduced from pump curve
(5) Flow meter reading from EMCS

C. Hot Water System

1. The system is self-balancing via the controls. Two-way control valves at coils prevent each coil from being over-supplied with water, other than minor excursions during transients such as cool-down or warm-up. Conventional balancing (throttling of balancing valves) is not required nor desired. Do not adjust any valves on any coil or pump, except where specifically noted herein.

2. Balancing

    a. No balance is required at 2-way valves. Leave isolation shut-off valves full open.
    b. At 3-way valves, adjust balance valve in bypass leg as required to make pressure drop across the coil-valve assembly when valve is in full-bypass position equal to that when valve is in through-coil position. (Not required on coils with less than 1 foot pressure drop.) Leave isolation shut-off valves full open.
    c. Run pumps with all heating coil valves open. Balance flow through boilers to be equal .
    d. Report

        (1) Reheat Coils

            a) Tags of HW coils with 3-way valves that are balanced
            b) Pressure drop across the assembly with valve open to coil
            c) Pressure drop across the assembly with valve open to bypass before and after bypass valve balance

        (2) See Air Balance below for reheat coil temperature data

3. Test control valve shut-off

    a. See Section 23 09 00 – Energy Management & Controls Systems and coordinate with EMCS installer.
    b. Close all control valves in the system via the EMCS. Close bypass balance valves of 3-way valves. Run all HW pumps at full speed, dead-headed

        (1) Verify that all control valves remain shut with no measurable flow, as indicated by pump differential pressure, boiler flow , and any temperature rise across coils. See Section 23 09 00– Energy Management & Controls Systems.
        (2) Do not run pumps deadheaded for more than 5-minutes at any one time.
        (3) After test, return 3-way valve balance valves to prior position.

    c. Report: Provide a report separate form for this work for each pumping system and include as a minimum the following as measured under the control valve shut-off condition described above

        (1) Tag of coils where flow is detected: Initials of EMCS installer to indicate that this information was transmitted to them.
        (2) Measured pump inlet and outlet pressures, and difference converted to feet.

D. Variable flow pumping systems with variable speed drives

1. Applies to

    a. Chilled water system
    b. Hot water system

2. System is variable flow with variable speed drives: The system is self-balancing via the controls. Two-way control valves at coils prevent each coil from being over-supplied with water, other than minor excursions during transients such as cool-down or warm-up, and the flow meter at the building connection to the central plant will be used to limit over-pumping of primary water from the central plant. Conventional balancing (throttling of balancing valves) will increase pump energy use by not allowing aggressive differential pressure setpoint reset. Hence, do not adjust any valves on any coil or pump, except temporary adjustments where noted. All manual valves at coils and pumps shall be wide open when test and balance work

is complete.

3. Determine differential pressure setpoint in conjunction with the EMCS installer as follows. (All adjustments made via the EMCS, not field measurements except as noted.)

    a. Fully open all chilled water control valves serving coils that are located downstream of the differential pressure sensor.
    b. Fully close all chilled water control valves serving coils that are located upstream of the differential pressure sensor.
    c. Start one of the building loop chilled water pumps. Manually adjust speed slowly until design flow (or design pressure drop, for coils without calibrated balance valves) is just achieved through all open coils without modulating any balance valves: One coil should be just at design flow, while others should be at or above design flow by no more than 20 percent. If flow is over 20 percent of design rate, temporarily throttle flow to coil with shut-off valve as required to reduce rate to design. Fully open shut-off valve after procedure is complete.
    d. Once flow condition in previous step is achieved, note the EMCS system differential pressure reading at the differential pressure sensor. This reading becomes the differential pressure setpoint: Using pressure taps at differential pressure sensor and handheld digital pressure sensor, verify accuracy of EMCS reading.
    e. If there are multiple differential pressure sensors, repeat steps above for each sensor and use largest as differential pressure setpoint.
    f. Convey to the EMCS installer

        (1) Differential pressure setpoint
        (2) Any discrepancy between EMCS differential pressure reading and handheld measurement

    g. Test Report: Provide a separate form for each pumping system and include as a minimum the following

        (1) Differential pressure setpoint and concurrent reading of handheld measurement: Initials of EMCS installer to indicate that the information was transmitted to them.
        (2) Tag of coils downstream of differential pressure sensor, along with the following for each

            a) Design flow rate and pressure drop
            b) Tested flow rate and pressure drop with differential pressure at setpoint determined above
            c) Note if any shut-off valves at coils were required to be throttled in order to prevent excess flow, and initials of balancer that valves were returned to full open position after tests are complete

        (3) Concurrent pump data

            a) Amps and kilowatts, from EMCS
            b) Variable speed drive speed in hertz
            c) Entering and leaving gage pressure and difference in feet
            d) Flow rate deduced from pump curve
            e) Flow rate reading from EMCS

4. Test control valve shut-off

    a. Close all control valves in the system. Close bypass balance valves of 3-way valves. Run all pumps (except stand-by pumps, if any) at full speed, dead-headed

(1) Verify that all control valves remain shut with no measurable flow, as indicated by pump differential pressure and any temperature rise across coils.
(2) Do not run pumps deadheaded for more than 5-minutes at any one time.
(3) After test, return 3-way valve balance valves to prior position.

b. Report: Provide a report separate form for this work for each pumping system and include as a minimum the following as measured under the control valve shut-off condition described above

(1) Tag of coils where flow is detected: Initials of EMCS installer to indicate that this information was transmitted to them.
(2) Measured pump inlet and outlet pressures, and difference converted to feet
(3) Differential pressure reading at all differential pressure sensors, through EMCS
(4) Water flow rate from flow meter, through EMCS

E. Bypass balance at 3-way valves

1. At all 3-way valves serving coils with a design coil pressure drop exceeding 2 feet, adjust balance valve in bypass leg as required to make pressure drop across the coil-valve assembly when valve is in full-bypass position equal to that when control valve is in through-coil position.

2. Record and Report

a. Mark setting on bypass balancing valve
b. The following shall be included as part of air-handler/fan-coil test form

(1) Differential pressure across coil-valve assembly when control valve is in full-bypass position
(2) Differential pressure across coil-valve assembly when control valve is in through-coil position

F. Chilled Water System

1. System is variable flow with variable speed drives: The system is self-balancing via the controls. Conventional balancing (throttling of balancing valves) will increase pump energy use by not allowing aggressive differential pressure setpoint reset. Hence, do not adjust any valves on any coil or pump, except temporary adjustments where noted. All manual valves at coils and pumps shall be wide open when test and balance work is complete unless otherwise indicated.
2. Balance

a. Coils with two-way pressure dependent (standard) control valves:

(1) No balance is required. Leave all shut-off and balancing valves full open.

b. Coils with two-way pressure independent control valves:

(1) No balance is required. Leave all shut-off and balancing valves full open.
(2) Verify that model number matches coil design flow rate from equipment schedule.

a) Where adjustment is required to achieve ½ gpm increments, adjust maximum setting per manufacturer's charts.

c. Test and record

(1) Coils with two-way pressure dependent (standard) control valves:

a) Terminal tag
b) Control valve model number and serial number
c) Pressure drop across the coil with valve open to coil

(2) Coils with two-way pressure independent control valves:

a) Terminal tag
b) Control valve model number and serial number
c) Pressure drop across the coil with valve open to coil
d) Maximum valve position adjustment

(3) See Air Balance below for coil temperature data

3. Determine differential pressure setpoint in conjunction with the EMCS Contractor as follows. (All adjustments made via the EMCS, not field measurements except as noted.):

a. Fully open all control valves serving coils that are located downstream of the differential pressure sensor.
b. Fully close all control valves serving coils that are located upstream of the differential pressure sensor.
c. Start one of the chilled water pumps. Manually adjust speed slowly until design flow (or design pressure drop, for coils without calibrated balance valves) is just achieved through all open coils without modulating any balance valves:

(1) One coil should be just at design flow, while others should be at or above design flow by no more than 20 percent. If flow is over 20 percent of design rate, temporarily throttle flow to coil with shut-off valve as required to reduce rate to design. Fully open shut-off valve after procedure is complete.

d. Once flow condition in previous step is achieved, note the EMCS system differential pressure reading at the differential pressure sensor. This reading becomes the differential pressure setpoint:

(1) Using pressure taps at differential pressure sensor and handheld digital pressure sensor, verify accuracy of EMCS reading.

e. If there are multiple differential pressure sensors, repeat steps above for each sensor; each will have a different setpoint.
f. Convey to the EMCS contractor:

(1) Differential pressure setpoint
(2) Any discrepancy between EMCS differential pressure reading and handheld measurement

g. Test Report: Provide a separate form for each pumping system and include as a minimum the following:

(1) Differential pressure setpoint and concurrent reading of handheld measurement:

a) Initials of EMCS contractor to indicate that the information was transmitted to them.

(2) Tag of coils downstream of differential pressure sensor, along with the following for each:

a) Design flow rate and pressure drop.
b) Tested flow rate and pressure drop with differential pressure at setpoint determined above.
c) Note if any shut-off valves at coils were required to be throttled in order to prevent excess flow, and initials of balancer that valves were returned to full open position after tests are complete.

(3) Concurrent pump data:

a) Amps and kilowatts, from EMCS.
b) Variable speed drive speed in hertz.
c) Entering and leaving gage pressure and difference in feet.
d) Flow rate deduced from pump curve.
e) Flow rate reading from EMCS flow meter.

4. Test control valve shut-off:

a. Close all control valves in the system through the EMCS. Run all pumps at full speed, dead-headed:

(1) Verify that all control valves remain shut with no measurable flow, as indicated by pump differential pressure, flow meters, and any temperature rise across coils. See Section 23 09 00.
(2) Do not run pumps deadheaded for more than 5-minutes at any one time.

b. Report: Provide a report separate form for this work for each pumping system and include as a minimum the following as measured under the control valve shut-off condition described above:

(1) Tag of coils where flow is detected:

a) Initials of EMCS contractor to indicate that this information was transmitted to them.

(2) Measured pump inlet and outlet pressures, and difference converted to feet.
(3) Differential pressure reading at all differential pressure sensors, through EMCS.
(4) Water flow rate from flow meter, through EMCS.

3.4 AIR SYSTEM BALANCING

A. General

1. Do not operate fan systems for test or balance until spaces served have been cleaned of dust and debris, to avoid contamination of supply air or return air paths and equipment.
2. Check that filters are installed, free of bypass, and clean; type as specified herein

a. Make allowance for air filter resistance at time of tests

(1) Pressure drop across filter banks midway between drop for clean and dirty filters at design airflow

b. For systems with construction prefilters and high efficiency final filters

(1) Perform all zone level balancing with only pre-filter installed, no final filter, and system operating on 100 percent outdoor air.
(2) Immediately prior to occupancy replace prefilters with new clean filters and install final filters. With final filters in place, perform tests of air handling unit per Paragraph 3.4D.

3. In cooperation with EMCS installer, set adjustments of automatically operated dampers and valves to operate as indicated.
4. Balance hydronic systems prior to air balance and have operational during air balance for air temperature measurements.

B. Air Outlets

1. Adjust diffusers' throw pattern, grilles and registers to pattern indicated on the Drawings.
2. Test and adjust each diffuser, grille and register to within plus or minus 10 percent of design requirements

a. Start with all dampers wide open.
b. Adjust dampers, starting with nearest to terminal unit or fan. Make adjustments using duct mounted volume dampers rather than dampers at diffuser face unless absolutely required.
c. At least one damper shall remain wide open at end of balance.

3. Plenum return air grilles or slots in lights: No balance required
4. Read and Report

a. Tag each grille, diffuser and register and mark tag on copy of floor plan.
b. For each grille, diffuser and register, indicate tag, size, type, and effective area (where applicable).
c. Required velocity/cubic feet per minute
d. Initially tested velocity/cubic feet per minute
e. Finally tested cubic feet per minute after adjustments

C. Terminal Boxes

1. Balancing Agency shall provide laptop computer or other device for communicating with EMCS system, using software provided by EMCS installer. Cooperate with EMCS installer to learn how to use software to calibrate EMCS zone controller.
2. Terminal box calibration procedure listed below may be modified based on specific features or limitations of digital controller and recommendations of the controller manufacturer. Submit revised procedure for approval by Professional along with pre-test submittal per Paragraph 1.4C.
3. Calibration at maximum volume setpoints

a. Zero transmitter prior to each test.
b. Adjust EMCS calibration constants so that actual box and measured air flow rate at air outlets matches EMCS reading within 5 percent at

(1) Maximum cooling airflow rate
(2) Maximum heating airflow rate

4. Calibration at minimum volume setpoint

a. Test flow at minimum volume setpoint. If EMCS indicated flow deviates from measured air flow rate at air outlets by more than 10 percent

(1) Calibrate EMCS again if a second calibration point is available
(2) If EMCS can only calibrate to one point, adjust EMCS minimum volume setpoint so that measured air flow rate at air outlets equals desired minimum, even though this will cause EMCS to read improperly

5. Terminal fans (fan-powered boxes)

a. Adjust speed to achieve design cfm within 10 percent
b. For series-flow boxes, adjust EMCS setpoint to allow VAV damper to operate at maximum airflow rate: Increase fan speed until there is no backflow through plenum opening.

6. Read and Report

a. Tag, manufacturer, and model
b. VAV maximum cooling flow rate, design and measured
c. VAV minimum flow rate, design and measured
d. VAV maximum heating flow rate, design and measured
e. EMCS calibration coefficients
f. Entering and leaving terminal static pressure at maximum cooling airflow
g. Entering and leaving terminal total pressure at maximum cooling airflow
h. Terminals with reheat coils, with HW valve wide, include also

(1) Entering air drybulb temperature to reheat coil
(2) Leaving air drybulb temperature from reheat coil
(3) Entering HW temperature to reheat coil
(4) Leaving HW temperature from reheat coil

D. Air Handling Unit and Fan-coil Airflow Rate Readings

1. Total supply air quantities shall be determined at all of the following where applicable:

a. Pitot traverse in the supply duct downstream, positive pressure side of the fan
b. Pitot traverse at coil or filter bank
c. Totaling the readings of individual air outlets
d. Totaling the readings of individual terminals as read through the EMCS
e. Supply fan airflow sensor reading as read through the EMCS

2. Total return air quantities shall be determined at all of the following where applicable:

a. Pitot traverse in the return air duct or damper entering air handler
b. Totaling the readings of individual air outlets, if ducted return system
c. Totaling reading of each return air shaft inlet, if multi-story plenum return system
d. Return fan airflow sensor reading as read through the EMCS

3. Outside air quantities shall be determined by all of the following where applicable:

a. Subtracting pitot traverses of supply and return ducts
b. Pitot traverse of outdoor air intake duct
c. Outdoor airflow sensor reading as read through the EMCS
d. Note: Balance by measurement of return air, outside air, and mixed air temperatures

shall not be used due to inherent inaccuracy.

4. For systems with airflow measuring stations, measure airflow and coordinate with EMCS installer to calibrate airflow stations at a minimum of three conditions:

    a. Design airflow
    b. 50 percent of design airflow
    c. Minimum airflow

E. Variable Air Volume Air Handlers

1. Adjust fan speed using manual adjustment of variable speed drive for testing only. Do not change or adjust sheaves.
2. Establish minimum static pressure setpoint in conjunction with the EMCS installer as follows. All adjustments made via the EMCS, not field measurements except as noted.

    a. Set all boxes upstream of the static pressure sensor to full shut-off, zero flow.
    b. Set all boxes downstream of the static pressure sensor to operate at maximum airflow setpoints.
    c. For cooling systems only to account for diversity: Calculate diversity ratio as the sum of design airflow rates of terminal boxes divided by fan design airflow rate. Sum up the design airflow of terminal boxes downstream of static pressure sensor**.** Shut off boxes, starting with boxes that are closest to the static pressure sensor, until the airflow equals the diversity ratio times the sum of design airflows downstream of static pressure sensor.
    d. Manually lower fan speed slowly while observing VAV box airflow rates downstream of the static pressure sensor. Stop lowering speed when one or more VAV box airflow rates drops 10 percent below maximum airflow rate setpoint.
    e. Once flow condition in previous step is achieved, note the EMCS system static pressure reading at the duct static pressure sensor.

        (1) This reading becomes the maximum static pressure setpoint.
        (2) Using pressure taps at differential pressure sensor and handheld digital pressure sensor, verify accuracy of EMCS reading.

    f. If there are multiple static pressure sensors, repeat steps above for each sensor. Each sensor will have its own setpoint.
    g. Convey to the EMCS installer

        (1) Static pressure setpoints
        (2) Any discrepancy between EMCS differential pressure reading and handheld measurement

    h. Test Report: Provide a report separate form for this work for each VAV fan system and include as a minimum the following

        (1) Static pressure setpoint and concurrent reading of handheld measurement: Initials of EMCS installer to indicate that the information was transmitted to them.
        (2) Tag of VAV boxes that dropped below design maximum airflow rate in tests above. These are the critical boxes, those requiring the largest static pressure.
        (3) Concurrent fan data

            a) Amps and kilowatts, from EMCS
            b) Variable speed drive speed in hertz
            c) Entering and leaving fan static pressure

d) Flow rate, summed from EMCS terminals
e) Fan airflow sensor reading from EMCS, where applicable

3. Test and adjust minimum outside air flow

a. Supply air fan and return air fan (if any) shall first be operating at design airflow. For VAV systems with diversity, close enough boxes close to fan to reduce supply airflow to scheduled design condition.
b. For systems with economizers and differential pressure sensor across the damper:

(1) For systems with separate two-position outdoor air damper:

a) Open the minimum outdoor air damper and return air damper fully; close the economizer outdoor air damper.
b) Determine outdoor airflow as indicated above.
c) If outdoor airflow rate is above design minimum, adjust damper linkage on minimum outdoor air damper so that intake is at minimum with damper fully stroked.
d) If outdoor airflow rate is below design minimum, temporarily adjust return air damper position via the EMCS until design outdoor airflow is achieved. This position shall be used for testing only and shall not limit the return air damper position during normal operation.

(2) For systems without a separate two-position outdoor air damper:

a) Open return air damper fully.
b) Adjust the outdoor air damper signal through the EMCS until the minimum outdoor airflow rate is achieved.
c) Convey this minimum outdoor air damper signal to EMCS installer and note on air balance report.

(3) Note differential pressure across the outdoor air damper. This value becomes the minimum outdoor air differential pressure setpoint in the EMCS. Convey this setpoint to EMCS installer and note on air balance report.
(4) For systems with CO_2 demand-controlled ventilation

a) With the system at the minimum outdoor air position, reduce supply air fan speed until the outdoor air rate is equal to [0.15 cfm/ft2 of floor area served by the system] [the absolute minimum outdoor air rate on AHU schedule].
b) Note differential pressure across the outdoor air damper. This value becomes the absolute minimum outdoor air differential pressure setpoint in the EMCS. Convey this setpoint to EMCS installer and note on air balance report.

c. For systems with economizers and no active outdoor air control

(1) Determine minimum outdoor air damper signals required to deliver design minimum outdoor airflow rate by adjusting the minimum damper signal through the EMCS at the following conditions:

a) Design supply fan airflow and speed
b) 30 percent of design supply fan speed

(2) Convey the two minimum signals and associated fan speeds to the EMCS installer and note on air balance report.

d. For systems with outdoor airflow measuring stations, see Paragraph 3.4D.4.

4. Test with system operating at design fan and minimum outside air flow conditions described above and record the following on a schematic of the system:

a. Tag
b. Manufacturer and model of fan and motor
c. Sheave data at motor and fan; belt data
d. Motor HP, rpm, volts, phase, FLA
e. Fan airflow rate at all locations measured, as listed above
f. Final measured fan speed and amps
g. Amps and kilowatts, from EMCS
h. Variable speed drive speed in hertz (where applicable)
i. Static pressures measured at

(1) Return air plenum
(2) Mixed air plenum
(3) Downstream of filter
(4) Downstream of coil
(5) Discharge of fans
(6) At static pressure sensor

j. Concurrent airflow rate readings from EMCS airflow sensors, including sum of VAV box airflow rates
k. Minimum EMCS outdoor air control setpoints and signals, where applicable

5. Test and adjust minimum outside air flow

(1) Test with

a) Associated pumps running in automatic maintaining differential pressure setpoint determined above
b) Central plan cooling (heating) equipment operational
c) Controls adjusted to provide coil design water temperature entering coil
d) Fan is running at design airflow
e) Fully open control valve, allow steady-state to be reached, and measure

(2) Measure and record on a schematic of the system

a) Entering water temperature
b) Leaving water temperature
c) Coil differential pressure drop
d) Coil flow rate, from calibrated balance valve or deduced from manufacturer's coil flow vs. pressure drop data, see submittals
e) Coil entering drybulb and wetbulb to cooling coils, drybulb only for heating coils
f) Leaving supply air drybulb and wetbulb from cooling coils, drybulb only for heating coils

6. Documentation of three-way valve bypass balance valve per Paragraph 3.3G

F. Relief Fans

1. Test Conditions: Associated air handler operating in 100% outdoor air position.

2. Total air quantities for fan shall be determined by pitot tube traverse of main ducts near the fan inlet or outlet.
3. Adjust fan speed using manual adjustment of variable speed drive for testing only. Do not change or adjust sheaves,
4. Test and record

    a. Tag
    b. Manufacturer and model of fan and motor
    c. Sheave data at motor and fan; belt data
    d. Motor horsepower, rpm, volts, phase, full load amps
    e. Fan airflow rate
    f. Final measured fan speed and amps
    g. Amps and kilowatts, from EMCS
    h. Variable speed drive speed in hertz
    i. Inlet and outlet static pressure

G. Constant Volume Exhaust Fans

1. See Paragraph 3.4B for air outlet balancing
2. Total air quantities for fan shall be determined by both

    a. Pitot tube traverse of main ducts near the fan inlet, and
    b. Totaling the readings of individual air outlets

3. Total air quantities shall be obtained within 10 percent of design by adjustment of fan speed

    a. Adjust sheaves on fans with adjustable sheaves.
    b. Change sheaves on fans with fixed sheaves. See Paragraph 3.4H.

4. Test and record

    a. Tag
    b. Manufacturer and model of fan and motor
    c. Sheave data at motor and fan; belt data
    d. Motor horsepower, rpm, volts, phase, full load amps
    e. Fan airflow rate at all locations measured, as listed above
    f. Final measured amps
    g. Inlet and outlet static pressure

3.5 ADDITIONAL ITEMS

A. Fans: If drives are not capable of being adjusted to meet required performance, inform Professional and replace sheaves as required.

B. Pumps: Do not trim pump impellers. Adjust flow with pump speed via VFD.

3.6 SPOT CHECKING

A. Spot checks shall take place after test and balance work is complete and reports have been prepared and approved.

B. Spot checks shall be witnessed by an Professional. Schedule spot checks with Professional at least 1 week prior to proposed test date.

C. Professional shall select subsets of any tested and balanced air or hydronic system to be spot-checked on the day of tests without prior notice to the Contractor.

1. Spot-checking will not require more than one working day.
2. If additional spot checks are requested by the Professional causing the time limit above to be exceeded, inform Professional and indicate added price to perform the additional tests. Do not include additional tests in initial bid.

D. Discrepancies

1. If any of the spot-check measurements differ more than 25 percent from those documented in test and balance reports, the Agency shall completely rebalance the associated system. For balance discrepancies at or downstream of a VAV box, rebalance only is required at or downstream of that box.
2. If discrepancies as described above are found on more than 25 percent of the spot-checks for air systems, all air systems shall be rebalanced.
3. If discrepancies as described above are found on more than 25 percent of the spot-checks for hydronic systems, all hydronic systems shall be rebalanced.
4. Rebalance work shall be witnessed by the Professional at the option of the Professional.
5. All rebalance work shall be documented and documentation shall be resubmitted as specified above.
6. All rebalance work shall be provided at no additional cost to the Using Agency.

3.7 TRAINING USING AGENCY PERSONNEL

A. See Section 23 08 00 – Mechanical Commissioning.

B. Go over the final Testing, Adjusting and Balancing Report, explaining the layout and the meanings of each data type.

C. Discuss any outstanding deficient items in control, ducting, piping or design that may affect the delivery of air or water.

D. Identify and discuss any systems or system components that are not meeting their design capacities.

E. Discuss any temporary settings and steps to finalize them for any areas that are not finished or fully occupied.

F. Any other appropriate points that may be helpful for facilities operations, relative to testing, adjusting and balancing or the mechanical systems.

END OF SECTION 23 05 93

SECTION 23 07 00 - MECHANICAL INSULATION

PART – 1 GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Piping insulation
2. Pipe insulation jacket
3. Equipment insulation
4. Ducts and plenums, thermal insulation
5. Duct and plenums, acoustic insulation
6. Duct and plenums, fire rated insulation

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. ASTM B209 – Aluminum and Aluminum-Alloy Sheet and Plate

B. ASTM C177 – Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus

C. ASTM C335 – Steady-State Heat Transfer Properties of Horizontal Pipe Insulation

D. ASTM C585 – Inner and Outer Diameters of Rigid Thermal Insulation for Nominal Sizes of Pipe

E. ASTM C921 – Properties of Jacketing Materials for Thermal Insulation

F. ASTM E84 – Surface Burning Characteristics of Building Materials

G. ASTM E96 – Water Vapor Transmission of Materials

H. NFPA 255 – Surface Burning Characteristics of Building Materials

I. SMACNA – HVAC Duct Construction Standards - Metal and Flexible

J. UL 723 – Surface Burning Characteristics of Building Materials

K. ASTM E 814 – Standard Test Method for Fire Tests of Through-Penetration Fire Stops

1.4 DEFINITIONS

A. Duct Dimensions

1. Where acoustical liner is indicated on the Drawings the duct sizes indicated shall be clear inside dimensions unless duct size is specifically indicated as outside dimensions (OD)

1.5 QUALITY ASSURANCE

A. Source Quality Control

1. Service: Use insulation specifically manufactured for service specified
2. Labeling: Insulation labeled or stamped with brand name and number

B. Applicator: Company specializing in performing the work of this section with minimum three years experience

1.6 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Equipment insulation	R			
Piping insulation	R			
Jackets	R			
Duct insulation, wrap and liner	R			
Adhesives and coatings	R			
Mechanical fasteners	R			

PART – 2 PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Insulation: Cellular glass

1. Pittsburg-Corning
2. Or equal

C. Insulation: fiberglass

1. Owens-Corning Fiberglass Corporation
2. Manville
3. Certainteed Corporation
4. Knauf
5. Or equal

D. Insulation: Elastomeric Closed Cell

1. Armstrong World Industries, Inc.
2. Rubatex Corporation
3. Or equal

E. Weatherproof Aluminum Jacket

1. Childers Products Company
2. Insul-Coustic/Birma Corporation
3. Or equal

F. Pre-molded pipe fitting covers and Jacketing

1. Manville: Zeston
2. Childers Products Company
3. Proto Corporation
4. Insul-Coustic/Birma Corporation
5. Or equal

G. Adhesives

1. Foster Div. Amchem Products Inc.
2. Childers Products Company
3. Epolux Mfg. Corporation
4. Insul-Coustic/Birma Corporation
5. Armstrong 520 Adhesive
6. Or equal

H. Mechanical Fasteners

1. AGM Industries, Inc.
2. Miracle Adhesives Corporation
3. Grip-Nail
4. Or equal

2.2 GENERAL

A. Energy Codes: The current versions of ASHRAE 90.1 shall govern where requirements for thickness exceeds thickness specified

B. All insulation materials, including jackets, facings, adhesives, coatings, and accessories are to be fire hazard rated and listed by Underwriters' Laboratories, Inc., using Standard UL 723 (ASTM E-84), (NFPA-255), (ASA A2.5-1963)

1. Flamespread: maximum 25
2. Fuel contributed and smoke developed: maximum 50
3. Flameproofing treatments subject to deterioration from moisture or humidity are not acceptable

C. Insulation and accessories shall not provide any nutritional or bodily use to fungi, bacteria, insects, rats, mice, or other vermin, shall not react corrosively with equipment, piping or ductwork, and shall be asbestos free: Duct lining shall meet ASTM C1136 and ASTM C665 for biological growth in insulation

2.3 MATERIALS

A. Pipe Insulation

1. Cellular Glass

a. Insulation (without jacket) ASTM C 552, Type II, Class 1
b. Insulation (with jacket) ASTM C552, Class 2
c. Sectional
d. 0.32 maximum K-factor at 75 degrees Fahrenheit mean temperature
e. Pittsburg-Corning or equal

2. Fiberglass

a. ASTM C547, Type I, Molded: one piece, with factory-applied, all purpose, vapor retarder jacket, maximum 0.26 K factor at 75 degrees Fahrenheit mean temperature: Owens-Corning ASJ/SSL-II Pipe Insulation or equal
b. ASTM C553, Type II, Blanket: without facing and with all service FSK jacket manufactured from kraft paper, reinforced scrim and aluminum foil, minimum 1 lb. density, maximum 0.28 K factor at 75 degrees Fahrenheit mean temperature: Owens-Corning Faced Duct Wrap or equal
c. ASTM C612, Type 1B, Board: Density as noted with FSK all service jacket manufactured from kraft paper, reinforced scrim and aluminum foil, maximum 0.26 K factor at 75 degrees Fahrenheit mean temperature: Owens-Corning 700 Series with face or equal

3. Flexible, closed cell elastomeric thermal insulation

a. Insulation ASTM C534
b. Service rating of 220 degrees Fahrenheit
c. Density 6.0 pounds per cubic foot
d. Closed cell foam: Vapor permeability ASTM E96 0.2 perm
e. Max moisture absorption: 1.0 percent by volume, 10 percent by weight
f. Molded pipe insulation

(1) Maximum 0.27 K factor at 75 degrees Fahrenheit mean temperature
(2) Maximum water vapor transmission rating of 0.17 perm-inches

g. Sheet insulation

(1) Maximum 0.28 K factor at 75 degrees Fahrenheit mean temperature
(2) Maximum water vapor transmission rating of 0.17 perm-inches

h. Seal with Rubatex adhesive or equal: Armstrong Armaflex II or equal

4. Underground pipe insulation: See Section 23 21 12 – Heating and Cooling Piping

B. Jackets

1. Factory Applied Vapor Barrier All Service Jacket (ASJ)

a. ASTM C921, White kraft paper bonded to aluminum foil and reinforced with glass fiber yarn
b. Moisture Vapor Transmission: ASTM E96; 0.02 perm inches
c. Secure with self sealing longitudinal laps and butt strips
d. Secure vapor barrier mastic
e. Tie Wire: See Paragraph E.1, with twisted ends on maximum 12 inch centers

2. Vapor Barrier Lap Adhesive: Compatible with insulation

a. Canvas Jacket: UL listed
b. Fabric: ASTM C921, 6 ounce/square yard, plain weave cotton treated with dilute fire retardant lagging adhesive
c. Lagging Adhesive: Compatible with insulation

3. Aluminum Jacket: ASTM B209

a. Use for weatherproof jacket
b. Thickness: 0.016 inch sheet
c. Finish: Embossed
d. Joining: Longitudinal slip joints and 2 inch laps
e. Fittings: 0.016 inch thick die shaped fitting covers with factory attached protective liner
f. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel

4. Preformed PVC

a. Polyvinylchloride covers similar to Manville Zeston.
b. Color: white

5. Equipment insulation facings: Foil-scrim-kraft laminate of aluminum foil facing, glass scrim reinforcing, kraft paper backing

C. Preformed Pipe Fitting Covers

1. Aluminum

a. Factory fabricated formed covers
b. General Aluminum Supply Corporation GASCO or equal

2. PVC

a. Factory fabricated formed covers
b. Manville Zeston or equal

D. Adhesives and coatings

1. Foster product names and figure numbers or equal

    a. Lagging adhesive: 30-36
    b. Fiberglass: Zeston Z-Glu
    c. Vapor barrier coating: Tite-fit 30-80, UP Label, comply with MIL-C-19565C, Type II; fire and water resistant
    d. Vaporseal adhesive: 85-60
    e. Cellular glass bedding and sealing compound adhesive: Foamseal 30-45
    f. Outdoor mastic: 30-90
    g. Asphalt mastic: C.I. Mastic 60-25
    h. For elastomeric insulation: 520 contact adhesive

E. Wire, banding and fastening devices

1. Wire: minimum 16 gauge copper clad annealed steel wire
2. Bands: 3/4 inches nominal width with wing seals, of minimum thickness as follows:

    a. Aluminum: 0.007 inches. Except where exposed to weather, 0.020 inches
    b. Stainless steel: 0.010 inches

3. Staples: outward clinching type of corrosion resistant steel

F. Mechanical Fasteners

1. Mild steel, copper plated
2. AGM Industries Power Base insulation pins or equal
3. Insulation washers

    a. Galvanized steel
    b. 1- 1/2 inch diameter
    c. AGM Industries SLW-1 or equal

G. Provide a continuous vapor seal for any service piping that carries liquid below 60 degrees Fahrenheit.

H. Pre-insulated pipe support and shields

1. Provide insulated pipe supports for all insulated pipe and tubing. Insulated pipe supports shall be Pipe Shields, Inc. or equal
2. All insulated pipe supports shall be load rated. Load ratings shall be established by pipe support manufacturer based upon testing and analysis in conformance with the latest edition of the following codes: ASME B31.1, MSS SP-58, MSS SP-69 and MSS SP-89.
3. All insulated pipe supports shall have Calcium Silicate insulation and galvanized steel jackets. Pipe supports for use on flat surfaces shall have integral load distribution plates coated with zinc primer minimum 3 mils thick.
4. See Section 23 05 29 Hangers and Supports
5. Hangers and supports shall fit outside of all pipe insulation and insulation inserts. Provide pre-insulated pipe supports as specified and install per manufacturer's installation instructions. Shield lengths and gauges shall also be per manufacturer's recommendations.
6. Tape all butt joints where pipe insulation butts up against hanger shield

    a. On hot pipe, apply three inch wide vapor barrier tape or band over the butt joint
    b. On chilled water piping, apply a wet coat vapor barrier lap cement on all butt joints and

seal the joints with a minimum of three inch wide vapor tape or band

I. Fire-stopping

1. At pipe penetrations through rated assemblies
2. Commercial pipe sleeve assemblies that are UL listed and that have been approved by the fire marshal for this purpose
3. Insulation shall be continuous through penetration.

J. Accessories

1. Insulation Protection Saddles: 12-inch long, 16 gauge steel
2. Paint: Ultraviolet resistant latex paint with special adherence capabilities to the fitting covers, elastomeric, aluminum facing, Kraft paper, tapes and adhesives

K. Equipment Insulation

1. Glass fiber, semi-rigid

a. Insulation: ASTM C612; rigid, noncombustible

(1) 'K' ('ksi') value: ASTM C335, 0.24 at 75 degrees Fahrenheit
(2) Maximum service temperature: 450 degrees Fahrenheit
(3) Maximum moisture absorption: 0.1 percent by volume
(4) Density: 3.0 pounds per cubic foot density

b. Vapor Barrier Jacket

(1) Kraft paper reinforced with glass fiber yarn and bonded to aluminized film
(2) Moisture vapor transmission: ASTM E96; 0.04 perm
(3) Secure with self sealing longitudinal laps and butt strips. Minimum lap 2 inches
(4) Secure with bands, adhesive or ties

c. Facing: 1 inch galvanized or stainless steel hexagonal wire mesh stitched on one face of insulation
d. Vapor Barrier Lap Adhesive: Compatible with insulation
e. Insulating Cement/Mastic: ASTM C195; hydraulic setting on mineral wool

2. Flexible Elastomeric

a. Insulation: ASTM C534, Type II sheet materials
b. Service rating of 220 degrees Fahrenheit
c. Density 6.0 pounds per cubic foot
d. Closed cell foam: Vapor permeability ASTM E96 0.2 perm
e. Max moisture absorption: 1.0 percent by volume, 10 percent by weight
f. Sheet insulation

(1) Maximum 0.28 K factor at 75 degrees Fahrenheit mean temperature
(2) Maximum water vapor transmission rating of 0.17 perm-inches

g. Seal with Rubatex adhesive or equal: Armstrong Armaflex II or equal

3. Jackets

a. Aluminum

b. Use for weatherproof jacket
c. Thickness: 0.016 inch sheet
d. Finish: Embossed
e. Joining: Longitudinal slip joints and 2 inch laps
f. Fittings: 0.016 inch thick die shaped fitting covers with factory attached protective liner
g. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel

4. Equipment insulation facings: Foil-scrim-kraft laminate of aluminum foil facing, glass scrim reinforcing, kraft paper backing
5. Wires, bands and fastening devices

a. Wires: Minimum 16 gage galvanized steel wire
b. Bands: 3/4 inch nominal width wing seals, of minimum thickness as follows

(1) Aluminum: 0.007 inches indoors. Where exposed to weather 0.020 inches
(2) Stainless Steel: 0.010 inches

L. Duct Insulation

1. Duct Wrap With Vapor Barrier; Type DW-V

a. Insulation: ASTM C553 and C612; flexible, noncombustible blanket

(1) 'K' ('Ksi') value: ASTM C518, 0.24 at 75 degrees Fahrenheit
(2) Maximum service temperature: 350 degrees Fahrenheit
(3) Maximum moisture absorption: 0.20 percent by volume

b. Vapor Barrier Jacket - factory installed. (FSK)

(1) Kraft paper reinforced with glass fiber yarn and bonded to aluminized film
(2) Moisture vapor transmission: ASTM E96 Procedure E; 0.02 perm
(3) Secure with pressure sensitive tape

c. Vapor Barrier Tape: Kraft paper reinforced with glass fiber yarn and bonded to aluminized film, with pressure sensitive rubber based adhesive

(1) Flexible fiberglass wrap. 1-1/2 pounds per cubic foot
(2) Installed conductance: 0.30 BTU-inch/hr/square foot/degree Fahrenheit
(3) Factory applied jacket

a) Foil-scrim-kraft laminate: Aluminum foil facing
b) Glass scrim reinforcing
c) Kraft paper backing

(4) Maximum vapor permeance: 0.02 perms

d. Owens-Corning All Service Faced Duct-Wrap or equal

2. Duct Wrap Without Vapor Barrier; Type DW

a. Insulation: ASTM C553 and C612; flexible, noncombustible blanket

(1) 'K' ('Ksi') value: ASTM C518, 0.24 at 75 degrees Fahrenheit
(2) Maximum service temperature: 350 degrees Fahrenheit

(3) Maximum moisture absorption: 0.20 percent by volume

b. Owens-Corning or equal

3. Duct Board Without Vapor Barrier; Type DB

a. Insulation: ASTM C612; rigid, noncombustible blanket

(1) K (Ksi) value: ASTM C518, 0.23 at 75 degrees Fahrenheit
(2) Maximum service temperature: 350 degrees Fahrenheit
(3) Maximum moisture absorption: 0.20 percent by volume

b. Installed conductance: 0.23 BTU-inch/hr/square foot/degree Fahrenheit
c. Thickness per Paragraph 3.5A Duct Insulation Type and Thickness Schedule
d. Owens-Corning Type 703 or equal

4. Duct Board With Vapor Barrier; Type DB-V

a. Insulation: ASTM C612; rigid, noncombustible blanket

(1) 'K' ('Ksi') value: ASTM C518, 0.23 at 75 degrees Fahrenheit
(2) Maximum service temperature: 350 degrees Fahrenheit
(3) Maximum moisture absorption: 0.20 percent by volume

b. Vapor Barrier Jacket - factory installed (FSK)

(1) Kraft paper reinforced with glass fiber yarn and bonded to aluminized film
(2) Moisture vapor transmission: ASTM E96; 0.02 perm
(3) Secure with pressure sensitive tape

c. Vapor Barrier Tape: Kraft paper reinforced with glass fiber yarn and bonded to aluminized film, with pressure sensitive rubber based adhesive
d. Installed conductance: 0.23 BTU-inch/hr/square foot/degree Fahrenheit
e. Thickness per Paragraph 3.5A Duct Insulation Type and Thickness Schedule
f. Factory applied jacket

(1) Foil-scrim-kraft laminate

a) Aluminum foil facing
b) Glass scrim reinforcing

5. Tie Wire: Annealed steel, 16 gage

M. Duct and Plenum Lining

1. Rectangular Duct Lining; Type AL

a. Material

(1) Insulation: ASTM C423
(2) 'K": ASTM C518, 0.23 at 75 degrees Fahrenheit
(3) Maximum service temperature: 350 degrees Fahrenheit
(4) Maximum moisture absorption: 0.20 percent by volume
(5) Thickness per Paragraph 3.5A Duct Insulation Type and Thickness Schedule
(6) 1-1/2 pounds per cubic foot unless shown otherwise to be 3 pounds per cubic

foot
(7) Installed conductance: 0.25 BTU-inch/hr/square foot/degree Fahrenheit

b. Interior air-side surface

(1) Smooth black neoprene or matte facing overlay on air side. Coating shall conform to NFPA 90A, ASTM C665, ASTM G21
(2) Suitable for velocity up to 4000 feet per minute
(3) Meet erosion test method described in UL publication No. 181
(4) Durable and mechanically cleanable
(5) EPA registered anti-microbial agent
(6) Certainteed Toughgard Duct Liner or equal
(7) Adhesives

a) Duct Insulation, Internal: Foster 85-60 or equal
b) Weld Pins: Duro-Dyne CP or equal

2. Round Duct Lining; Type RAL

a. Material same as Paragraph 2.3M.1.a
b. Interior air-side surfaces same as Paragraph 2.3M.1.b
c. Self-supporting, slide-in installation
d. Schuller Permacote Spiracoustic or equal
e. Small diameter ducts which cannot be insulated internally using duct lining materials shall be pre-fabricated. Insulation material shall be fixed between outer duct metal and a perforated metal liner. United McGill k27 series or equal. Fittings shall be insulated to same standard and shall be by same manufacturer.

3. Plenum Lining; Type PL

a. Material same as Paragraph 2.3M.1.a
b. Interior air-side surfaces same as Paragraph 2.3M.1.b

2.4 DUCT FIREPROOFING

A. Material applied directly to metal ducts and achieving 1- or 2-hour fire rated separation (as required by application) when tested in accordance with UL 1978 by independent testing agency.

1. Surface Burning Characteristics: Flame spread index of 0 and smoke developed index of 0, when tested in accordance with ASTM E 84, both blanket and foil
2. Combustibility: Non-combustible, when tested in accordance with ASTM E 136
3. Flexibility: Capable of being formed around corners and shapes by hand
4. Fiber Content: Demonstrated to be soluble in the lungs according to EU 67/548/EWG, Note Q for biopersistence
5. Surface: Foil or other damage resistant surface; fiber not exposed after installation
6. Accommodation for Duct Access Doors and Panels: Capable of being installed to achieve fire rating without impeding access.
7. Acceptable Product: 3M Fire Barrier Duct Wrap; fire resistant inorganic blanket encapsulated with scrim-reinforced foil facing.

B. Fasteners: Non-combustible; use one or both of the following to attach fireproofing to ducts

1. Banding: Steel or stainless steel, 1/2 inch wide, minimum, and 0.015 inch thick, minimum; with steel banding clips

2. Insulation Pins: Copper-coated steel impalement pins, minimum 12 gage, for welded attachment, with galvanized steel self-locking washers, 1-1/2 inch square or diameter; or equivalent sized cup-head pins

C. Access Panel Hardware: Galvanized threaded rods, sleeves, washers, and wing nuts as specified in manufacturer's instructions

D. Tape: Aluminum foil tape for sealing exposed fiber edges and repairing tears in facing

E. Fire-stopping: Material tested in conjunction with wrap in accordance with ASTM E 814 to achieve fire rated penetration seal at penetrations through fire rated assemblies

1. Fire Rating: Same or greater than rating of penetrated assembly
2. Acceptable Products: 3M Fire Barrier 1000 N/S, 1003 S/L, and 2000+ Silicone Sealants, as required by tested assembly

PART – 3 EXECUTION

3.1 PIPE & EQUIPMENT INSULATION SCHEDULE

A. Insulation Application Types

1. Type P-1

a. Molded fiberglass
b. All-service jacket
c. Vapor-sealed

2. Type P-1A

a. Molded fiberglass
b. PVC jacket
c. Vapor-sealed

3. Type P-2

a. Molded fiberglass
b. All-service jacket

4. Type P-2A

a. Molded fiberglass
b. Aluminum preformed jacket or PVC jacket

5. Type P-3: Flexible elastomeric insulation
6. Type P-4

a. Cellular glass insulation
b. All service jacket with vapor retarder

7. Type P-4A

a. Cellular glass insulation
b. All service jacket with vapor retarder

c. PVC jacket

8. Type E-1

a. Fiberglass board
b. 3 pounds per cubic foot density
c. Foil-scrim-kraft facing
d. Vapor-sealed

9. Type E-2

a. Fiberglass board
b. 6 pounds per cubic foot density
c. Segmented or scored for curved surfaces

10. Type E-3: Flexible cellular foam insulation

B. Application Schedule

Service	Type	Size	Minimum Thickness	Freeze Protection
Chilled Water (indoor concealed)	P-4	All	1-1/2 inch	-
Chilled Water (Indoor exposed, including mechanical rooms)	P-4A	All	1-1/2 inch	-
Chilled Water Pumps	E-3	All	1-1/2 inch	-
Chilled Water Air Separators, Storage Tanks, and Expansion Tanks	E-3	All	1-1/2 inch	-
Hot Water (indoor concealed)	P-1	≤2 inch	1-1/2 inch	-
Hot Water (indoor exposed, including mechanical rooms)	P-1A	≥2-1/2 inch	1-1/2 inch	-
Hot Water Pumps	E-2 or E-3	All	1-1/2 inch	-
Heating Water Air Separators, Storage Tanks, and Expansion Tanks	E-3	All	1-1/2 inch	-
Hot water coil frame and tube bends	E-2 or E-3 or DW-V duct wrap	All	1/2 inch(E-2/3) 1-1/2 inch DW-V	
Condensate, and sanitary sewer waste/vent piping receiving condensate (horizontal piping and first three feet of vertical piping, Underside of floor drain bodies	P-3	All	1/2 inch	-

Service	Type	Size	Minimum Thickness	Freeze Protection
receiving condensate)				
Refrigerant (suction)	P-3	All	3/4 inch	-
Domestic cold water (indoor concealed)	P-1	All	1/2 inch	-
Domestic cold water (indoor exposed)	P-1A	All	1/2 inch	-
Domestic cold water (exterior exposed)	P-1B	All	1 inch	Yes
Domestic hot water (indoor concealed)	P-1	All	1 inch	-
Domestic hot water (indoor exposed, including mechanical rooms)	P-1A	All	1 inch	-
Roof drains (horizontal and first three feet of vertical piping)	P-1	All	1/2 inch	-
Roof drains (underside of roof drain bodies/bowl)	P-3	All	1/2 inch	-

C. Non-insulated piping and equipment

1. Pneumatic tubing
2. Cooling coil condensate drains except horizontal and first three feet of vertical
3. Condenser water piping and condenser water pumps (indoors)
4. Vent, overflow, drain and relief, except as noted otherwise
5. Hot water control valves. (Note: this exclusion applies only to the valves themselves; all other hot water piping and accessories, including that between isolation valves and coils, shall be insulated.)

3.2 INSTALLATION

A. Install materials in accordance with manufacturer's instructions

B. Coordinate with work of other trades

C. Deliver material to job site in original non-broken factory packaging, labeled with manufacturer's density and thickness

D. Install insulation where it cannot become wet. If insulation becomes wet, remove and dispose of properly and replace with new, dry insulation. Wetted insulation is not acceptable. Ensure insulation is dry before and during installation.

E. Insulate all piping, valves, fittings, flanges and accessories

F. On piping exposed to public view, locate insulation and cover seams in least visible locations

G. Insulate fittings, joints and valves with insulation of same material and thickness as adjoining pipe. Use pre-molded fiberglass fitting covers or radial mitered segments of pipe insulation. For strainers, expansion joints, fittings and accessories requiring servicing or inspection insulation shall be removable and replaceable without damage. Enclose within two-piece no. 15 gauge aluminum covers fastened with cadmium-plated bolts and nuts.

H. Insulate flanges with insulation sleeve of same material as pipe insulation to cover flange and overlap insulation on adjacent piping

I. Continue insulation through walls, sleeves, pipe hangers and other pipe penetrations

J. Finish insulation at supports, protrusions and interruptions. No hangers or supports shall be embedded in insulation. Do not insulate expansion bellows.

K. Fiberglass insulation

1. Provide insulation with factory applied vapor barrier jackets
2. Butt edges neatly. ASJ with 3 inch minimum butt strips
3. Longitudinal overlaps: Minimum 2 inch self sealing, double adhesive
4. Apply additional jacket as specified
5. For insulation with factory-applied jackets, secure laps with aluminum or stainless steel bands at 18 inches o.c.
6. For piping conveying fluids below ambient temperature finish with vapor barrier adhesive

L. Cellular glass Insulation

1. Provide insulation with factory applied vapor barrier jackets
2. Butt edges neatly. Seal longitudinal and transverse joints with adhesive to maintain minimum vapor permeance. Adhesive shall be selected and applied in accordance with insulation manufacturer’s recommendations.
3. Secure insulation sections with bands without deforming insulation materials
4. Build up coating of insulating and finishing cement
5. For insulation with factory-applied jackets, secure laps with aluminum or stainless steel bands at 18 inches o.c.
6. For piping conveying fluids below ambient temperature finish with vapor barrier adhesive
7. Apply additional jacket as specified. If no additional jacket specified apply skim coat of finishing cement to smooth out surface of fitting insulation

M. Elastomeric Tubing

1. Provide insulation
2. Butt edges neatly. Seal longitudinal and transverse joints with adhesive to maintain minimum vapor permeance. Adhesive shall be selected and applied in accordance with insulation manufacturer’s recommendations.
3. Apply additional jacket as specified

N. For all pipe systems exposed in the mechanical equipment rooms, finish with an all service PVC

jacket

O. For exterior applications, provide vapor barrier jacket. Insulate fittings, joints, and valves with insulation of like material and thickness as adjoining pipe, and finish with glass mesh reinforced vapor barrier cement. Cover with aluminum jacket with seams located on bottom side of horizontal piping.

P. For buried piping, provide factory fabricated assembly with inner all-purpose service jacket with self sealing lap, and asphalt impregnated open mesh glass fabric, with one mil thick aluminum foil sandwiched between three layers of bituminous compound; outer surface faced with a polyester film.

Q. Perform work at ambient and equipment temperatures as recommended by adhesive manufacture

R. Protection: Protect against dirt, water, chemical, or mechanical damage before, during, and after installation. Repair or replace damaged insulation at no additional cost

S. Paint all insulation exposed to ultraviolet light (sunlight); see Paragraph 2.3J.2

T. All vapor barriers shall be continuous. Tears, holes, staples, etc. shall be coated with vapor barrier mastic and patch with facing or tape.

U. Joints between insulation and access shall be sealed with vapor barrier mastic

V. See Section 23 21 12 – Heating and Cooling Piping

W. See Section 23 23 00 – Refrigerant Piping

X. See Section 23 31 13 – Ducts

3.3 PIPE INSULATION APPLICATION

A. General

1. Before applying insulation

   a. Test piping for tightness and obtain approval
   b. Clean surfaces to be insulated of dust, grease and foreign matter

2. Butt edges neatly
3. Fill voids with insulating cement
4. Longitudinal overlaps

   a. 2 inches minimum
   b. For exposed work: toward ceiling or wall
   c. For weatherproof aluminum jackets: on side to shed water

5. Circumferential overlaps on weatherproof aluminum jackets: 2 inches minimum
6. Continuous insulation passing through sleeves or other openings
7. Oversize insulation to accommodate heat tracing on piping

B. Valves, fittings, flanges and accessory insulation

1. Unless otherwise noted, insulate

a. Valves including bonnets
b. Flanges
c. Fittings
d. Strainers
e. Expansion joints
f. Specialties

2. Insulation for strainers, expansion joints, fittings and accessories requiring servicing or inspection

a. Insulation removable and replaceable without damage
b. Enclosed within two piece, No. 18 gauge aluminum covers fastened with cadmium plated bolts and nuts

3. Insulation of same thickness as adjacent piping insulation
4. For piping systems insulated with fiberglass

a. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
b. When premolded insulation elbows and fittings are not available, apply mitered sections of pipe insulation (blanket insulation is not acceptable) to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire, tape, or bands.
c. Cover fittings with heavy PVC fitting covers. Overlap PVC covers on pipe insulation jackets at least 1 inch at each end. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

5. For piping systems insulated with cellular glass

a. Apply premolded insulation sections of the same material as straight segments of pipe when available. Secure according to manufacturer’s written instructions.
b. When premolded insulation elbows and fittings are not available, apply mitered sections of pipe insulation (blanket insulation is not acceptable) to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire, tape, or bands.
c. Cover fittings with heavy PVC fitting covers. Overlap PVC covers on pipe insulation jackets at least 1 inch at each end. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

6. For piping systems insulated with elastomeric thermal insulation

a. Apply mitered sections of pipe insulation.
b. Secure insulation materials and seal seams with manufacturer's recommended adhesive. Cement to avoid openings in insulation that will allow passage of air to the pipe surface.

7. Flanges

a. Apply preformed pipe insulation to outer diameter of pipe flange
b. Make width of insulation segment the same as overall width of the flange and bolts, plus twice the thickness of the pipe insulation
c. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with the same insulation material as adjacent piping insulation
d. Apply canvas jacket material with manufacturer's recommended adhesive, overlapping seams at least 1 inch, and seal joints with vapor-retarder mastic

8. Finish for outdoor locations only: weatherproof aluminum jacket compatible with weatherproof jacket on adjoining pipe insulation.

C. At pipe hangers

1. Insulation protection shields specified in Section 23 05 29 Hangers and Supports
2. Butt insulation to shields
3. Cold piping: Wet coat of vapor barrier lap cement on all butt joints

D. Jackets and facings

1. Vapor-sealed types: continuous; staples not permitted
2. Adhere longitudinal laps: Adhere 3 inches wide joint strip, of same material as facing, at center of each butt joint
3. Adhesives

a. Vapor-sealed insulation: vapor-seal adhesive
b. Heating service insulation: vapor-seal adhesive
c. Weatherproof aluminum jacket: sealing compound
d. Underground asphalt felt jacket: asphalt mastic

E. Wiring, banding and fastening devices: Secure insulation to piping and equipment in accordance with following minimum requirements

1. Piping insulation section 3 foot long

a. Concealed vapor-sealed insulation banded at ends and center
b. Other concealed insulation banded at ends and center

2. Pipe fitting insulation

a. Loops of wire to secure mitered segments of insulation
b. Wire spiraled on from end to end on blanket insulation

3. Outdoor piping weatherproof aluminum jackets banded at circumferential joints and center of each section: Lap joint at bottom

3.4 EQUIPMENT INSULATION

A. Apply insulation close to equipment by grooving, scoring, and beveling insulation. Secure insulation to equipment with bands, welded-on anchors, ties or adhesive. Where access to equipment is required for testing or maintenance the insulation shall be installed so that it is removable and so that the vapor barrier can be remade after access.

B. Fill joints, cracks, seams, and depressions with bedding compound to form smooth surface. On cold equipment, use vapor barrier cement.

C. For cold equipment or equipment containing fluids below ambient temperature

1. Insulate entire system
2. Provide vapor barrier jackets, factory applied or field applied
3. Finish with glass cloth and vapor barrier adhesive
4. Cover with aluminum jacket where specified

D. For equipment containing fluids above ambient temperature

1. Insulate entire system
2. Provide standard jackets, with or without vapor barrier, factory applied or field applied
3. Finish with glass cloth and adhesive
4. Cover with aluminum jacket where specified
5. For hot equipment containing fluids 140 degrees Fahrenheit or less, do not insulate flanges and unions, but bevel and seal ends of insulation
6. For hot equipment containing fluids over 140 degrees Fahrenheit, insulate flanges and unions with removable sections and jackets

E. Finish insulation at supports, protrusions, and interruptions

F. For equipment in mechanical equipment rooms or in finished spaces, finish with aluminum jacket

G. Do not insulate over nameplate or ASME stamps; bevel and seal insulation around such

H. General

1. Apply insulation with edges tightly butted

a. Joints staggered and secured in place by steel bands
b. Where necessary weld on suitable anchors

2. Seal with 520 adhesive

I. Special considerations

1. Chiller heads: removable and replaceable covers to allow tube removal
2. Strainers and suction diffusers: removable and replaceable covers to allow strainer removal
3. Pumps: removable and replaceable covers to allow impeller replacement
4. Provide sufficient clearance around openings for normal operation of equipment

3.5 DUCT & PLENUM INSULATION

A. Duct Insulation Type and Thickness Schedule

Location	Cooling or Heat/Cool Supply	Heating-only Supply	Return/Outdoor Air	Exhaust
Concealed in ceiling or return air plenum	2 inches DW-V	2 inches DW-V	1-1/2 inches DW-V	-
Concealed in unconditioned spaces	2 inches DW-V	2 inches DW-V	1-1/2 inches DW-V	-
Exposed within mechanical rooms	2 inches 3.0 pounds Per cubic foot DB-V	2 inches 3.0 pounds Per cubic foot DB-V	1-1/2 inches 3.0 pounds Per cubic foot DB-V	-
Exposed within conditioned space	–	–	–	-
Lined duct on drawings at risers	2 inches 1.5 pounds per Cubic foot AL	2 inches 1.5 pounds per Cubic foot AL	2 inches 1.5 pounds per Cubic foot AL	2 inches 1.5 pounds per Cubic foot AL

Location	Cooling or Heat/Cool Supply	Heating-only Supply	Return/Outdoor Air	Exhaust
Lined duct on drawings (unless otherwise noted)	1 inch 1.5 pounds per Cubic foot AL or RAL	1 inch 1.5 pounds per Cubic foot AL or RAL	1 inch 1.5 pounds per Cubic foot AL or RAL	1 inch 1.5 pounds per Cubic foot AL or RAL
Transfer air ducts	1 inch 1.5 pounds per Cubic foot AL or RAL	1 inch 1.5 pounds per Cubic foot AL or RAL	1 inch 1.5 pounds per Cubic foot AL or RAL	1 inch 1.5 pounds per Cubic foot AL or RAL
Terminal cans	0.5 inches 1.5 pounds per cubic foot AL	0.5 inches 1.5 pounds per cubic foot AL	0.5 inches 1.5 pounds per cubic foot AL	-
Flex duct	By manufacturer	By manufacturer	By manufacturer	-
Double wall duct	1 inch 1-1/2 pounds Per cubic foot DW	1 inch 1-1/2 pounds Per cubic foot DW	-	-
Air distribution devices (backpans of grilles, registers, and diffusers)	2 inches DW-V	2 inches DW-V	1-1/2 inches DW-V	

3.6 NON-INSULATED DUCTWORK

A. No insulation required for ducts so indicated in Duct Insulation Type and Thickness Schedule, plus

1. Exhaust ducts, unless shown to be lined

B. Do not line ducts

1. Where prohibited by codes
2. Food service exhaust
3. Dishwasher exhaust
4. Shower exhaust
5. Ten feet downstream from humidifiers

3.7 DUCT INSULATION INSTALLATION

A. General

1. Ensure that insulation is continuous through all walls: See 23 05 48 Mechanical Sound and Vibration Control for packing openings through walls
2. Finish insulation neatly at hangers, supports and other protrusions
3. Locate insulation joints or cover seams in least visible locations
4. Where ducts run in groups too close to be individually insulated and finished

   a. Completely fill all spaces between ducts with rigid or flexible insulating material
   b. Insulate and finish exterior surfaces of group as specified for particular service

5. Where ducts cannot be insulated after erection, insulate prior to installation

6. Where specified thickness of insulation and/or lining exceeds available thickness in single layer, provide insulation and/or lining in 2 or more layers with joints staggered
7. Preparation

    a. Do not install covering before ductwork and equipment has been tested and reviewed
    b. Ensure surface is clean and dry prior to installation
    c. Ensure insulation is dry before and during application

8. Mechanical fasteners

    a. Use spot weld anchors in all shop fabricated internally lined ducts
    b. Adhered anchors
    c. Clip off pin penetrations flush with insulation surface or facing
    d. Seal pins and washers where pins penetrate vapor barriers

        (1) With 4 inch square pieces of vapor barrier material to match facing
        (2) Adhere with vaporseal adhesive

    e. Spacing on rectangular ducts

        (1) Typical of horizontal and vertical, unless otherwise specified
        (2) Duct board

            a) 3 inches in from edges
            b) Intermediate fasteners: 12 inches on counter maximum spacing all directions
            c) Not less than four pins per surface

        (3) Duct Wrap

Side Dimension	Maximum Spacing
24 inches and under	None required.
25 to 32 inches	Horizontal - none. Vertical: 1 row centered, 12 inches on center
33 to 48 inches	2 rows, 12 inches on center.
49 to 60 inches	3 rows, 12 inches on center.
61 inches and over	16 inches on center, all directions.

        (4) Duct wrap spacing applicable to flat surfaces of flat oval ducts

9. Provide 24 gauge sheet metal Z section frames over edges of duct and plenum lining

    a. At access openings and doors
    b. Along edges exposed to air flow

B. Rectangular Duct Wrap

1. Without vapor barrier

    a. Comply with published recommendations of manufacturer and with following
    b. Secure with 4 inch strips of adhesive, 8 inches on center
    c. For rectangular ducts 24 inches and wider, secure to bottom of duct with mechanical fasteners 18 inches on center

d. Wrap with 18 gauge galvanized wire, 16 inches on center

2. With Vapor Barrier

a. Vapor barrier and sealing continuous without breaks. Vapor proof seal around supports and bracing
b. 2 inches lap strip at one end
c. Peel insulation for 2 inch lap strip along longitudinal joints
d. Seal lap strips with vaporseal adhesive; Foster's 85-60 or equal

C. Round Duct Wrap

1. General

a. Adhere flexible insulation to ductwork with adhesive applied in 6 inch wide strips on 16 inch centers
b. Provide 16 gauge annealed tie wire tied, spiral wound or half hitched at 16 inch centers
c. Overlap insulation 2 inches and seal joints and breaks with 2 inch lap of foil adhered over joint

2. Apply duct wrap with vapor barrier as specified above for rectangular ducts

D. Duct Board

1. Comply with published recommendations of manufacturer
2. Secure on top, sides and bottom of duct with mechanical fasteners, spacing as scheduled
3. Secure with 4 inch strips of adhesive, 8 inch on center

E. Rectangular Duct and Plenum Lining

1. Comply with SMACNA Duct Liner Application Standard, published recommendations of manufacturer, and following:
2. Apply adhesive over 100 percent of surfaces to be lined
3. The coated surface shall face air stream
4. Surface adjacent to air flow, including at joints, to be uniformly flat
5. Insulation on floors of plenums and large ducts where access is required shall be protected by wire mesh so that lining is not damaged when walked or crawled on.
6. Blank-Off Panels: Insulation, enclosed with sheet metal on all sides; all joints with vapor barrier mastic and taped
7. Volume Dampers: Where volume dampers do not allow for continuous insulation, terminate insulation clear of handle sweep and finish edges to maintain vapor barrier and to prevent damage to the insulation
8. Seal butt joints and exposed edges of liner to prevent erosion
9. Edges at terminal points shall be provided with metal beading and heavily coated with adhesive
10. Damaged areas replaced or heavily coated with adhesive
11. Mechanical fasteners

a. Use weld pins
b. Install mechanical fasteners

(1) Weld pins flush with liner surface. Weld pins spaced maximum of 12-inch on center in both directions and within 2 inches of all corners and joints, except where SMACNA Standard requires closer spacing
(2) Within 2 inches of all edges

(3) Minimum 4 pins per side
(4) For field alterations of lined ducts, install adhesive and glued pins with washers. Clip-off pins after washers installed. Field installed pins shall be used for unusual conditions only and shall not exceed 1 percent of total pins.

3.8 PENETRATIONS THROUGH RATED WALLS

A. Refer to drawings for penetrations of rated assemblies.

B. Install per manufacturer's installation and listing requirements.

3.9 FIELD QUALITY CONTROL

A. Repair separation of joints or cracking of insulation due to thermal movement or poor workmanship

B. All vapor barriers shall be continuous; tears, holes, staples, etc. shall be coated with vapor barrier mastic and patch with facing or tape

C. See Section 23 31 13 – Ducts for protection of lined duct during construction

END OF SECTION 23 07 00

SECTION 23 09 00 - ENERGY MANAGEMENT AND CONTROL SYSTEM - GENERAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. A Request for Proposals (RFP) will be issued by the Professional to receive bids for the Energy Management and Control System (EMCS) contractor selection. The RFP shall be distributed to the approved EMCS contractors referenced herein and sealed proposals received by the Professional. The Professional will make an EMCS contractor recommendation to the Owner based upon proposals received.

B. An allowance for inclusion in the Contract Sum has been specified in Division One Supplement, Section 01900, “Part 2 – Allowance Supplement” for purchase of the EMCS.

C. Contractor shall furnish and install a direct digital control and Energy Management and Control System (EMCS).

D. The systems to be controlled under work of this Section include but are not limited to the following:

1. HVAC Systems
2. Plumbing Systems
3. Irrigation Systems
4. Lighting
5. Building Electrical Systems
6. Site Utilities

1.3 RELATED WORK AND REQUIREMENTS

A. Other EMCS Sections:

1. Section 23 09 13 EMCS Basic Materials and Devices
2. Section 23 09 16 EMCS Operator Interfaces
3. Section 23 09 19 EMCS Field Panels
4. Section 23 09 23 EMCS Communication Devices
5. Section 23 09 26 EMCS Software and Programming
6. Section 23 09 29 EMCS Points and Sequence of Operation
7. Section 23 09 33 EMCS Commissioning

B. Coordination with other Divisions. The table in specification 23 00 10 paragraph 1.2-B shall be used to determine scope of work between Division 23 and other Divisions including Divisions 23 and 26. All work not specified to be a part of the EMCS scope of work shall be provided by General Contractor and associated subcontractors for each building and the infrastructure.

C. Testing and Commissioning

1. Section 01 91 00 Commissioning
2. Section 23 05 93 Testing, Adjusting and Balancing
3. Section 23 08 00 Mechanical Commissioning
4. Section 26 08 00 Electrical Commissioning

D. Communications

1. Connection to Using Agency IT WAN/LAN and terminations to wall jack shall be by Division 23C Contractor. Coordinate connection location of IT WAN/LAN and terminations with Using Agency. This connection shall also provide access to Internet through Using Agency firewall to Internet Services Provider procured by Using Agency.
2. Telephone lines: none required.

E. Integration with Existing System

1. Include all services required to integrate this building into existing EMCS for a fully operational system.

2. Procedure

a. Provide all controls work as indicated on drawings and in Section 23 09 29.
b. Develop all building level control system databases and control programming using existing standards and standard programming.
c. Install building databases and control programming on a temporary portable operator's terminal provided by the Contractor. The POT shall be used for start-up, testing, and commissioning. The POT shall remain the property of the Contractor after final completion of the project.
d. Once the building EMCS has been fully commissioned and accepted by the Using Agency, merge database and programming with those existing on the existing Operator Workstation and/or servers. Confirm that the merge was successful by sample testing points and sequences, and approve final installation in writing.
e. Integrate graphic screens into the existing EMCS graphics including adding appropriate hyperlinks so that the system operates as one integrated system.
f. Provide high level password for Using Agency operator access to the system only at this point; Using Agency will not have access to the system prior to system acceptance and integrations.

1.4 REFERENCE STANDARDS

A. Nothing in Contract Documents shall be construed to permit Work not conforming to applicable laws, ordinances, rules, and regulations. When Contract Documents differ from requirements of applicable laws, ordinances, rules and regulations, EMCS contractor shall comply with documents establishing the more stringent requirement.

B. The latest published or effective editions, including approved addenda or amendments, of the following codes and standard shall apply to the EMCS design and installation as applicable.

C. State and Local Codes:

1. Local City and County Codes

D. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

1. ASHRAE 135: BACnet - A Data Communication Protocol for Building Automation and Control Networks.

E. Electronics Industries Alliance

1. EIA-232: Interface Between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange.
2. EIA-458: Standard Optical Fiber Material Classes and Preferred Sizes
3. EIA-485: Standard for Electrical Characteristics of Generator and Receivers for use in Balanced Digital Multipoint Systems.
4. EIA-472: General and Sectional Specifications for Fiber Optic Cable
5. EIA-475: Generic and Sectional Specifications for Fiber Optic Connectors and all Sectional Specifications
6. EIA-573: Generic and Sectional Specifications for Field Portable Polishing Device for Preparation Optical Fiber and all Sectional Specifications
7. EIA-590: Standard for Physical Location and Protection of Below-Ground Fiber Optic Cable Plant and all Sectional Specifications

F. Underwriters Laboratories

1. UL 916: Energy Management Systems.

G. NEMA Compliance

1. NEMA 250: Enclosure for Electrical Equipment
2. NEMA ICS 1: General Standards for Industrial Controls.

H. NFPA Compliance

1. NFPA 90A "Standard for the Installation of Air Conditioning and Ventilating Systems" where applicable to controls and control sequences.

I. Institute of Electrical and Electronics Engineers (IEEE)

1. IEEE 142: Recommended Practice for Grounding of Industrial and Commercial Power Systems
2. IEEE 802.3: CSMA/CD (Ethernet – Based) LAN
3. IEEE 802.4: Token Bus Working Group (ARCNET – Based) LAN

1.5 DEFINITIONS

A. Acronyms

AAC	Advanced Application Controller
AH	Air Handler
AHU	Air Handling Unit
AI	Analog Input
ANSI	American National Standards Institute
AO	Analog Output
APDU	Application Protocol Data Unit
ASC	Application Specific Controllers

ASCII	American Standard Code for Information Interchange
ASHRAE	American Society of Heating, Refrigeration and Air Conditioning Engineers.
ASME	American Society of Mechanical Engineers.
ASTM	American Society for Testing and Materials.
A-to-D	Analog-to-Digital
BACnet	Data Communications Protocol for Building Automation and Control Systems
BC	Building Controller
BIBB	BACnet Interoperability Building Blocks
BMA	BACnet Manufacturers Association \
CAD	Computer Aided Drafting
CHW	Chilled Water
CHWR	Chilled Water Return
CHWS	Chilled Water Supply
COV	Change of Value
CSS	Control Systems Server
CU	Controller or Control Unit
CV	Constant Volume
CW	Condenser Water
CWR	Condenser Water Return
CWS	Condenser Water Supply
DCS	Digital Control Stations
DBMS	Database Management System
DDC	Direct Digital Control
DHW	Domestic Hot Water
DI	Digital Input
DO	Digital Output
D-to-A	Digital-to-Analog
EMCS	Energy Management and Control System

SSL	Secure Socket Layers
TAB	Test, Adjust, and Balance
TDR	Time Delay Relay
THS	Trend Historian Server
UL	Underwriters' Laboratories, Inc.
XML	Extensible Markup Language

B. Terms

Term	Definition
Accessible	Locations that can be reached with no more than a ladder to assist access and without having to remove permanent partitions or materials. Examples include inside mechanical rooms, mechanical equipment enclosures, instrument panels, and above suspended ceilings with removable tiles.
Advanced Application Controller	A device with limited resources relative to the Building Controller. It may support a level of programming and may also be intended for application specific applications.
Application Protocol Data Unit	A unit of data specified in an application protocol and consisting of application protocol control information and possible application user data (ISO 9545).
Application Specific Controller	A device with limited resources relative to the Advanced Application Controller. It may support a level of programming and may also be intended for application-specific applications. .
BACnet Interoperability Building Blocks	A BIBB defines a small portion of BACnet functionality that is needed to perform a particular task. BIBBs are combined to build the BACnet functional requirements for a device in a specification.
BACnet/BACnet Standard	BACnet communication requirements as defined by the latest version of ASHRAE/ANSI 135 and approved addenda.
Building Controller	A fully programmable device capable of carrying out a number of tasks including control and monitoring via direct digital control of specific systems, acting as a communications router between the LAN backbone and sub-LANs, and data storage for trend information, time schedules, and alarm data.
Change of Value	An event that occurs when a digital point changes value or an analog value changes by a predefined amount
Client	A device that is the requestor of services from a server. A client device makes requests of and receives responses from a server device.
Concealed	Embedded in masonry or other construction, installed in furred

	spaces, within double partitions or hung ceilings, in trenches, in crawl spaces, or in enclosures.
Continuous Monitoring	A sampling and recording of a variable based on time or change of state (e.g. trending an analog value, monitoring a binary change of state).
Contract Documents	Specifications, drawings, and other materials provided with request for bids.
Contractor, EMCS Contractor, or Division 23C Contractor	The Contractor retained by Using Agency to execute the work defined in Division 23C and associated design documents
Control Systems Server	A computer (or computers) that maintains the systems configuration and programming database.
Controller or Control Unit	Intelligent stand-alone control panel. Controller is a generic reference and shall include BCs, AACs, and ASCs as appropriate.
Digital Control Stations	One or more EMCS control panels
Direct Digital Control	Microprocessor-based control including Analog/Digital conversion and program logic
Energy Management and Control System	The entire integrated management and control system
Equal	Approximately equal in material types, weight, size, design, quality, and efficiency of specified product.
Exposed	Not installed underground or concealed.
Extensible Markup Language	A specification developed by the World Wide Web Consortium. XML is a pared-down version of SGML, designed especially for Web documents. It allows designers to create their own customized tags, enabling the definition, transmission, validation, and interpretation of data between applications and between organizations.
Functional Profile	A collection of variables required to define a the key parameters for a standard application. As this applies to the HVAC industry, this would include applications like VAV terminal, fan coil units, and the like.
Gateway	Bi-directional protocol translator connecting control systems that use different communication protocols
Hand Held Device	Manufacturer's microprocessor based device for direct connection to a Controller.
Inaccessible	Locations that do not meet the definition of accessible. Examples include inside furred walls, pipe chases and shafts, or above ceilings without removable tiles.
Indicated, shown or noted	As indicated, shown or noted on drawings or specifications.
Install	To erect, mount and connect complete with related accessories.
Instrumentation	Gauges, thermometers and other devices mounted in ductwork or piping that are not a part of the automatic temperature control system
IT LAN	Reference to the facility's Information Technology network, used for normal business-related e-mail and Internet communication.
LAN Interface Device	Device or function used to facilitate communication and sharing of data throughout the EMCS
Local Area Network	General term for a network segment within the architecture.
Supervisory LAN	Ethernet-based LAN connecting Primary Controller LANs with each other and OWSs, CSS, and THS. See System Architecture below.
Master-Slave/Token	Data link protocol as defined by the BACnet standard.

Passing	
Motor Controllers	Manual or magnetic starters (with or without switches), individual pushbuttons or hand-off-automatic (HOA) switches controlling the operation of motors.
Open Database Connectivity	An open standard application-programming interface for accessing a database developed. ODBC compliant systems make it possible to access any data from any application, regardless of which database management system is handling the data.
Operator Interface	A device used by the operator to manage the EMCS including OWSs, POTs, and HHDs.
Operator Workstation	The user's interface with the EMCS system. As the EMCS network devices are stand-alone, the OWS is not required for communications to occur.
Piping	Pipe, tube, fittings, flanges, valves, controls, strainers, hangers, supports, unions, traps, drains, insulation, and related items.
Points	All physical I/O points, virtual points, and all application program parameters.
Point-to-Point	Serial communication as defined in the BACnet standard.
Portable Operators Terminal	Laptop PC used both for direct connection to a controller and for remote dial up connection.
Primary Controlling LAN	High speed, peer-to-peer controller LAN connecting BCs and optionally AACs and ASCs. Refer to System Architecture below.
Protocol Implementation Conformance Statement	A written document, created by the manufacturer of a device, which identifies the particular options specified by BACnet that are implemented in the device (ASHRAE/ANSI 135).
Provide	To supply, install and connect up complete and ready safe and regular operation of particular work referred to unless specifically noted.
Reviewed, approved, or directed	As reviewed, approved, or directed by the Using Agency.
Router	A device that connects two or more networks at the network layer.
Secondary Controlling LAN	LAN connecting AACs and ASCs. Generally lower speed and less reliable than the Primary Controlling LAN. Refer to System Architecture below.
Server	A device that is a provider of services to a client. A client device makes requests of and receives responses from a server device.
Smart Device	A control I/O device such as a sensor or actuator that can directly communicate with the controller network to which it is connected. This differs from an ASC in that it typically deals only with one variable.
Standardized Query Language	A standardized means for requesting information from a database.
Supply	To purchase, procure, acquire and deliver complete with related accessories.
Trend Historian Server	A computer (or computers) that maintains the database of recorded trend logs.
Using Agency	Owner, University, Institution and/or its designated representatives.
Wiring	Raceway, fittings, wire, boxes and related items.
Work	Labor, materials, equipment, apparatus, controls, accessories, and other items required for proper and complete installation.

1.6 QUALITY ASSURANCE

A. Materials and Equipment

1. Manufacturer's Qualifications: See 2.01 for approved manufacturer.
2. Product Line Demonstrated History: The direct digital control equipment product line being proposed for the project must have an installed history of demonstrated satisfactory operation for a length of one year since date of final completion in at least 10 installations of comparative size and complexity.
3. All products used in this project installation shall be new, currently under manufacture, and shall have been available from the manufacturer for a minimum of 6 months prior to date of proposal and previously installed and proven effective in installations of similar nature, not including test sites. This installation shall not be used as a test site for any new products unless explicitly approved by the Using Agency in writing. Spare parts shall be available for at least five years after completion of this contract.
4. All BACnet devices must either be certified as complaint with BACnet through the BACnet Manufacturers Association or the vendor must supply proof of having submitted the device for testing by BMA.
5. The EMCS and components shall be listed by Underwriters Laboratories UL 916 as an Energy Management System.

B. Installer

1. EMS Contractor's Project Manager Qualifications: Individual shall specialize in and be experienced with direct digital control system installation for not less than 3 years. Project Manager shall have experience with the installation of the proposed direct digital control equipment product line for not less than 2 projects of similar size and complexity. Project Manager must have proof of having successfully completed the most advanced training offered by the manufacturer of the proposed product line.
2. EMS Contractor's Programmer Qualifications: Individual(s) shall specialize in and be experienced with direct digital control system programming for not less than 3 years and with the proposed direct digital control equipment product line for not less than 1.5 years. Programmers must show proof of having successfully completed the most advanced programming training offered by the vendor of the programming application on the proposed product line.
3. EMS Contractor's Service Qualifications: The installer must be experienced in control system operation, maintenance and service. EMS Contractor must document a minimum 5-year history of servicing installations of similar size and complexity. Installer must also document at least a 1-year history of servicing the proposed product line.
4. Installer’s Response Time and Proximity

    a. Installer must maintain a fully capable service facility within Mississippi. Service facility shall manage the emergency service dispatches and maintain the inventory of spare parts.
    b. Installer must demonstrate the ability to meet the emergency response times listed in paragraph 1.12B.2.

5. Electrical installation shall be by manufacturer-trained electricians.

    a. Exception: Roughing in wiring/conduit and mounting panels may be subcontracted to any licensed electrician.

1.7 SUBMITTALS

A. No work may begin on any segment of this project until the related submittals have been reviewed for conformity with the design intent and the Contractor has responded to all comments to the satisfaction of the resentative.

B. Submit drawings, product data, samples and certificates of compliance required as hereinafter specified. See also Division 1 Shop Drawings, Product Data and Samples. Conditions in this Section take precedence over conditions in above referenced Section.

C. Submittal Schedule: Submittal schedule shall be as follows unless otherwise directed by the Using Agency:

1. Allow 10 working days for approval, unless Professional agrees to accelerated schedule.
2. Submittal Package 1 (Hardware and Shop Drawings) shall be submitted in accordance with schedule established by the Using Agency in bid documents.
3. Submittal Package 2 (Programming and Graphics) and shall be submitted no less than 30 days before software is to be installed in field devices.
4. Submittal Package 3 (Functional Testing) shall be submitted no less than 30 days prior to conducting tests.
5. Submittal Package 4 (Training Materials) shall be submitted no less than 14 days prior to conducting first training class.
6. Submittal Package 5 (Post-Construction Trend Logs) shall be submitted after demonstration tests are accepted and systems are in full automatic operation. The list of points to be trended shall be submitted for approval 14 days prior to the start of the trend collection period.
7. Submittal Package 6 (End-of-Warranty Trend Logs) shall be submitted 30 days prior to the end of the warranty period.

D. Submission and Resubmission Procedure:

1. Each submittal shall have a unique serial number that includes the associated specification section followed by a number for each sub-part of the submitted for that specification section, such as SUBMITTAL 230900-01.
2. Each resubmittal shall have the original unique serial number plus unique revision number such as SUBMITTAL 230900-01 REVISION 1.
3. Submit one copy of submittal in electronic format specified under each submittal package below. Submissions made in the wrong format will be returned without action.
4. Submit two (2) and only two hardcopies copies of submittals to Professional for review. Any additional copies will be returned without review.
5. Professional will return one copy with comments and corrections noted where required.
6. Make corrections:

    a. Revise initial drawings or data.
    b. Indicate any changes that have been made other than those requested.
    c. Clearly identify resubmittal by original submittal number and revision number.

7. Resubmit two (2) and only two copies of revised submittals to Professional for review until no exceptions are taken.
8. Once submittals are accepted and stamped with no exceptions taken, Contactor shall make photocopies for coordination with other trades, as required by the General Contractor. Photocopies will serve as submittal for record and coordination.

E. Submittals Packages

1. Submittal Package 1 (Hardware and Shop Drawings)

a. Provide Installer and Key personnel qualifications as specified.
b. Hardware

(1) Organize by specification section and device tags as tagged in these specifications.
(2) Do not submit products that are not used even if included in specifications.
(3) Include a summary table of contents listing for every submitted device:

a) Tab of submittal file/binder where submittal is located
b) Device tag as tagged in these specifications (such as TS-1A, FM-1)
c) Specification section number (down to the lowest applicable heading number)
d) Whether device is per specifications and a listed product or a substitution
e) Manufacturer
f) Model Number
g) Device accuracy (where applicable)
h) Accuracy as installed including wiring and A/D conversion effects (where applicable)

(4) Submittal shall include manufacturer's description and technical data, such as performance data, product specification sheets, and installation instructions for all control devices and software.
(5) When manufacturer's cut-sheets apply to a product series rather than a specific product, the data specifically applicable to the project shall be highlighted or clearly indicated by other means. Each submitted piece of literature and drawings shall clearly reference the specification and/or drawing that the submittal is to cover. General catalogs shall not be accepted as cut sheets to fulfill submittal requirements.
(6) A BACnet_ Protocol Implementation Conformance Statement (PICS) for each type of controller and operator interface shall be included submittals.
(7) Format: Electronic word-searchable format.

c. Shop Drawings

(1) Format:

a) Sheets shall be consecutively numbered.
b) Each sheet shall have a title indicating the type of information included and the mechanical/electrical system controlled.
c) Table of Contents listing sheet titles and sheet numbers.
d) Legend and list of abbreviations.
e) Schematics

1) AutoCAD or Visio compatible format.
2) 21 inch x 15 inch or 17 inch x 11 inch.

f) Floor plans: None required

(2) System architecture one-line diagram indicating schematic location of all control units, workstations, LAN interface devices, gateways, etc. Indicate address and type for each control unit. Indicate media, protocol, baud rate, and type of each LAN.
(3) Schematic flow diagram of each air and water system showing fans, coils, dampers, valves, pumps, heat exchange equipment and control devices. The

schematics provided with bid package shall be the basis on the EMCS Contractor's schematics with respect to control points, but EMCS Contractor may use alternative graphics format.

(4) All physical points on the schematic flow diagram shall be indicated with names, descriptors, and point addresses identified as listed in the point summary table.

(5) With each schematic, provide a point summary table listing building number and abbreviation, system type, equipment type, full point name, point description, Ethernet backbone network number, network number, device ID, object ID (object type, instance number). See Section 23 09 26 - Part 3 for additional requirements.

(6) Label each control device with setting or adjustable range of control.

(7) Label each input and output with the appropriate range.

(8) Device table (Bill of Materials). With each schematic, provide a table of all materials and equipment including:

a) Device tag as indicated in the schematic and actual field labeling (use tag as indicated in these specifications where applicable and practical)
b) Device tag as indicated in these specifications where applicable and if it differs from schematic device tag
c) Description
d) Quantity
e) Proposed manufacturer and model number
f) Range

(9) With each schematic or on separate valve sheet, provide valve and actuator information including size, C_v, design flow, target pressure drop, actual design pressure drop, manufacturer, model number, close off rating, etc. Indicate normal positions of spring return valves and dampers.

(10) Indicate all required electrical wiring. Electrical wiring diagrams shall include both ladder logic type diagram for motor starter, control, and safety circuits and detailed digital interface panel point termination diagrams with all wire numbers and terminal block numbers identified. Provide panel termination drawings on separate drawings. Ladder diagrams shall appear on system schematic. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.

(11) Details of control panels, including controls, instruments, and labeling shown in plan or elevation indicating the installed locations.

d. Do not include sequence of controls on shop drawings or equipment submittals; they are included in Submittal Package 2.

e. Submit along with shop drawings but under separate cover memory allocation projections and calculated and guaranteed response times of the most heavily loaded LAN in the system.

2. Submittal Package 2 (Programming and Graphics)

a. A detailed description of point naming convention conforming to Section 23 09 26 to be used for all software and hardware points, integrated with existing database convention.

b. A list of all hardware and software points identifying their text names, device addresses and descriptions.

c. Control Logic Documentation

(1) Submit control logic program listings (graphical programming) consistent with specified English-language Sequences of Operation for all control units.

(2) Control logic shall be annotated to describe how it accomplishes the sequence of operation. Annotations shall be sufficient to allow an operator to relate each program component (block or line) to corresponding portions of the specified Sequence of Operation.
(3) Include specified English-language Sequences of Operation of each control sequence updated to reflect any suggested changes made by the Contractor to clarify or improve the sequences. Changes shall be clearly marked. SOO shall be fully consistent with the graphical programming. (An electronic version of the sequences of controls in Section 23 09 29 will be provided to the Contractor upon request.)
(4) Include control settings, setpoints, throttling ranges, reset schedules, adjustable parameters and limits.
(5) Submit one complete set of programming and operating manuals for all digital controllers concurrently with control logic documentation. This set will count toward the required number of Operation and Maintenance materials specified below.

d. Graphic screens of all required graphics, provided in final colors, one 11” x 8.5” page per screen.
e. Format

(1) Points list: Word-searchable format per Paragraph 1.8C.3.
(2) Programming: Native electronic file if interpreter is available, otherwise provide pdf files of screen shots.
(3) Programming and operating manual: Word-searchable format per Paragraph 1.8C.3.
(4) Graphics: Graphical electronic format (pdf, png, etc.).

3. Submittal Package 3 (Functional Testing)

a. Provide pre-functional test forms as required by Section 23 09 33.
b. Provide functional test forms as required by Section 23 09 33.
c. Format: Word-searchable format per Paragraph 1.8C.3.

4. Submittal Package 4 (Training Materials)

a. Provide training materials as required by Section 23 09 33.
b. Format: Word-searchable format per Paragraph 1.8C.3.

5. Submittal Package 5 and 6 (Trend Logs)

a. Provide a list of points being trended along with trend interval or change-of-value per Section 23 09 29.
b. Provide trend logs as required by Section 23 09 29.
c. Format: See Section 23 09 26.

1.8 COMPLETION REQUIREMENTS

A. Procedure.

1. Until the documents required in this section are submitted and approved, the system will not be considered “accepted” and final payment to EMCS Contractor will not be made.
2. Before requesting acceptance of work, submit one set of completion documents for review and approval of Using Agency.

3. After review, furnish quantity of sets indicated below to Using Agency.

B. Completion Documents:

1. Operation and Maintenance (O & M) Manuals. Provide in both paper and electronic format per paragraph 1.8C.

    a. Include all submittals (product data, shop drawings, control logic documentation, hardware manuals, software manuals, installation guides or manuals, maintenance instructions and spare parts lists) in maintenance manual; in accordance with requirements of Division 1.
    b. As-built versions of the submittal product data. Submittal data shall be located in tabs along with associated maintenance information.
    c. Engineering, Installation, and Maintenance Manual(s) that explain how to design and install new points, panels, and other hardware; preventive maintenance and calibration procedures; how to debug hardware problems; and how to repair or replace hardware.
    d. Complete original issue documentation, installation, and maintenance information for all third-party hardware and software provided, including computer equipment and sensors.
    e. A list of recommended spare parts with part numbers and suppliers.
    f. Operators Manual with procedures for operating the control systems, including logging on/off, alarm handling, producing point reports, trending data, overriding computer control, and changing set points and other variables.
    g. Programming Manuals with a description of the programming language, control block descriptions (including algorithms and calculations used), point database creation and modification, program creation and modification, and use of the programming editor.
    h. Recommended preventive maintenance procedures for all system components, including a schedule of tasks (inspection, cleaning, calibration, etc.), time between tasks, and task descriptions.
    i. A listing and documentation of all custom software for the project created using the programming language, including the set points, tuning parameters, and point and object database.
    j. English language control sequences updated to reflect final programming installed in the EMCS at the time of system acceptance.

2. Complete original issue diskettes/CDs for all software provided, including operating systems, programming language, operator workstation software, and graphics software.
3. Project Record Drawings.

    a. “As-built” versions of the submittal drawings in reproducible paper and electronic format per paragraph 1.8C.
    b. Provide as-built network architecture drawings showing all BACnet nodes including a description field with specific controller/device identification, description and location information.
    c. Record floor plans with controller locations with all interconnecting wiring routing including space sensors, LAN wiring, power wiring, low voltage power wiring. Indicate device instance, address and drawing reference number.

4. Commissioning Reports. Completed versions of all Pre-functional, Functional, and Demonstration Commissioning Test reports, calibration logs, etc., per Section 23 09 33.
5. Copy of inspection certificates provided by the local code authorities.
6. Written guarantee and warranty documents for all equipment and systems, including the start and end date for each.
7. Training materials as required by Section 23 09 33.
8. Contact information. Names, addresses, and 24-hour telephone numbers of contractors

installing equipment, and the control systems and service representatives of each.

C. Format of Completion Documents

1. Provide the type and quantity of media listed in table below.
2. Documents such as manuals and control sequences shall be in word-searchable electronic format such as MS Word, Adobe Acrobat (pdf), and HTML and broken into separate files for each type of equipment. Record drawings shall be in original format per paragraph 1.06F.
3. Optical media shall be readable on Operator Workstations.

	Document	Paper (binder or bound)	Electronic	
			Read only optical disk	Loaded onto OWSs and POTs
1.	O&M Manual	5	1	1
2.	Original issue software	–	1 per workstation	1
3.	Project Record Drawings	5	1	1
4.	Control sequences	1	1	1
5.	Commissioning Reports	5	–	–
6.	Inspection Certificates	1	–	–
7.	Warranty documents	1	–	–
8.	Training materials	1 per trainee	–	–
9.	Contact information	1	–	1

D. Permanent On-site Documentation:

1. In panels, provide point list of all points in panel in sufficiently permanent manner that list cannot be easily removed (and lost).
2. Mount half size drawings of primary system schematics and network architecture in glass covered frame. The number of drawings will depend on the complexity of the system; compressed or abridged versions of shop drawings are acceptable provided all control points are shown. Mount the drawings in space available in mechanical rooms. Drawings may be mounted in different locations, e.g. air handler schematic may be in fan room, chiller schematic in chiller room, etc.

1.9 SYSTEM ARCHITECTURE

A. General

1. The system provided shall incorporate hardware resources sufficient to meet the functional requirements of these Specifications. The Contractor shall include all items not specifically itemized in these Specifications that are necessary to implement, maintain, and operate the system in compliance with the functional intent of these Specifications.
2. The control system shall consist of a high-speed, peer-to-peer network of DDC controllers, a control system server, and an operator workstation capable of expansion as specified herein.
3. System software shall be based on a server/thin-client architecture, designed around the open standards of web technology. The control system server shall be accessed using a Web browser over the control system network, the Using Agency's local area network, and remotely over the Internet (through the Using Agency's LAN).
4. The intent of the thin-client architecture is to provide operators complete access to the control system via a Web browser. No special software other than a Web browser shall be required

to access graphics, point displays, and trends, configure trends, configure points and controllers, or to edit programming.

5. Performance Monitoring. The EMCS will provide the specified performance monitoring functionality, including required monitoring points and performance metrics, improved through system accuracy, data acquisition and data management capabilities, and required graphical and data displays.
6. Event Response. The EMCS will provide the specified operational changes based on event response from the energy service provider.
7. All control products provided for this project shall comprise an interoperable fully-native BACnet system, including all communication media, connectors, repeaters, hubs, and routers necessary for the network. All control products provided for this project shall conform to ANSI/ASHRAE Standard 135.

B. EMCS network architecture.

1. Supervisory LAN: The LAN shall be an Ethernet-based, 100/1000 Mbps network connecting the control system servers and OWSs to routers in each building. Contractor shall utilize the Using Agency's Enterprise IT LAN/WAN for this purpose. This network shall be BACnet/IP as defined in Addendum A (Annex J) of the BACnet standard, and shall share a common network number for the Ethernet backbone, as defined in BACnet.
2. Primary Controller LAN (Primary LAN): High-speed, peer-to-peer communicating LAN used to connect AACs, ASCs and BCs and communicate exclusively control information. Acceptable technologies include:

    a. Ethernet (IEEE 802.3)

3. Secondary Controller LAN (Secondary LAN or sub LAN): Network used to connect AACs and ASCs. These can be Master Slave/ Token Passing or polling, in addition to those allowed for Primary Controller LANs. Network speed vs. the number of controllers on the LAN shall be dictated by the response time and trending requirements.

C. Operator Interfaces and Servers:

1. Control Systems Server (CSS). This shall be a server upon which the systems configuration and programming databases are maintained and serves as web server for operator interface. It shall hold the backup files of the information downloaded into the individual controllers and as such support uploading and downloading that information directly to/from the controllers. It shall also act as a control information server to non-control system based programs. It shall allow secure multiple-access to the control information.
2. The Operator Workstations and Portable Operator Terminals shall provide for overall system supervision, graphical user interface, management report generation, and alarm annunciation.
3. Remote monitoring and control shall be through use of a web browser through the Using Agency's IT LAN and via the internet through the Using Agency's IT LAN.
4. The operator interface and server already exist. Modify existing hardware and software as needed for the project.

D. Controllers. The BCs, AACs, and ASCs shall monitor, control, and provide the field interface for all points specified. Each BC, AAC, or ASC shall be capable of performing all specified energy management functions, and all DDC functions, independent of other BCs, AACs, or ASCs and operator interface devices.

E. Gateways:

1. Gateways shall be provided only as required for connection to the following:

a. Electrical Power System Controls
b. Variable Speed Drive Controls
c. Lighting Control
d. Boilers

2. Where gateways are used, critical points shall be hard-wired from the DDC system to the controlled device, rather than using the gateway, to avoid problems with gateway failures, currently a common problem. Critical points are those that are essential for proper operation and are listed in points list as separate points. Where listed, these points shall be hard-wired even when available through gateway.

1.10 SYSTEM PERFORMANCE

A. The communication speed between the controllers, LAN interface devices, and operator interface devices shall be sufficient to ensure fast system response time under any loading condition. This includes when system is collecting trend data for commissioning and for long term monitoring. (See Section 23 09 33.) In no case shall delay times between an event, request, or command initiation and its completion be greater than those listed herein, assuming no other simultaneous operator activity. Contractor shall reconfigure LAN as necessary to accomplish these performance requirements. This does not apply to gateways and their interaction with non-EMCS-vendor equipment.

1. Object Command. The maximum time between an operator command via the operator interface to change an analog or binary point and the subsequent change in the controller shall be less than 5 seconds.
2. Object Scan. All changes of state and change of analog values will be transmitted over the network such that any data used or displayed at a controller or workstation will have been current within the previous 10 seconds.
3. Graphics Scan. The maximum time between an operator's selection of a graphic and it completely painting the screen and updating at least 10 points shall be less than 10 seconds.
4. Alarm Response Time. The maximum time from when an object goes into alarm to when it is annunciated at the workstation or broadcast to pager (where so programmed) shall not exceed 10 seconds for a Level 1 or 2 alarm, 20 seconds for alarm levels 2 and 3, and 30 seconds for alarm levels 4 and 5. All workstations on the onsite network must receive alarms within 5 seconds of each other.
5. Program Execution Frequency. Custom and standard applications shall be capable of running as often as once every 5 seconds. The EMCS Contractor shall be responsible for selecting execution times consistent with the mechanical process under control.
6. Control Loop Performance. Programmable controllers shall be able to execute DDC PID control loops at a selectable frequency of at least once per second. The controller shall scan and update the process value and output generated by this calculation at this same frequency.

1.11 OWNERSHIP OF PROPRIETARY MATERIAL

A. All project-developed software and documentation shall become the property of the Using Agency. These include, but are not limited to:

1. Project graphic images
2. Record drawings
3. Project database
4. Project-specific application programming code

5. All documentation

1.12 WARRANTY

A. In accordance with Division 1 Guarantees, Warranties, Bonds, Service & Maintenance Contracts, and as follows.

B. At the successful completion of the final testing, commissioning, and demonstration phase in accordance with the terms of this specification, if equipment and systems are operating satisfactorily to the Using Agency and if all completion requirements per paragraph 1.07 have been fulfilled, the Using Agency shall certify in writing that the control system has been accepted. The date of acceptance shall be the start of the warranty period.

C. Guarantee all materials, equipment, apparatus and workmanship (including programming) to be free of defective materials and faulty workmanship for period of one year from date of acceptance.

1. Valve and damper actuators shall carry a manufacturer’s 5-year warranty.

D. Provide new materials, equipment, apparatus and labor to replace that determined by Using Agency to be defective or faulty.

E. Control system failures during the warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to the Using Agency. The EMCS Contractor shall respond to the Using Agency's request for warranty service within 24 hours during normal business hours.

F. Operator workstation software, project-specific software, graphic software, database software, and firmware updates that resolve known software deficiencies as identified by the EMCS Contractor shall be provided at no charge during the warranty period. Software bugs (both due to programming misinterpretations and sequence errors) shall be corrected and any reasonable control sequence changes required to provide proper system operation shall also be provided at no additional cost during this period.

1.13 WARRANTY MAINTENANCE

A. The Using Agency reserves the right to make changes to the EMCS during the warranty period. Such changes do not constitute a waiver of warranty. The Contractor shall warrant parts and installation work regardless of any such changes made by the Using Agency, unless the Contractor provides clear and convincing evidence that a specific problem is the result of such changes to the EMCS.

B. At no cost to the Using Agency, during the warranty period, the Contractor shall provide maintenance services for software and hardware components as specified below:

1. Maintenance services shall be provided for all devices and hardware specified in Division 23C. Service all equipment per the manufacturer’s recommendations.
2. Emergency Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would result in property damage or loss of comfort control shall be corrected and repaired following telephonic notification by the Using Agency to the Contractor.

a. Response by telephone or via internet connection to the EMCS to any request for service shall be provided within two hours of the Using Agency's initial telephone request for service.

b. In the event that the malfunction, failure, or defect is not corrected through the telephonic communication, at least one hardware and software technician, trained in the system to be serviced, shall be dispatched to the Using Agency's site within eight hours of the Using Agency's initial telephone request for such services, as specified.

3. Normal Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would not result in property damage or loss of comfort control shall be corrected and repaired following telephonic notification by the Using Agency to the Contractor.

   a. Response by telephone to any request for service shall be provided within eight working hours (contractor specified 40 hr per week normal working period) of the Using Agency's initial telephone request for service.
   b. In the event that the malfunction, failure, or defect is not corrected through the telephonic communication, at least one hardware and software technician, trained in the system to be serviced, shall be dispatched to the Using Agency's site within three working days of the Using Agency's initial telephone request for such services, as specified.

4. Using Agency’s Telephonic Request for Service: Contractor shall specify a maximum of three telephone numbers for Using Agency to call in the event of a need for service. At least one of the lines shall be attended continuously (24/7). Alternatively, pagers can be used for technicians trained in system to be serviced. One of the three paged technicians shall respond to every call within 15 minutes.
5. Technical Support: Contractor shall provide technical support by telephone throughout the warranty period.
6. Preventive maintenance shall be provided throughout the warranty period in accordance with the hardware component manufacturer's requirements.
7. Record drawings and software documentation shall be updated as required to reflect any and all changes made to the system or programming during the warranty period.

PART 2 - PRODUCTS

2.1 MANUFACTURERS (PRODUCT LINE)

A. Johnson Controls (Metasys)

B. Johnson Controls (Facilities Explorer)

C. Trane (Tracer SC)

D. Siemens (Apogee)

E. Honeywell (ComfortPoint)

2.2 MATERIALS AND EQUIPMENT

A. Materials shall be new, the best of their respective kinds without imperfections or blemishes and shall not be damaged in any way.

B. To the extent practical, all equipment of the same type serving the same function shall be identical and from the same manufacturer

PART 3 - EXECUTION

3.1 COORDINATION

A. The Contractor shall coordinate work schedule with Professional to complete project on schedule without disruption or delays.

B. The Contractor shall coordinate work with other trades prior to construction.

C. Examine areas and conditions under which control systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.2 INSTALLATION

A. Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details shown on drawings.

B. Refer to additional requirements in other Sections of this specification.

3.3 DIGITAL CONTROL STATIONS

A. Individual Digital Control Stations referenced on drawings to indicate allocation of points to each DCS and DCS location. Digital control stations shall consist of one or multiple controllers to meet requirements of this specification. It is the Contractor's responsibility to provide enough controllers to ensure a completely functioning system, according to the point list and sequence of operations.

B. Where a DCS is referenced, Contractor shall provide at least one (1) controller, and additional controllers as required, in sufficient quantity to meet the requirements of this Specification. Restrictions in applying controllers are specified in Section 23 09 19 - EMCS Field Panels.

C. Contractor is responsible for ensuring DCSs do not interfere with other requirements of the project and maintain adequate clearance for maintenance access.

D. DCSs have not been located. The Contractor shall locate DCSs in electrical rooms, mechanical rooms, and adjacent to rooftop equipment where space is available.

E. Contractor is responsible for ensuring DCSs do not interfere with other requirements of the project and maintain adequate clearance for maintenance access.

3.4 CONTROL POWER

A. Division 23C Contractor shall extend power to all EMCS devices, including 120V power to panels, from an acceptable power panel.

1. See Division 26 Electrical drawings for power locations pre-allocated for EMCS system.
2. Where no power source is shown, for bid purposes only, assume a dedicated circuit is available within an average of 50 feet of panel location. If this is not the case, request additional cost prior to submission of shop drawings or no additional costs will be reimbursed.
3. Coordinate with Division 26 during shop drawing development for final connection location.

B. General requirements for obtaining power include the following:

1. Obtain power from a source that feeds the equipment being controlled such that both the control component and the equipment are powered from the same panel. Where equipment is powered from a 460V source, obtain power from the electrically most proximate 120v source fed from a common origin.
2. Where control equipment is located inside a new equipment enclosure, coordinate with the equipment manufacturer and feed the control with the same source as the equipment. If the equipment's control transformer is large enough and of the correct voltage to supply the controls, it may be used. If the equipment's control transformer is not large enough or of the correct voltage to supply the controls, the Contractor shall provide separate transformer(s).
3. Where a controller controls multiple systems on varying levels of power reliability (normal, emergency, and/or interruptible), the controller shall be powered by the highest level of reliability served.
4. Standalone Functionality: Refer to Section 23 09 19.

C. Power line filtering. Provide transient voltage and surge suppression for all workstations and controllers either internally or as an external component.

3.5 DELIVERY, STORAGE, AND HANDLING

A. Provide factory-shipping cartons for each piece of equipment and control device. Maintain cartons during shipping, storage and handling as required to prevent equipment damage, and to eliminate dirt and moisture from equipment.

B. Store equipment and materials inside and protect from weather.

3.6 IDENTIFICATION

A. General:

1. Manufacturers' nameplates and UL or CSA labels to be visible and legible after equipment is installed.
2. Identifiers shall match record documents.
3. All plug-in components shall be labeled such that removal of the component does not remove the label.

B. Wiring and Tubing:

1. All wiring and cabling, including that within factory-fabricated panels, shall be labeled at each end within 2" of termination with the DDC address or termination number.
2. Permanently label or code each point of field terminal strips to show the instrument or item served.
3. All pneumatic tubing shall be labeled at each end within 2" of termination with a descriptive identifier.

C. Equipment and Devices:

1. Valve and damper actuators: Provide 2" diameter brass tags and brass chains. Lettering shall be ½" high, stamped and painted black. Indicate unique valve or damper identifier from record drawings.
2. Sensors: Provide 1"x 3"x 1/8" black micarta or lamacoid labels with engraved white lettering, ¼" high. Indicate sensor identifier and function (e.g. "CHWS temp").

3. Panels: Provide 2"x 5" 1/8” black micarta or lamacoid labels with engraved white lettering, ½" high. Indicate panel identifier and service.
4. Identify room sensors relating to terminal box or valves with indelible marker on sensor hidden by cover.

3.7 CUTTING, CORING, PATCHING & PAINTING

A. The EMCS Contractor shall provide canning for openings in concrete walls and floors and other structural elements prior to their construction. Should any openings be missed, the EMCS Contractor shall be responsible for all cutting, coring, and patching that may be required for Division 23C work. Structural elements shall not be cut without the written consent of Using Agency.

B. Penetrations through rated walls or floors shall be filled with an approved material to provide a code compliant fire-stop.

C. All damage to and openings in ductwork, piping insulation, and other materials and equipment resulting from Division 23C work shall be properly sealed, repaired, and/or re-insulated by experienced mechanics of the trade involved. Repair insulation to maintain integrity of insulation and vapor barrier jacket. Use hydraulic insulating cement to fill voids and finish with material matching or compatible with adjacent jacket material.

D. At the completion of work, all equipment furnished under this section shall be checked for paint damage, and any factory-finished paint that has been damaged shall be repaired and repainted to original finish.

3.8 CLEANING

A. The EMCS Contractor shall clean up all debris resulting from its activities daily. The EMCS Contractor shall remove all cartons, containers, crates, etc., under its control as soon as their contents have been removed. Waste shall be collected and legally disposed of by EMCS Contractor.

B. Materials stored on-site shall be stored in an orderly manner, neatly stacked, or piled in the designated area assigned by the Professional.

C. At the completion of work in any area, the EMCS Contractor shall clean all of its work, equipment, etc., keeping it free from dust, dirt, and debris, etc.

D. The EMCS Contractor shall use only cleaning materials recommended by the manufacturer of the surfaces to be cleaned and on surfaces recommended by the cleaning material manufacturer.

3.9 FIELD QUALITY CONTROL

A. See Division1 Quality Control.

B. Perform tests as required by authorities having jurisdiction.

C. See 23 08 00 Mechanical Commissioning.

D. Repair or replace defective work, as directed by Professional in writing, at no additional cost to the Using Agency.

E. Restore or replace damaged work due to tests as directed by Professional in writing, at no additional cost to the Using Agency.

F. Restore or replace damaged work of others, due to tests, as directed by Professional in writing, at no additional cost to the Using Agency.

G. Remedial work shall be performed to the satisfaction of the Professional, at no additional cost to the Using Agency, including:

1. Work related to all Division 23C pre-functional, functional, and demonstration tests.
2. Division 23C work related to Section 23 05 93 Testing, Adjusting and Balancing.

H. Remedial work shall include performing any commissioning or other tests related to remedial work an additional time at no additional cost to the Using Agency.

END OF SECTION 23 09 00

SECTION 23 09 13 - EMCS BASIC MATERIALS AND DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. Provide and install the following:

1. Field devices including control valves, control dampers, sensors, etc.

B. Refer to Section 23 09 00 for general requirements.

C. Refer to Section 23 09 29 for points list and specific device requirements.

1.3 RELATED WORK AND REQUIREMENTS

A. Section 23 09 00 Energy Management and Control System (EMCS) − General

B. Section 23 09 16 EMCS Operator Interfaces

C. Section 23 09 19 EMCS Field Panels

D. Section 23 09 23 EMCS Communications Devices

E. Section 23 09 26 EMCS Software and Programming

F. Section 23 09 29 EMCS Points and Sequence of Operation

1.4 GENERAL

A. Sensor selection, wiring method, use of transmitters, A-to-D conversion bits, etc. shall be selected and adjusted to provide end-to-end (fluid to display) accuracy at or better than those listed in the following table.

Measured Variable	**Reported Accuracy**
Space drybulb temperature	±1ºF
Ducted Air drybulb temperature	±0.5ºF
Mixed Air drybulb temperature	±1ºF
Outside Air drybulb temperature	±0.5ºF
Hot Water Temperature	±1ºF
Hot/chilled Water Delta-T (supply to return) − general	±0.3ºF

Measured Variable	Reported Accuracy
Water Flow	±3% of full scale
Airflow (terminal)	±10% of full scale
Airflow (measuring stations)	±5% of full scale
Air Pressure (ducts)	±0.05”
Air Pressure (space)	±0.01”
Water Pressure	±2% of full scale
Electrical power	2% of reading
Carbon Dioxide (CO_2)	±75 ppm

B. The listing of several sensors or devices in each section of Part 2 does not imply that any may be used. Refer to points list in Section 23 09 29 for device specification. Only where two or more devices are specifically listed in points list (e.g. “FM-1 or FM-4”) may the contractor supply any of the listed products.

PART 2 - PRODUCTS

2.1 AIR TUBING

A. Seamless copper tubing, Type L-ACR, ASTM B 88; with cast-bronze solder joint fittings, ANSI B1.18; or wrought-copper solder joint fittings, ANSI B16.22; except brass compression-type fittings at connections to equipment. Solder shall be 95/5 tin antimony, or other suitable lead free composition solder.

B. Virgin polyethylene non-metallic tubing type FR, ASTM D 2737, and with flame-retardant harness for multiple tubing. Use compression or push-on brass fittings.

2.2 ELECTRIC WIRING AND DEVICES

A. General. All electrical work shall comply with Division 26.

B. Power Wiring:

1. Power wiring and wiring connections required for EMCS shall be provided under this section unless specifically shown on drawings or specified to be under Division 26. See Coordination section in Section 23 09 00.
2. See Control Power section of 23 09 00.

C. Communication Wiring:

1. Contractor shall supply all communication wiring between Building Controllers, Routers, Gateways, AAC’s, ASC’s and local and remote peripherals (e.g., operator workstations, printers, and modems).
2. Supervisory LAN: For any portions of this network required under this section of the specification, contractor shall use Fiber or Category 5 of standard TIA/EIA 68 (10baseT). Network shall be run with no splices and separate from any wiring over thirty (30) volts.
3. Primary and Secondary Controller LANs: Communication wiring shall be individually 100% shielded pairs per manufacturers recommendations for distances installed, with overall PVC cover, Class 2, plenum-rated run with no splices and separate from any wiring over thirty (30) volts. Shield shall be terminated and wiring shall be grounded as recommended by BC manufacturer.

D. Signal Wiring:

1. Signal wiring to all field devices, including, but not limited to, all sensors, transducers, transmitters, switches, etc. shall be twisted, 100% shielded pair, minimum 18-gauge wire, with PVC cover. Signal wiring shall be run with no splices and separate from any wiring above thirty (30) volts.
2. Signal wiring shield shall be grounded at controller end only unless otherwise recommended by the controller manufacturer.

E. Low Voltage Analog Output Wiring:

1. Low voltage control wiring shall be minimum 16-gauge, twisted pair, 100% shielded, with PVC cover, Class 2 plenum-rated. Low voltage control wiring shall be run with no splices separate from any wiring above thirty (30) volts.

2.3 CONTROL CABINETS:

A. All control cabinets shall be fully enclosed with hinged door, key-lock latch. A single key shall be common to all field panels and sub-panels within each building. Provide 3 keys.

B. Construction

1. Indoor: NEMA 1
2. Outdoor: NEMA 4

C. Interconnections between internal and face-mounted devices shall be pre-wired with color-coded stranded conductors neatly installed in plastic troughs and/or tie-wrapped. Terminals for field connections shall be UL Listed for service, individually identified per control/interlock drawings, with adequate clearance for field wiring. All control tubing and wiring shall be run neatly and orderly in open slot wiring duct with cover. Control terminations for field connection shall be individually identified per control drawings.

D. Provide ON/OFF power switch with over-current protection for control power sources to each local panel.

E. Provide with:

1. Framed, plastic-encased point list for all points in cabinet.
2. Nameplates for all devices on face.

2.4 CONTROL VALVES

A. Manufacturers

1. Belimo
2. Siemens
3. Johnson Controls
4. Invensys
5. Delta
6. Warren
7. Or equal

B. Plug-Type Globe Pattern for Water Service:

1. Valves shall have cage-type trim, providing seating and guiding surfaces for plug on 'top-and-bottom' guided plugs.
2. Temperature Rating: 25□F minimum, 250□F maximum
3. Body:

    a. Bronze, screwed for 1/2" to 2".
    b. Cast Iron, flanged for 2-1/2" and larger.

4. Valve Trim: Bronze; Stem: Polished stainless steel.
5. Packing: Spring Loaded Teflon or Synthetic Elastomer U-cups, self-adjusting.
6. Plug: Brass, bronze or stainless steel, Seat: Brass
7. Disc: Replaceable Composition or Stainless Steel Filled PTFE.
8. Ambient Operating Temperature Limits: -10 to 150□F (-12.2 to 66 □C).

C. Butterfly Type:

1. Body: Extended neck epoxy coated cast or ductile iron with full lug pattern, ANSI Class bolt pattern to match specified flanges.
2. Seat: EPDM replaceable, non-collapsible, phenolic backed
3. Disc: Polished aluminum bronze or stainless steel, pinned or mechanically locked to shaft. Sanded castings are not acceptable.
4. Bearings: Bronze or stainless steel
5. Shaft: 416 stainless steel supported at three locations with PTFE bushings for positive shaft alignment.
6. Close Off: Bubble-tight shutoff at rated differential pressure.
7. Operation: Valve and actuator operation shall be smooth both seating and unseating. Should more that 2 psi deadband be required to seat/unseat the valve, valve shall be replaced at no additional cost to the Using Agency.
8. Manufacturers in Addition to Section 2.04 A:

    a. Jamesbury
    b. Keystone
    c. Dezurik
    d. Or equal

D. Characterized Ball Type

1. Valves shall be specifically designed for modulating duty in control application with guaranteed average leak-free life span over 200,000 full stroke cycles.
2. Maximum size: 3 inch
3. Industrial quality with nickel plated forged brass bronze bodies and female NPT threads.
4. Blowout proof stem design, glass-reinforced Teflon thrust seal washer and stuffing box ring with minimum 600 PSI rating (two way valves) or 400 PSI rating (three way valves). The stem packing shall consist of 2 lubricated O-rings designed for on-off, floating, or modulating service and requiring no maintenance.
5. Valves suitable for water or low-pressure steam shall incorporate an anti-condensation cap thermal break in stem design.
6. Ball: stainless steel
7. Stem: stainless steel
8. Port: Segmented design with characterizing disk held securely by a keyed ring.

E. Valve assembly pressure ratings:

1. Chilled water: 125 psi at 60□F.

2. Hot water: 125 psi at 200□F.
3. Condenser water. 125 psi at 60□F.

F. Valve Selection

1. Valve type:

a. Modulating 2-way or 3-way valves: globe or characterized ball type. Butterfly valves may also be used for applications requiring low valve authority (pressure drop 1 psi and less) such as cooling tower bypass and boiler bypass. Valves (in conjunction with actuator) shall have minimum rangeability of 100 to 1.

1) 3 inch and less: characterized ball type
2) 4 inch and greater: globe type

b. Two-position: butterfly or ball valves

2. Valve Characteristic:

a. 2-way valves: equal percentage or modified equal percentage.
b. 3-way valves controlling cooling coils and condenser water heat exchangers: linear.
c. 3-way valves controlling heating coils: equal percentage or modified equal percentage.
d. Two-position valves: not applicable.

3. Valve Sizing

a. Modulating Water: Size valve to achieve the following full-open pressure drop:

(1) Minimum pressure drop: equal to pressure drop of coil or exchanger.
(2) Maximum pressure drop:

a) Hot and chilled water at bridge connection: 2 psi.
b) Hot water at coils: 2 psi.
c) Chilled water at coils: 5 psi.
d) Tower bypass: 1 psi.
e) Boiler bypass: 1 psi

(3) Three-way valves shall be selected for near minimum pressure drop. Two-way valves shall be selected near maximum pressure drop.
(4) Flow coefficient (C_v) shall not be less than 1.0 (to avoid clogging).

b. Modulating Steam:

(1) The outlet pressure of valves for converters shall be no less than the inlet pressure required for the converters as given in plans for project.
(2) As limited above, size modulating valves for applications of 15 psig or less for 80% of inlet gage pressure unless otherwise indicated.
(3) As limited above, modulating valves for applications of greater than 15 psig shall be sized for 42% of inlet absolute pressure unless otherwise indicated.

c. Two-position valves: Line size unless otherwise indicated.

2.5 CONTROL DAMPERS

A. See Section 23 33 00 – Duct Accessories

2.6 ACTUATORS

A. Manufacturers:

1. Belimo
2. Siemens
3. Johnson Controls
4. Delta
5. Invensys
6. Or equal

B. Warranty: Valve and damper actuators shall carry a manufacturer's 5-year warranty.

C. Electric Actuators

1. Entire actuator shall be UL or CSA approved by a National Recognized Testing Laboratory.
2. Dampers. The actuator shall be direct coupled over the shaft, enabling it to be mounted directly to the damper shaft without the need for connecting linkage. The clamp shall be steel of a "V" bolt design with associated "V" shaped, toothed cradle attaching to the shaft for maximum strength and eliminating slippage via cold weld attachment. Single bolt or set screw type fasteners are not acceptable. Aluminum clamps are unacceptable.
3. Valves. Actuators shall be specifically designed for integral mounting to valves without external couplings.
4. Actuator shall have microprocessor based motor controller providing electronic cut off at full open so that no noise can be generated while holding open. Holding noise level shall be inaudible.
5. Actuators shall provide protection against actuator burnout using an internal current limiting circuit or digital motor rotation sensing circuit. Circuit shall insure that actuators cannot burn out due to stalled damper or mechanical and electrical paralleling. End switches to deactivate the actuator at the end of rotation or use of magnetic clutches are not acceptable.
6. Modulating actuators:

    a. General: Actuators shall accept a 0 to 10 VDC or 0 to 20 mA control signal and provide a 2 to 10 VDC or 4 to 20 mA operating range. Actuators shall have positive positioning circuit so that controlled device is at same position for a given signal regardless of operating differential pressure.
    b. Optional for VAV box dampers only: Actuators may be floating type if either:

        1) Feedback from the actuator is provided as an analog input; or
        2) For VAV boxes not serving areas occupied 24 hours per day, damper position is estimated by timing pulse-open and pulse-closed commands with auto-zeroing whenever zone is in Unoccupied mode and damper is driven full closed.

7. Where shown on Drawings or Points List, actuators shall include

    a. 2 to 10 VDC position feedback signal.
    b. Limit (end) position switches

8. All 24 VAC/DC actuators shall operate on Class 2 wiring and shall not require more than 10 VA for AC. Actuators operating on 120 VAC power shall not require more than 10 VA. Actuators operating on 230 VAC power shall not require more than 11 VA.
9. All modulating actuators shall have an external, built-in switch to allow the reversing of

direction of rotation.

10. Actuators shall be provided with a conduit fitting an a minimum three-foot electrical cable and shall be pre-wired to eliminate the necessity of opening the actuator housing to make electrical connections.
11. Where fail-open or fail-closed position is required, an internal mechanical, spring return mechanism shall be built into the actuator housing. Non-mechanical forms of fail-safe are not acceptable. All spring return actuators shall be capable of both clockwise or counterclockwise spring return operation by simply changing the mounting orientation.
12. Actuators shall be capable of being mechanically and electrically paralleled to increase torque where required.
13. All non-spring return actuators shall have an external manual gear release to allow manual positioning of the damper when the actuator is not powered. Spring return actuators with more than 60 in-lb torque capacity shall have a manual crank for this purpose.
14. Actuators shall be designed for a minimum of 60,000 full cycles at full torque and be UL 873 listed.
15. Provide limit (end) position switches where indicated on schematics.

D. Electric Actuators for Large Butterfly Valves

1. Entire actuator shall be UL or CSA approved by a National Recognized Testing Laboratory.
2. The valve actuator shall consist of a capacitor-type reversible electric motor, gear train, limit switches and terminal block, all contained in a die cast aluminum enclosure.
3. Enclosure shall meet NEMA 4 weatherproof requirements for outdoor applications. Unless NEMA-3R indicated elsewhere.
4. Output shaft shall be electroless nickel plated to prevent corrosion.
5. Actuator shall have a motor rated for minimum 75% duty cycle. Duty cycle shall be defined as running time / Installed time at maximum torque
6. Actuator shall be suitable for operation in ambient temperature ranging from -22□F to +150□F (-30□C to +65□C).
7. A pre-wired cable shall bring wiring outside enclosure to avoid necessity of opening cover.
8. Gears shall be hardened alloy steel, permanently lubricated. A self-locking gear assembly or a brake shall be supplied.
9. Actuator shall be equipped with a hand wheel for manual override to permit operation of the valve in the event of electrical power failure or system malfunction. Hand wheel must be permanently attached to the actuator. When in manual operation electrical power to the actuator will be permanently interrupted.
10. The hand wheel will not rotate while the actuator is electrically driven.
11. Actuator shall have heater and thermostat to minimize condensation within the actuator housing.
12. Provide limit (end) position switches where indicated on schematics.

E. Normal Position. Actuators shall be spring return to the normal position, unless non-spring style is specifically listed as acceptable in table below. Except as specified otherwise, “normal” positions of control devices shall be as follows:

Device	**Normal Position**	**Spring Return Required**
AHU heating coil valves:	OPEN	
AHU cooling coil valves:	OPEN	
Equipment isolation valves:	OPEN	
Outside air damper:	CLOSED	Yes
Return air damper:	OPEN	Yes
Exhaust/relief air damper:	CLOSED	Yes
Domestic hot water generator valves	CLOSED	

Hot water reheat coil valves:	OPEN	
Fan-coil HW and CHW valves:	OPEN	
VAV box dampers:	OPEN	

F. Valve Actuator Selection:

1. Modulating actuators for valves shall have minimum rangeability of 50 to 1.
2. Water:

a. Two way and two-position valves:

(1) Tight closing against 125 percent of system pump shut-off head.
(2) Modulating duty against 90 percent of system pump shut-off head.

b. Three-way shall have close-off against twice the full open differential pressure for which they are sized.

G. Damper Actuator Selection:

1. Actuators shall be direct coupled. For multiple sections, provide one actuator for each section; linking or jack-shafting damper sections shall not be allowed.
2. Provide sufficient torque as velocity, static, or side seals require per damper manufacturer's recommendations and the following.

a. Torque shall be a minimum 5 in-lb. per sq. ft. for opposed blade dampers and 7 in-lb. per sq. ft. for parallel blade dampers.
b. The total damper area operated by an actuator shall not exceed 80% of the manufacturer's maximum area rating.

2.7 GENERAL FIELD DEVICES

A. Provide field devices for input and output of digital (binary) and analog signals into controllers (BCs, AACs, ASCs). Provide signal conditioning for all field devices as recommended by field device manufacturers, and as required for proper operation in the system.

B. It shall be the Contractor's responsibility to assure that all field devices are compatible with controller hardware and software.

C. Field devices specified herein are generally ‘two-wire’ type transmitters, with power for the device to be supplied from the respective controller. If the controller provided is not equipped to provide this power, or is not designed to work with ‘two-wire’ type transmitters, or if field device is to serve as input to more than one controller, or where the length of wire to the controller will unacceptably affect the accuracy, the Contractor shall provide ‘four-wire’ type equal transmitter and necessary regulated DC power supply or 120 VAC power supply, as required.

D. For field devices specified hereinafter that require signal conditioners, signal boosters, signal repeaters, or other devices for proper interface to controllers, Contractor shall furnish and install proper device, including 120V power as required. Such devices shall have accuracy equal to, or better than, the accuracy listed for respective field devices.

E. Accuracy: As used in this Section, accuracy shall include combined effects of nonlinearity, nonrepeatability and hysteresis. Sensor accuracy shall be at or better than both that specifically listed for a device and as required by paragraph 1.3A.

2.8 TEMPERATURE SENSORS (TS)

A. General:

1. Unless otherwise noted, sensors may be platinum RTD, thermistor, or other device that is commonly used for temperature sensing and that meets accuracy, stability, and resolution requirements.
2. When matched with A/D converter of BC, AAC, or ASC, sensor range shall provide a resolution of no worse than 0.3°F (0.16˚C) (unless noted otherwise).
3. Sensors shall drift no more than 0.3˚F and shall not require calibration over a five-year period.
4. Manufacturers:

    a. Mamac
    b. Kele Associates
    c. Building Automation Products Inc.
    d. Or equal

B. Duct temperature sensors. Shall consist of sensing element, junction box for wiring connections and gasket to prevent air leakage or vibration noise. Sensor probe shall be 316 stainless steel.

1. TS-1A. Single point (use where not specifically called out to be averaging in points list).
2. TS-1B. Averaging. Sensor length shall be at least 1 linear foot for each 3 square feet of face area up to 25 feet maximum.

C. Water temperature sensors.

1. TS-2A: Immersion sensors. All piping immersion sensors shall be in brass or stainless steel wells that allow removal from operating system, with lagging extension equal to insulation thickness where installed in insulated piping. Wells shall be rated for maximum system operating pressure, temperature and fluid velocity. The well shall penetrate the pipe by the lesser of half the pipe diameter or four inches. The use of direct immersion or strap-on type sensors is not acceptable.
2. TS-2B. Same as TS-2A except provide matched temperature sensors for differential temperature measurement, e.g. chilled water supply and return temperature. See paragraph 1.3A.
3. TS-2C. Same as TS-2A or TS-2B (matched pair) with the following added requirements (for extremely high accuracy and stability at central plant main supply/return chilled water temperature sensors): Each assembly shall consist of a 100 Ohm platinum RTD and a solid-state 4-wire, 4-20mA transmitter contained in a housing suitable for pipe mounting, spring-loaded probe to ensure good thermal contact between the sensor and the well. Manufacturer must be certified as meeting the requirements of ISO 9001. RTD shall conform to the DIN 437601980 standards (Ultra precision DIN RTD). 2 Year NIST traceable guarantee. Manufacturer: Accutech AI-2000, or equal.

D. Room sensors: Shall be an element contained within a ventilated cover, suitable for wall mounting, with insulated base.

1. TS-3A.

    a. Thermistor in enclosure with blank cover.
    b. Include a USB port for connection of portable Operator Interface.

2. TS-3B. Same as TS-3A except

a. Setpoints shall be adjustable at wall mounted sensor with setpoint knobs with software limits.
b. Override button capable of being programmed to start system during unscheduled hours.

3. TS-3C. Same as TS-3B except:

a. Integral LCD display of space temperature and active setpoint.

4. Unless otherwise indicated in points list, locate sensors as follows:

a. Lobbies, corridors, break rooms, library reading rooms, and other public spaces: TS-3A.
b. Equipment rooms: TS-3A
c. Offices and other spaces not listed above: TS-3C.

E. TS-4. Outdoor air sensors shall have a sun shield, utility box, and watertight gasket to prevent water seepage.

F. TS-5. Dewpoint.

1. Industrial humidity sensor designed for applications with a risk of condensation.
2. Stainless steel probe head leak-proof up to 1 MPa.
3. Configurable to output dewpoint, relative humidity, and temperature.
4. TS-5A: Include local LCD readout.
5. Manufacturer

a. Vaisala HMP-247
b. No known equal

G. Temperature Transmitters. Where required by Controller, or to meet specified end-to-end accuracy requirements, sensors as specified above shall be matched with transmitters outputting 4-20 mA linearly across the specified temperature range. Transmitters shall have zero and span adjustments, an accuracy of 0.1˚F when applied to the sensor range.

2.9 DIFFERENTIAL PRESSURE TRANSMITTERS (DP)

A. DPT-1. Water, General Purpose

1. Fast-response capacitance sensor
2. Two-wire transmitter, 4-20 mA output with zero and span adjustments.
3. Accuracy

a. Overall Accuracy (at constant temp) ±0.25% full scale (FS).
b. Non-Linearity, BFSL ±0.20% FS.
c. Hysteresis 0.10% FS.
d. Non-Repeatability 0.05% FS.

4. Long Term Stability 0.5% FS per year
5. Only 316 stainless steel in contact with fluid
6. Pressure limits

a. 0 to 100 psid range: 250 psig maximum static pressure rating, 250 psig maximum

overpressure rating.
b. 100 to 300 psid range: 450 psig maximum static pressure rating, 450 psig maximum overpressure rating.

7. Include brass 3-valve assembly. See sensor installation specifications below.
8. Manufacturers

a. Setra 230
b. Modus W30
c. Or equal

B. DPT-2. Liquid

1. General: Two-wire smart DP cell type transmitter, 4-20 mA or 1-5 Vdc user-selectable linear or square root output, adjustable span and zero, stainless steel wetted parts.
2. Ambient limits: –40 to 175□F, 0 to 100% RH.
3. Process fluid limits:

a. Other applications: 0°F to 250□F

4. Accuracy: less than 0.15% of span, combined errors of reference accuracy, ambient temperature effect, and line pressure effect.
5. Rangeability: greater than 50::1.
6. Long term stability: ±0.15% of upper range limit for 5 years; for ±50°F temperature changes, 0-100% relative humidity.
7. Vibration Effect: Less than □0.1% of upper range limit from 15 to 2000 Hz in any axis relative to pipe mounted process conditions.
8. The transmitter shall be capable of sustaining differential pressures in either direction, up to the body rating without damage to the instrument or a loss of accuracy.
9. Output Damping: Time constant user selectable from 0 to 36 seconds.
10. Transmitter shall have dual-compartment housing with a moisture barrier totally isolating the electronic circuitry from the field wiring and calibration terminals. Provide local LCD display and wire-on-tag with instrument service information.
11. Manufacturer must be certified as meeting the requirements of ISO 9001.
12. Manufacturers:

a. Rosemount Inc. 3051 Series
b. Accutech
c. Foxboro,
d. Johnson-Yokagawa
e. Mamac
f. Or equal

C. DPT-3. Air, Duct Pressure:

1. General: Loop powered two-wire differential capacitance cell-type transmitter.
2. Output: two wire 4-20 mA output with zero adjustment.
3. Overall Accuracy: ±1% scale.
4. Minimum Range: 0.5 in. w.c.
5. Maximum Range: 10 inches w.c.
6. Housing: Polymer housing suitable for surface mounting.
7. Static Sensing Element: Pitot-type static pressure sensing tips similar to Dwyer model A-301, Davis Instruments, or equal and connecting tubing.
8. Range: Select as specified in points list or, if not listed for specified setpoint to be between 25% and 75% full-scale.

9. DPT-3A: Include LCD display of reading.
10. Manufacturers:

    a. Veris
    b. Setra
    c. Modus
    d. Invensys
    e. Dwyer
    f. Or equal

D. DPT-4. Air, Low Differential Pressure (space pressure)

1. General: Loop powered, two-wire differential capacitance cell type transmitter.
2. Output: Two-wire 4-20 mA output with zero adjustment.
3. Overall Accuracy: Plus or minus 1%.
4. Minimum Range: 0, -0.1, -0.25, or -0.5 inches w.c
5. Maximum Range: +0.1, 0.25, or 0.5 inches w.c.
6. Housing: Polymer housing suitable for surface mounting.
7. Static Sensing Element:

    a. Ambient sensor: Dwyer A-306
    b. Space sensor: Open tube or Bosco plate sensor

8. Range: Select as specified in points list or, if not listed for specified setpoint to be between 25% and 75% full-scale.
9. DPT-4A: Include LCD display of reading.
10. Manufacturers:

    a. Veris
    b. Setra
    c. Modus
    d. Invensys
    e. Dwyer
    f. Or equal

E. DPT-5. VAV Velocity Pressure:

1. General: Loop powered two-wire differential capacitance cell type transmitter.
2. Output: Two-wire, 4-20 mA output with zero adjustment.
3. Flow transducer (including impact of A-to-D conversion) shall be capable of stably controlling to a setpoint of 0.004” differential pressure or lower, shall be capable of sensing 0.002” differential pressure or lower, and shall have a ±0.001” or lower resolution across the entire scale. .
4. Minimum Range: 0 in. w.c.
5. Maximum Range: 1.5 inch w.c.
6. Housing: Polymer housing suitable for surface mounting.
7. Manufacturer:

    a. Trane
    b. Johnson Controls
    c. Siemens
    d. Automated Logic
    e. Honeywell
    f. Veris
    g. Or equal

F. Water Leak Detector (WLD):

1. Gold plated adjustable sensing probes to detect water from 0 to 1/8 inch above surface.
2. All electronic circuitry encapsulated in epoxy to protect from dirt, fungus and short term immersion in water.
3. DPDT (2 form C) relay contact outputs rated at 1 amp @ 28 VDC
4. Powered with 12-24 VAC or VDC from EMCS panel. Battery not acceptable
5. 5 year warranty minimum
6. Manufacturer:

a. Dorlen Water Alert SS-4
b. Or equal

2.10 HUMIDITY TRANSMITERS (HT)

A. Suitable for duct, wall (room) or outdoor mounting as indicated in points list and Construction Drawings
B. Two-wire transmitter utilizing bulk polymer resistance change or thin film capacitance change humidity sensor producing a continuous 4-20 mA output proportional to percent relative humidity (%RH).
C. Input Range: 0 to 100% RH
D. Accuracy (%RH), NIST Traceable and certified at 77 ˚F over 20-95% RH including hysteresis, linearity and repeatability:

1. HT-1: ±2%
2. HT-2: ±3%

E. Sensor Operating Range

1. Humidity: 0-99%, non-condensing, sensor
2. Temperature: 32 ˚F to 122 ˚F

F. Temperature Effect: Less than 0.06% per ˚F at baseline of 77 ˚F.
G. Sensitivity: 0.1% RH.
H. Repeatability: 0.5 RH.
I. Hysteresis: Less than 1%.
J. Long Term Stability: Less than 2% drift per 5 years.
K. Manufacturer

c. Vaisala HM Series
d. Automation Components Inc. RH Series
e. Or equal

2.11 DIFFERENTIAL PRESSURE SWITCHES (DPS)

A. DPS-1. Water: Diaphragm with adjustable setpoint, 2 psig or adjustable differential, and snap-acting Form C contacts rated for the application. 60 psid minimum pressure differential range. 0□F to 160□F operating temperature range.

B. DPS-2. Air: Diaphragm with adjustable setpoint and differential and snap acting form C contacts rated for the application. Provide manufacturer's recommended static pressure sensing tips and connecting tubing

2.12 CURRENT SWITCHES (CS)

A. CS-1 (Constant Speed Motor Status Indication)

1. Clamp-on or solid-core
2. Range: 1.5 to 150 amps.
3. Trip Point: Adjustable.
4. Switch: Solid state, normally open, 1 to 135 Vac or Vdc, 0.3 Amps. Zero off state leakage.
5. Lower Frequency Limit: 6 Hz.
6. Trip Indication: LED
7. Approvals: UL, CSA
8. May be combined with relay for start/stop.
9. Where used for single-phase devices, provide the CS/CR in a self-contained unit in a housing with override switch. Kele RIBX, Veris H500, or equal.
10. Manufacturers:

    a. Veris Industries H-708/908; Inc.
    b. RE Technologies SCS1150A-LED
    c. Or equal.

B. CS-2 (Variable Speed Motor Status Indication)

1. Clamp-on or solid-core
2. Range: 1.5 to 135 Amps.
3. Trip Point: Self-calibrating based on VA memory associated with frequency to detect loss of belt with subsequent increase of control output to 60 Hz. The belt break scenario shall be indicated as a loss of status and the operation at low speed shall indicate normal status.
4. Switch: Solid state, normally open, 1 to 135 Vac or Vdc, 0.3 Amps. Zero off state leakage.
5. Frequency Range: 5-75 Hz
6. Trip Indication: LED
7. Approvals: UL, CSA
8. Manufacturers:

    a. Veris Industries, Inc. H-904.
    b. RE Technologies
    c. Or equal.

2.13 CURRENT TRANSFORMERS (CT)

A. Clamp-On Design Current Transformer (for Motor Current Sensing)

1. Range: 1-10 amps minimum, 20-200 amps maximum
2. Trip Point: Adjustable
3. Output: 0-5 VDC.
4. Accuracy: □0.2% from 20 to 100 Hz.
5. Manufacturers: KELE SC100, Veris 722, or equal.

2.14 FLOW METER (FM)

A. FM-1. Magnetic Flow Tube Flow Meters for Water Service

1. General Requirements:

   a. Sensor shall be a magnetic flow meter, which utilizes Faraday's Law to measure volumetric fluid flow through a pipe. The flow meter shall consist of 2 elements, the sensor and the electronics. The sensor shall generate a measuring signal proportional to the flow velocity in the pipe. The electronics shall convert this EMF into a standard current output.
   b. Electronic replacement shall not affect meter accuracy (electronic units are not matched with specific sensors).
   c. Provide a four-wire, externally powered, magnetic type flow transmitter with adjustable span and zero, integrally mounted to flow tube.

      (1) Output: 4-20 mA proportional to the flow rate or velocity

   d. Flow Tube:, ANSI class 150 psig Stainless steel protected with ETFE or PFAT liner
   e. ANSI flanges
   f. Electrical Enclosure: NEMA 4, 7.
   g. Approvals: UL or CSA.
   h. The electrode material shall be 316L Stainless steel.
   i. Approvals

      (1) UL or CSA
      (2) NFF Drinking Water approval for domestic water applications

   j. Performance:

      (1) Accuracy shall be ±0.5% of actual reading from 3 to 30 feet per second flow velocities, and 0.015 fps from 0.04 fps to 3 fps.
      (2) Stability: 0.1% of rate over six months.
      (3) Meter repeatability shall be +/- 0.1% of rate at velocities > 3 ft/sec.
      (4) Calibration: The sensor must be calibrated on an internationally accredited (i.e. NAMAS) flow rig with accuracy better than 0.1%. Calibration shall be NIST traceable.

2. Manufacturers:

   a. Siemens/Danfoss Magflo 3100
   b. Krohne Optiflux 4000
   c. Sparling Tigermag EP FM656
   d. Onicon 3000 series

B. FM-2. Magnetic Insertion Type Flow Meters for Water Service

1. Magnetic Faraday point velocity measuring device.
2. Insertion type complete with 'hot-tap' isolation valves to enable sensor removal without water supply system shutdown.
3. 4-20 mA transmitter proportional to flow or velocity.
4. Accuracy: ± 1% of reading from 0.25 to 20 fps.
5. Flow range: 0.25 to 20 fps, bidirectional.
6. Each sensor shall be individually calibrated and tagged accordingly against the manufacturer's primary standards which must be accurate to within 0.1% and traceable to the U.S. National Institute Standards and Technology (NIST).
7. Manufacturers:

   a. Onicon F-3500

b. FloCat YD20-A
c. Marsh McBirney MultiMag 284
d. SeaMetrics 100/200 Series

C. FM-3: Displacement Gas Meter

1. Positive displacement, rotary type gas meter designed for volumetric measurement of widely varying flow rates of low pressure natural gas
2. Permanent, non-adjustable calibration, not affected by low or varying line pressure and independent of the gas specific gravity, temperature, and pressure
3. Manufactured in accordance with ANSI B109.3 for Rotary Type Gas Displacement Meters
4. Operating temperature range: -40 ˚F to +140 ˚F
5. Temperature compensating with a corrected reading for temperatures ranging from -20 ˚F to +120 ˚F
6. Low frequency pulse output
7. Rangeability at ±1% accuracy: Minimum 40 to 1
8. Glass enclosed 8 digit totalizer, re-zeroed with on-board device
9. Manufacturer

a. Dresser Roots B3
b. Or equal

D. FM-4. Vortex shedding flow meter for liquid, steam and gas service:

1. Output: 4-20 mA, 0-10 Vdc, 0-5 Vdc
2. Maximum Fluid Temperature: 800 □F (427 □C)
3. Wetted Parts: Stainless Steel
4. Housing: NEMA 4X
5. Turndown: 10:1 minimum.
6. Accuracy: 0.5% of calibrated span for liquids, 1% of calibrated span for steam and gases.
7. Each sensor shall be individually calibrated and tagged accordingly against the manufacturer's primary standards which must be accurate to within 0.1% and traceable to the U.S. National Institute Standards and Technology (NIST).
8. Body: Wafer style or ANSI flanged to match piping specification.
9. Manufacturers:

a. Foxboro 83 series
b. Johnson-Yokagawa
c. Rosemount
d. Or Equal

E. FM-5. Ultrasonic Flow Meter for Water Service.

1. Clamp-On transit-time ultrasonic flow meter
2. Wide-Beam transducer technology
3. 4-20 mA transmitter proportional to flow or velocity.
4. Accuracy: 0.5% of reading in range 1 to 30 fps, 0.001 fps sensitivity.
5. Each sensor shall be individually calibrated and tagged accordingly against the manufacturer's primary standards which must be accurate to within 0.1% and traceable to the U.S. National Institute Standards and Technology (NIST).
6. Controlotron 1020C or equal.

F. FM-6. Insertion type dual turbine meter for water service.

1. Dual counter-rotating axial turbine elements, each with its own rotational sensing system, and

an averaging circuit to reduce measurement errors due to swirl and flow profile distortion. Flow sensing turbine rotors shall be non-metallic and not impaired by magnetic drag.

2. Insertion type complete with 'hot-tap' isolation valves to enable sensor removal without water supply system shutdown.
3. Sensing method shall be impedance sensing (iron magnetic and non-photoelectric), with volumetric accuracy of +/- 2% of reading over middle 80% of operating range, and +/- 4% of
4. Each sensor shall be individually calibrated and tagged accordingly against the manufacturer's primary standards which must be accurate to within 0.1% and traceable to the U.S. National Institute Standards and Technology (NIST).
5. Maximum operating pressure of 400 psi and maximum operating temperature of 200□F continuous (220□F peak).
6. All wetted metal parts shall be constructed of 316 stainless steel.
7. Analog outputs shall consist of non-interactive zero and span adjustments, a DC linearly of 0.1% of span, voltage output of 0-10 V, and current output of 4-20 mA.
8. Manufacturers:

    a. Onicon Corp.
    b. Hersey
    c. Or equal

G. FM-7. Compound-type cold water meter.

1. Shall consist of a combination of a turbine-type, mainline meter for measuring high rates of flow and a bypass meter of an appropriate size for measuring low rates of flow. The compound meter shall have an automatic valve mechanism for diverting low rates of flow through the bypass meter.
2. Comply or exceed the latest revision of AWWA C702
3. Maximum operating pressure of 150 psi and maximum operating temperature of 120 ˚F continuous.
4. Shall provide a pulse output scaled to a selectable unit of measurement; i.e., 1 pulse per gallon. The pulse output needs to retain the lowest flow rate and the accuracy that the meter is capable of.
5. Shall have permanently sealed, straight reading local register indicating in gallons, including a center-sweep test hand, a low flow indicator, totalizer, and a glass lens. The registers shall be serviceable without interruption of the meter's operation.
6. Separate magnetic-drive registers shall record the flow of the turbine and disc meters and their total will be the registration of the compound meter. A single pulse output denoting the total high and low flow will be required.

Size	Normal Operating Range @100% +/- 1.5% accuracy (gpm)	Maximum Continuous Flow (gpm)	Maximum Loss of Head at Max Cont Flow (psi)	Maximum Intermittent Flow (gpm)	Lowest Flow @ 95% accuracy (gpm)	Minimum Accuracy at Crossover (%)
2"	1/2 - 200	160	8	200	1/4	97
3"	1/2 - 450	350	8	450	1/4	97
4"	1 - 1000	700	11	1000	3/8	97
6"	1 1/2 - 2000	1400	10	2000	3/8	95

7. Operating characteristics: Shall comply with the operating characteristics shown below:
8. Size: the size shall be determined by: a) Laying Length: nominal size (in inches) of the opening in the inlet and outlet flanges and b) Total Height: nominal size (in inches) from the lowest point of the meter installed for horizontal flow to the highest point. The size of meters shall not exceed:

Meter Size	Laying Length (in)	Total Height (in)
2”	15 1/4	11
3”	17	12
4”	20	16
6”	24	17

9. Materials: The main case wetted parts shall be cast from an ANSI/NSF 61 certified no lead high copper alloy. A test plug shall be located in the main case or the cover for the purpose of field testing of the meter. Casing bolts shall be made of stainless steel.
10. Manufacturers:

    a. Badger Recordall Compound Meter, Bronze Housing with Pulse Output (two RTR registers and summator/converter)
    b. Or equal

2.15 LEVEL SWITCH

A. Conductive Level Switch

B. Integral tank mounted conductivity level switch with required SPDT 10 amp relays for thermal energy storage tank level alarms.

C. Level alarms to include low, high and overflow level.

1. Switch shall be mounted in a NEMA 4x polypropylene enclosure with 3/4 inch npt mounting
2. Manufacturer:

    a. Levelite
    b. Or equal

2.16 AIRFLOW MEASURING STATIONS (AFMS)

A. AFMS-1. Airflow measurement probes at fan inlet:

1. Transverse probes factory mounted in each inlet bell.
2. The fan inlet airflow traverse probes shall contain multiple total and static pressure sensors placed at concentric area centers along the exterior surface of the cylindrical probes and internally connected to their respective averaging manifolds. Sensors shall not protrude beyond the surface of the probe, nor be adversely affected by particle contamination normally present in building system airflows. The fan inlet airflow traverse probes shall have symmetrical averaging signal takeoffs, and shall be of aluminum construction with hard anodized finish with galvanized steel mounting hardware.
3. The fan inlet airflow traverse probes shall not significantly impact fan performance or contribute to fan generated noise levels. The probes shall be capable of producing steady, non-pulsating signals of standard total and static pressure, without need for flow corrections or factors, with an accuracy of 3% of actual flow over a fan operating range of 6 to 1 capacity turndown.
4. Provide with DPT selected as close as possible to design maximum velocity pressure to provide high accuracy at low airflow rates. See equipment schedules for design airflow rate.

5. Manufacturers

    a. Air Monitor VOLU-probe/FI
    b. Paragon FE-1050
    c. Or Equal

B. AFMS-2. Airflow measurement in duct or plenum.

1. The AFMS shall be an array of sensors mounted across the entire area of the duct in which the AFMS is mounted.
2. Include electronic devices or transducers to provide a 4-20 mA or 0-10 Vdc signal proportional to airflow or velocity with specified accuracy over entire range.
3. Performance:

    a. Sensors shall be calibrated to NIST-traceable standards for airflow/velocity.
    b. Factory tested prior to shipment and shall not require calibration or adjustment over the life of the equipment, when installed in accordance to manufacturer's guidelines.
    c. The installed total accuracy for airflow shall be better than ±3% of reading over the sensor probe operating ranges when installed in accordance with manufacturers' guidelines. Installed accuracy shall include the probe itself plus the electronics for converting probe signal to an electronic signal proportional to airflow and shall be demonstrated at both maximum and minimum airflow rates of operating range.
    d. Operating Range: 50 to 4,000 FPM

4. Duct & Plenum Mounted Sensor Probes

    a. Sensor probes shall be constructed of anodized aluminum alloy tube with stainless steel mounting brackets. Probes shall be constructed to provide insertion, internal, or standoff mounting, depending on the applications and field installation requirements.
    b. Probe Sensor Density. The number of independent sensing points shall be distributed per duct face area, at a minimum quantity as indicated below.

Area (ft^2)	Sensors
<= 1	2
>1 to <4	4
4 to <8	6
8 to <12	8
12 to <16	12
>=16	16

    c. Pressure drop: The maximum allowable unrecovered pressure drop caused by the probes shall not exceed .025" at 2000 FPM, or .085" at 4000 FPM.

5. Manufacturers:

    a. Ebtron Gold Series
    b. Ruskin
    c. Or Equal

2.17 CO_2 SENSORS/TRANSMITTERS (CO2)

A. CO2-1. Wall mounted.

1. Non-dispersive infrared sensor with dual beam technology where a reference channel is used to maintain sensor calibration.
2. Detachable base with all field wiring terminations on base.
3. Accuracy: ±50 ppm or 5% of reading from 0 to 1500 ppm at temperatures from 60°F to 90°F.
4. Factory calibrated and set to 0-2000 ppm range (equals 4-20 mA or 0-10 V)
5. Include elevation adjustment.
6. The sensor shall not require recalibration for a minimum of 5 years, guaranteed. If sensor is found to be out of calibration, supplier shall recalibrate at no additional cost to the Using Agency within 5 years of purchase date.
7. No display.
8. Manufacturers:

    a. Telaire 8101 or 8102 with cover over display.
    b. Veris
    c. Or Equal

B. CO2-2. Duct mounted.

1. CO_2 sensors shall use silicon based, diffusion aspirated, infrared single beam, dual-wavelength sensor.
2. Accuracy: ±36 ppm at 800 ppm and 68□F.
3. Stability: 5% over 5 years.
4. Output: 4-20 mA, 0-10 Vdc or relay.
5. Duct mounted.
6. Manufacturers

    a. Vaisala, Inc. GMD20
    b. AirTest
    c. Or equal

2.18 POWER TRANSDUCER (KWT)

A. Power measurement device shall include current and potential (voltage) transformers on each leg and shall be certified under UL-3111.

B. The transducer range shall be selected such that the maximum value shall be 150% of the nominal value being monitored.

C. Output shall be true rms power measurement with a frequency response of on no less than 2kHz (32 samples-per-cycle) on all voltage and current signals.

2.19 WEATHER SENSORS

A. Temperature

1. See TS-4 for sensor specifications.
2. Enclose in fan-aspirated radiation shield that combines both active and passive aspiration to minimize the effects of radiation.

    a. Motor-driven fan draws air through the sensor chamber and exhausts it through the top of the shield.
    b. Triple-walled sensor chamber shielded by flow-through plates.
    c. Aspiration rate: minimum is 220 feet per minute.

d. Davis Instruments 7752 or equal.

2.20 ELECTRIC CONTROL COMPONENTS

A. Limit Switches (LS): Limit switches shall be UL listed, SPDT or DPDT type, with adjustable trim arm. Limit switches shall be as manufactured by Square D, Allen Bradley, or equal.

B. Line-Voltage Wall Thermostat: Wall-mounted thermostat shall consist of SPDT contacts rated for 120V and current as required for application, temperature setpoint range of 50 to 95□ F, and an adjustable 2-10□F setpoint differential.

C. Low Temperature Detector (Freeze-stat) (LLT): Low temperature detector shall consist of a cold spot element that responds only to the lowest temperature along any one foot of entire element, minimum bulb size of 1/8 inch x 20 feet, junction box for wiring connections and gasket to prevent air leakage or vibration noise, DPST (4 wire 2 circuit) with manual reset, Temperature range 15 to 55˚F, factory set at 38˚F.

D. Control Relays: All control relays shall be UL listed, with contacts rated for the application, and mounted in minimum NEMA-1 enclosure for indoor locations, NEMA-4 for outdoor locations.

1. Control relays for use on electrical systems of 120 volts or less shall have, as a minimum, the following:

    a. AC coil pull-in voltage range of +10%, -15% or nominal voltage.
    b. Coil sealed volt-amperes (VA) not greater than four (4) VA.
    c. Silver cadmium Form C (SPDT) contacts in a dustproof enclosure, with 8 or 11 pin type plug.
    d. Pilot light indication of power-to-coil and coil retainer clips.

2. Relays used for across-the-line control (start/stop) of 120V motors, 1/4 HP, and 1/3 HP, shall be rated to break minimum 10 Amps inductive load.
3. Relays used for stop/start control shall have low voltage coils (30 VAC or less), and shall be provided with transient and surge suppression devices at the controller interface.

E. General Purpose Power Contactors: NEMA ICS 2, AC general-purpose magnetic contactor. ANSI/NEMA ICS 6, NEMA type 1enclosure. Manufacturer shall be Square 'D', Cutler-Hammer, or equal.

F. Control Transformers and Power Supplies:

1. Control transformers shall be UL Listed. Furnish Class 2 current-limiting type, or furnish over-current protection in both primary and secondary circuits for Class 2 service per NEC requirements. Mount in minimum NEMA-1 enclosure.
2. Transformer shall be proper size for application. Limit connected loads to 80% of rated capacity.
3. DC power supply output shall match output current and voltage requirements. Unit shall be full-wave rectifier type with output ripple of 5.0 mV maximum peak-to-peak. Regulation shall be 1.0% line and load combined, with 100 microsecond response time for 50% load changes. Unit shall have built-in over-voltage and over-current protection, and shall be able to withstand a 150% current overload for at least 3 seconds without trip-out or failure.
4. Unit shall operate between 0°C and 50°C [32°F and 120°F]. EM/RF shall meet FCC Class B and VDE 0871 for Class B, and MIL-STD 810C for shock and vibration.
5. Line voltage units shall be UL Recognized and CSA Approved.

G. Electric Push Button Switch: Switch shall be momentary contact, oil tight, push button, with number of N.O. and/or N.C. contacts as required. Contacts shall be snap-action type, and rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen Bradley, Kele, or equal.

H. Pilot Light: Panel-mounted pilot light shall be NEMA ICS 2 oil tight, transformer type, with screw terminals, push-to-test unit, LED type, rated for 120 VAC. Unit shall be 800T type, as manufactured by Allen-Bradley, Kele, or equal.

I. Alarm Horn: Panel-mounted audible alarm horn shall be continuous tone, 120 Vac Sonalert solid-state electronic signal, as manufactured by Mallory, Kele, or equal.

J. Electric Selector Switch (SS): Switch shall be maintained contact, NEMA ICS 2, oil-tight selector switch with contact arrangement, as required. Contacts shall be rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen-Bradley, Kele, or equal.

K. Window switch

1. Surface mount magnetic burglar alarm switch
2. Screw mount, magnet on window, switch on frame
3. Sealed to prevent dirt or dust contact
4. Color to match electrical and lighting switch plates in the room. See Division 16 and Electrical Drawings.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which control systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.2 INSTALLATION

A. General: Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details shown on drawings. Install electrical components and use electrical products complying with requirements of National Electric Code and all local codes.

3.3 ELECTRICAL INSTALLATION

A. Wiring

1. Comply with Division 26.
2. All NEC Class 1 (line voltage) wiring shall be UL Listed in approved raceway per NEC requirements and shall be installed by a licensed electrician.
3. All low-voltage wiring shall meet NEC Class 2 requirements. (Low-voltage power circuits shall be sub-fused when required to meet Class 2 current-limit.) Class 2 wiring shall be installed in UL Listed approved raceway, except where wires are in concealed in accessible locations, approved cables not in raceway may be used, provided that cables are UL Listed for the intended application. For example, cables used in ceiling return plenums shall be UL Listed specifically for that purpose.
4. Do not install Class 2 wiring in raceway containing Class 1 wiring. Boxes and panels containing high-voltage wiring and equipment may not be used for low-voltage wiring except

for the purpose of interfacing the two (e.g., relays and transformers).

5. Do not install wiring in raceway containing tubing.
6. Where Class 2 wiring is used without raceway, it shall be supported from or anchored to structural members neatly tied at 10 foot intervals. Cables shall not be supported by or anchored to ductwork, electrical raceways, piping, or ceiling suspension systems and at least 1 foot above ceiling tiles and light fixtures.
7. All wire-to-device connections shall be made at a terminal block or terminal strip. All wire-to-wire connections shall be at a terminal block.
8. All field wiring shall be properly labeled at each end, with self-laminating typed labels indicating device address, for easy reference to the identification schematic. All power wiring shall be neatly labeled to indicate service, voltage, and breaker source.
9. Use coded conductors throughout with different colored conductors.
10. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals.
11. Maximum allowable voltage for control wiring shall be 120 V. If only higher voltages are available, the Contractor shall provide step-down transformers.
12. All wiring shall be installed as continuous lengths, with no splices permitted between termination points.
13. Install plenum wiring in sleeves where it passes through walls and floors. Maintain fire rating at all penetrations.
14. Size of raceway and size and type of wire shall be the responsibility of the Contractor, in keeping with the manufacturer's recommendation and NEC requirements.
15. Include one pull string in each raceway 1 inch or larger.
16. Control and status relays are to be located in designated enclosures only. These enclosures include packaged equipment control panel enclosures unless they also contain Class 1 starters.
17. Conceal all raceways, except within mechanical, electrical, or service rooms. Install raceway to maintain a minimum clearance of 6” from high-temperature equipment (e.g., steam pipes or flues).
18. Secure raceways with raceway clamps fastened to the structure and spaced according to code requirements. Raceways and pull boxes may not be hung on flexible duct strap or tie rods. Raceways may not be run on or attached to ductwork.
19. Install insulated bushings on all raceway ends and openings to enclosures. Seal top end of all vertical raceways.
20. The EMCS Contractor shall terminate all control and/or interlock wiring, and shall maintain updated (as-built) wiring diagrams with terminations identified at the job site.
21. Flexible metal raceways and liquid-tight, flexible metal raceways shall not exceed 3 feet in length and shall be supported at each end. Flexible metal raceway less than ½” electrical trade size shall not be used. In areas exposed to moisture liquid-tight, flexible metal raceways shall be used.
22. Raceway must be rigidly installed, adequately supported, properly reamed at both ends, and left clean and free of obstructions. Raceway sections shall be joined with couplings (per code). Terminations must be made with fittings at boxes, and ends not terminating in boxes shall have bushings installed.
23. Electrical service to controls panels and control devices shall be provided by isolated circuits, with no other loads attached to the circuit, clearly marked at its source. The location of the breaker shall be clearly identified in each panel served by it. If a spare breaker is not available within an electrical panel, the EMCS Contractor shall be responsible for providing any and all equipment and labor necessary to supply an isolated circuit. Controllers controlling only packaged air conditioning equipment may be powered directly from the packaged units control circuit.
24. Wire digital outputs to either the normally-closed or normally-open contacts of binary output depending on desired action in case of system failure. Unless otherwise indicated, wire to the NO contact except the following shall be wired to the NC contact:

a. Hot water pumps
b. Coil recirc' pumps provided for freeze protection.

25. Hardwire Interlocks

a. The devices referenced in this section are hardwire interlocked to ensure equipment shutdown occurs even if control systems are down. Do not use software (alone) for these interlocks.
b. Hardwire device NC contact to air handler fan starter upstream of HOA switch, or to VFD enable contact.
c. Where multiple fans (or DDC DI) are controlled off of one device and the device does not have sufficient contacts, provide a relay at the device to provide the required number of contacts.
d. Provide for the following devices where shown on plans:

(1) Duct smoke detector
(2) High discharge static pressure
(3) Low mixing plenum pressure
(4) Freeze-stats

B. Communication Wiring

1. The EMCS Contractor shall adhere to the requirements of paragraph 3.3A in addition to this section.
2. Communication and signal wiring may be run without conduit in concealed, accessible locations as permitted by paragraph 3.3A only if noise immunity is ensured. Contractor will be fully responsible for noise immunity and rewire in conduit if electrical or RF noise affects performance.
3. All cabling shall be installed in a neat and workmanlike manner. Follow all manufacturers' installation recommendations for all communication cabling. Use shielded wiring if recommended by manufacturer.
4. Do not install communication wiring in raceway and enclosures containing Class 1 or other Class 2 wiring.
5. Maximum pulling, tension, and bend radius for cable installation as specified by the cable manufacturer shall not be exceeded during installation.
6. EMCS Contractor shall verify the integrity of the entire network following the cable installation. Use appropriate test measures for each particular cable.
7. All runs of communication wiring shall be unspliced length when that length is commercially available.
8. All communication wiring shall be labeled to indicate origination and destination data.
9. Grounding of coaxial cable shall be in accordance with NEC regulations Article on Communications Circuits, Cable and Protector Grounding.
10. Shielded cable shield shall be grounded only at one end.
11. Power-line carrier signal communication/transmission is not acceptable.

3.4 INSTALLATION OF SENSORS

A. Install sensors in accordance with the manufacturer's recommendations.

B. Mount sensors rigidly and adequately for the environment within which the sensor operates.

C. Temperature Sensors

1. Room temperature sensors/thermostats shall be installed on concealed junction boxes

properly supported by the wall framing.

2. All wires attached to sensors shall be air sealed in their raceways or in the wall to stop air transmitted from other areas affecting sensor readings.
3. Averaging sensors shall be installed in a serpentine manner vertically across duct. Each bend shall be supported with a capillary clip. Where located in front of filters (e.g. mixed air sensors), access for filter removal shall be maintained.
4. For sensors specified to be calibrated using a dry well bath (see points list), install sensors with a sufficient wiring/flexible conduit lead that sensor may removed from well or duct and placed in an ice bath or dry well for calibration. The spare wiring/flexible conduit shall be no less than 3' in length.
5. All pipe-mounted temperature sensors shall be installed in wells. Install the sensor in the well with a thermal-conducting grease or mastic. Use a closed-cell insulation patch that is integrated into the pipe insulation system to isolate the top of the well from ambient conditions but allow easy access to the sensor. Install a test plug adjacent to all wells for testing and calibration.
6. Unless otherwise noted, temperature sensors/thermostats, humidity sensors/humidistats, CO_2 sensors, and other room wall mounted sensors shall be installed at same centerline as adjacent electrical switches, 4'-0" above the finished floor where there are no adjacent electrical switches, and within ADA limitations.
7. Unless otherwise noted, install outdoor air temperature sensors on north wall, complete with sun shield, where they will not be influenced by building exhaust, exfiltration, or solar insolation. Do not install near intake or exhaust air louvers.

D. Differential Pressure Sensors.

1. Supply Duct Static Pressure: Locate transmitter in temperature control panel near or in DDC panel to which it is wired. Connect the low-pressure port to tee in building pressure (high) signal of the building static pressure transmitter. Pipe the high-pressure tap to the duct using a static pressure tip. Locate static pressure tip as shown on drawings; if no location is shown, locate at end of duct riser or main as far out in the system as possible but upstream of all smoke and fire dampers. Install pressure tips securely fastened with tip facing upstream in accordance with manufacturer's installation instructions.
2. Filter Differential Pressure:

    a. Install static-pressure tips upstream and downstream of filters with tips oriented in direction of flow.
    b. Mount transmitter on outside of filter housing or filter plenum in an accessible position with LCD display clearly visible. This sensor is used in lieu of an analog gauge and thus must be readily viewable.

3. Building Static Pressure:

    a. Low pressure port of the pressure sensor:

        (1) Pipe to the ambient static pressure probe located on the outside and at high point of the building through a high-volume accumulator or otherwise protected from wind fluctuations.

    b. High-pressure port of the pressure sensor:

        (1) Pipe to either:

            a) Behind a DDC temperature sensor cover in an interior zone.
            b) Bosco or Dwyer plate sensor mounted in ceiling.

(2) Do not locate near elevators, exterior doors, atria, or (for ceiling sensor applications) near diffusers.

4. All pressure transducers, other than those controlling VAV boxes, shall be located where accessible for service without use of ladders or special equipment. If required, locate in field device panels and pipe to the equipment monitored or ductwork.
5. The piping to the pressure ports on all pressure transducers (both air and water) shall contain a capped test port located adjacent to the transducer.
6. Piping differential pressure transducers shall have three valve manifold, two valves to allow removal of sensor without disrupting the hydronic system plus an equalizing valve to allow the sensor to be zeroed and to prevent sensor from experiencing full static (as opposed to differential) pressure, plus test plugs on each connection (also used as vents).
7. Copper tubing shall be installed in a neat manner (parallel and perpendicular to the building structure, equipment, piping, etc. from which it is supported) and shall be properly supported. Changes to copper tubing installation resulting from failure to comply with this requirement shall be made at the discretion of the Professional at no additional cost to the Using Agency.

E. Relative Humidity Sensors: Provide element guard as recommended by manufacturer for high velocity installations. For high limit sensors, position remote enough to allow full moisture absorption into the air stream before reaching the sensor.

F. Weather Sensors: Mount wind speed/direction sensor, radiation sensor, and temperature/humidity sensor in fan aspirated enclosure on pipe mount on roof per manufacturer's instructions.

G. Flow Switches: Install in a straight run of pipe at least 10 diameters in length to minimize false indications.

H. Current Switches for Motor Status Monitoring: Adjust so that setpoint is below minimum operating current and above motor no load current.

I. Airflow Measuring Stations: Install per manufacturer's recommendations in an unobstructed straight length of duct both upstream and downstream of sensor, except those installations specifically designed for installation in fan inlet. For installations in fan inlets, provide on both inlets of double inlet fans and provide inlet cone adapter as recommended by AFMS manufacturer.

J. Fluid Flow Sensors: Install per manufacturer's recommendations in an unobstructed straight length of pipe both upstream and downstream of sensor.

K. Window Switches:

1. Wiring:

a. All wiring concealed in mullions and wall cavity to the extent possible. Review wiring routing details in mullions with window manufacturer.
b. Any wiring exposed to view shall be reviewed and approved by Using Agency prior to installation.

2. Where there is more than one switch in a zone, wire in series so that windows are indicated as open when any window is open and indicated as closed when all are closed.

3.5 ACTUATORS

A. Type.

1. Actuators for two-position valves may be pneumatic or electric at the option of the Division 23C contractor.
2. Actuators for high pressure (125 psig) steam, both modulating and two-position, shall be pneumatic.
3. Except where listed above, actuators shall be electric.

B. Mount and link control damper actuators per manufacturer's instructions.

C. Dampers

1. To compress seals when spring-return actuators are used on normally closed dampers, power actuator to approximately 5° open position, manually close the damper, and then tighten the linkage, or follow manufacturers instructions to achieve same effect.
2. Check operation of damper/actuator combination to confirm that actuator modulates damper smoothly throughout stroke to both open and closed positions.
3. Provide all mounting hardware and linkages for actuator installation.

D. Control Valves: Install so that actuators, wiring, and tubing connections are accessible for maintenance. Where possible, install with valve stem axis vertical, with operator side up. Where vertical stem position is not possible, or would result in poor access, valves may be installed with stem horizontal. Do not install valves with stem below horizontal, or down.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. Provide and install the following:

1. Operator Workstations
2. Servers
3. Portable Operator Terminal
4. Uninterruptible Power Supply
5. Backup Device
6. Printers

B. Refer to Section 23 09 00 for general requirements.

1.3 RELATED WORK AND REQUIREMENTS

A. Section 23 09 00 Energy Management and Control System (EMCS) − General

B. Section 23 09 13 EMCS Basic Materials and Devices

C. Section 23 09 19 EMCS Field Panels

D. Section 23 09 23 EMCS Communications Devices

E. Section 23 09 26 EMCS Software and Programming

F. Section 23 09 29 EMCS Points and Sequence of Operation

PART 2 - PRODUCTS

2.1 OPERATOR WORKSTATION (OWS)

A. Hardware:

1. 3.2 GHz (minimum)
2. 4 GB SDRAM (minimum)
3. 8X DVD +/- RW Drive
4. 250 GB hard disk (minimum)
5. Ethernet 100 GB internal network card (for connection to Supervisory LAN)
6. 24” LED HD color, 1920 x 1080 pixel display monitor

7. 3-button optical USB mouse
8. USB Keyboard
9. Internal speakers
10. EnergyStar configured.
11. One spare serial port and one spare USB port in addition to those needed for specified peripherals.
12. 24x7 dedicated technical support service that delivers reduced hold time, direct access to advanced level technicians, and reduced time to resolution, minimum 1 year.

B. Software:

1. By PC Supplier (factory installed):

a. Operating system: Microsoft Windows 7 Professional.
b. Browser: Microsoft Internet Explorer .
c. Office Suite: Microsoft Office Professional.
d. CD burner software: Standard software provided by computer supplier.
e. All software shall be at least the latest version available as of the date of purchase.

2. By EMCS Contractor:

a. See Section 23 09 26.

2.2 CONTROL SYSTEM SERVER (CSS) AND OCCUPANT INTERFACE SERVER (OIS)

A. Hardware:

1. Dual Processor 3.2 GHz (minimum)
2. 4 GB DDRAM (minimum)
3. 4 Bay (1x4) Hot Plug SCSI Hard Drive Backplane with dual 500 GB (minimum) SCSI hard disks connected to on-board 128MB Battery Backed Cache, 2 Internal Ch- Embedded RAID controllers
4. 24X (minimum) CD ROM drive
5. One Ethernet 100 GB internal network card (for connection to Supervisory LAN)
6. One Ethernet 1000 Gigabit NIC-Fiber network card (for connection to Using Agency WAN)
7. Redundant AC power supplies.
8. 19” color , 1280 x 1024 pixel display
9. 3-button optical USB mouse
10. USB Keyboard
11. EnergyStar configured.
12. One spare serial port and one spare USB port in addition to those needed for specified peripherals.
13. 24x7 dedicated technical support service that delivers reduced hold time, direct access to advanced level technicians, and reduced time to resolution, minimum 1 year.
14. Rack mounting.

B. Software:

1. By PC Supplier (factory installed):

a. Operating system: Microsoft Windows Server 2012
b. Browser: Microsoft Internet Explorer
c. All software shall be at least the latest version available as of the date of purchase.

2. By EMCS Contractor:

a. See Section 23 09 26.

C. CSS shall be configured to secure it to the extent practical inside the Supervisory LAN with firewall software provided by the Contractor.

2.3 TREND HISTORIAN SERVER (THS)

A. Same as CSS expect dual 1 TB hard disks.

2.4 PORTABLE OPERATORS TERMINAL (POT)

A. Portable Operators Terminal shall support system management by connection to the controllers, by connection via the Supervisory LAN, Using Agency Intranet, or Internet; or by dial-up communications.

B. Hardware

1. 1.6 GHz (minimum)
2. 4 GB SDRAM (minimum)
3. 250 GB hard disk (minimum)
4. 24X (minimum) CD ROM drive (built-in)
5. Ethernet 100 GB internal network card (for connection to Supervisory LAN)
6. 15.6” color, 1366x768 Anti-Glare WLED-Backlit display
7. Touch pad
8. Rechargeable battery, spare battery and 110V power supply/charger
9. Internal speakers
10. Parallel, Serial and USB port.
11. Vinyl carry-bag.
12. IEEE 802.11b (DSSS) 2.4GHz-Compliant wireless PCMCIA card (compatible with wireless router; see Section 23 09 23).
13. 24x7 dedicated technical support service that delivers reduced hold time, direct access to advanced level technicians, and reduced time to resolution, minimum 1 year.

C. Software:

1. By PC Supplier (factory installed):

a. Operating system: Microsoft Windows 7 Professional.
b. Browser: Microsoft Internet Explorer
c. Office Suite: Microsoft Office Professional.
d. CD burner software: Standard software provided by computer supplier.
e. All software shall be at least the latest version available as of the date of purchase.

2. By EMCS Contractor:

a. See Section 23 09 26.

2.5 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Back-UPS ES battery backup and surge protection.

B. EMI/RFI filtering to FCC Class B

C. Lightning and surge protection for all outlets

D. Stepped sine wave output

E. Wide input voltage range

F. Automatic battery testing

G. Continuous battery monitoring

H. Continuous overload monitoring

I. Sufficient to power all EMCS devices in Central Plant at full load for 5 minutes after power failure.

2.6 BACKUP DEVICE

A. eSATA or USB 3.0 External Hard Drive 1TB (minimum)

B. Include 1 external hard drive

2.7 PRINTERS

A. Network Laser Printer:

1. Print Quality: 1200 x 1200 dpi resolution.
2. Speed: 25 pages per minute; print time of less than 9 seconds to first page.
3. Cartridge / Printhead Duty Cycle: 5000 pages
4. Paper Size: 8.5x11
5. Ethernet Network hardware and software with remote management (configure, monitor and manage printer via network)
6. Compliant Standards:

    a. EPA Energy Star
    b. IEEE 802.3-LAN, IEEE 802.3U-LAN

B. Color Ink Jet printer:

1. Print Quality (Color): 1440 x 720 dpi resolution.
2. Speed: 5 pages per minute (color)
3. Cartridge / Printhead Duty Cycle: 300 pages
4. Paper Size: 11x17, 8.5x11

PART 3 - EXECUTION

3.1 DEVICE REQUIREMENTS

A. Provide the following Equipment in the Control Room or at location designated by the Using Agency:

Device	Quantity
Operator Workstation	3
Control System Server	1
Occupant Interface Server	1
Trend Historian Server	1
Portable Operator's Terminal	2
Interruptible Power Supply	As required
Backup device	1
Network Laser Printer	1
Color Inkjet Printer	1
Alarm Dot Matrix Printer	1

3.2 INSTALLATION

A. Install all servers and other devices available with a rack mounting configuration in a rack (provided by Contractor) located in the Control Room.

B. Install all hardware and software and configure all devices in accordance with manufacturer's instructions.

C. Provide all licenses, keys, etc. and all documentation and information required to install, configure, operate, diagnose and maintain the system shall be provided.

D. Network connections:

1. See System Architecture in Section 23 09 00.
2. Connect OWSs, CSS, OIS, and THS to Supervisory LAN.
3. Connect CSS, OIS, and THS to Using Agency IT WAN/LAN via fiber optic cable. Contractor shall coordinate with the Using Agency representative to establish IP addresses and communications parameters to assure proper operation.

E. Printers:

1. Connect network laser printer to Supervisory LAN.
2. Connect alarm printer to CSS.
3. Connect other printers to an OWS and configure to share with other OWSs.

F. Backup

1. After completion and acceptance of installation, create a tape backup of all OWSs and server database and configuration files for permanent record of initial installation.
2. Configure tape backup software to provide automatic backup of CSS and THS on a weekly basis.
3. All other backup configuration shall be by the Using Agency.

G. Anti-virus software and installation shall be by the Using Agency.

END OF SECTION 23 09 16

SECTION 23 09 19 - EMCS FIELD PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. Provide and install the following:

1. Building Controller (BC)
2. Advance Application Specific Controller (AAC)
3. Application Specific Controller (ASC)
4. Lighting Control Panel (LCP)

B. Refer to Section 23 09 00 for general requirements.

1.3 RELATED WORK AND REQUIREMENTS

A. Section 23 09 00 Energy Management and Control System (EMCS) − General

B. Section 23 09 13 EMCS Basic Materials and Devices

C. Section 23 09 16 EMCS Operator Interfaces

D. Section 23 09 23 EMCS Communications Devices

E. Section 23 09 26 EMCS Software and Programming

F. Section 23 09 29 EMCS Points and Sequence of Operation

G. Section 23 09 33 EMCS Commissioning

PART 2 - PRODUCTS

2.1 GENERAL

A. Point information from any controller (including BCs, AACs, and ASCs) and from any gateway shall be capable of being used in a control sequence in any other panel. The use of OWS or CSS to serve as a communications server between control panels and gateways is not acceptable.

B. For all controllers, operating configuration and software shall be retained in the event of a power outage without requiring a download from upper level controllers by one or a combination of the following:

1. Volatile RAM shall have a replaceable battery backup using a lithium battery with a rated service life of 10,000 hours continuous, and a rated shelf life of at least 7 years.
2. Volatile RAM shall have a automatically rechargeable battery backup using a lithium battery with a rated service life of 50 hours continuous, and a rated shelf life of at least 10 years.
3. EEPROM, EPROM, or NOVROM non-volatile memory

C. Controllers shall allow independent operation regardless of the status of the other controllers or OWS or CSS. All energy management logic shall reside in field hardware and shall not be dependent on the OWS or CSS for operation.

D. Each controller shall continually check the status of its processor and memory circuits. If an abnormal operation is detected, the controller shall:

1. Assume a predetermined failure mode.
2. Generate an alarm notification to the master controller and/or Operator Workstation.

E. All input points and output points shall be protected such that shorting of the point to itself — to another point, or to ground — will cause no damage to the controller. All input and output points shall be protected from voltage up to 24V of any duration, such that contact with this voltage will cause no damage to the controller.

F. Controller hardware shall be suitable for the anticipated ambient conditions.

1. Controllers used outdoors and/or in wet ambient conditions shall be mounted within waterproof enclosures, and shall be rated for operation at 0°F to 150°F.
2. Controllers used in conditioned space shall be mounted in dust--resistant enclosures, and shall be rated for operation at 32°F to 120°F.

G. Programmability. All controllers, including BCs, AACs, and ASCs, shall be fully user programmable. See Section 23 09 26. Configurable pre-programmed logic shall not be acceptable in any controller. (This is required due to non-standard control sequences at AHUs and VAV terminal units.)

2.2 STAND-ALONE FUNCTIONALITY

A. General: These requirements clarify the requirement for stand-alone functionality relative to packaging I/O devices with a controller. Stand-alone functionality is specified with the controller and for each Application Category specified in Part 3. This item refers to acceptable paradigms for associating the points with the processor.

B. Functional Boundary: Provide controllers so that all points associated with and common to one unit or other complete system/equipment shall reside within a single control unit. The boundaries of a standalone system shall be as dictated in the contract documents. Generally systems specified for the Application Category will dictate the boundary of the standalone control functionality. See related restrictions below. When referring to the controller as pertains to the standalone functionality, reference is specifically made to the processor. One processor shall execute all the related I/O control logic via one operating system that uses a common programming and configuration tool.

C. The following configurations are considered acceptable with reference to a controller’s standalone functionality:

1. Points packaged as integral to the controller such that the point configuration is listed as an essential piece of information for ordering the controller (having a unique ordering number).
2. Controllers with processors and modular back planes that allow plug in point modules as an

integral part of the controller.

3. I/O point expander boards, plugged directly into the main controller board to expand the point capacity of the controller

D. The following configurations are considered unacceptable with reference to a controller's standalone functionality:

1. Multiple controllers enclosed in the same control panel to accomplish the point requirement.

2.3 BUILDING CONTROLLER (BC)

A. General Requirements:

1. BCs shall be peer-to-peer devices connected to the Primary Controller LAN.
2. Each BC shall be capable of standalone direct digital operation utilizing its own microprocessor, internal RAM, non-volatile memory, input/output, wiring terminal strips, A/D converters, real-time clock/calendar and voltage transient and lightning protection devices, battery backup, regulated power supply, power conditioning equipment, ports for connection of operating interface devices, and control enclosure.. Refer to standalone functionality specified above.
3. The BC(s) shall provide fully distributed control independent of the operational status of the OWSs and CSS. All necessary calculations required to achieve control shall be executed within the BC independent of any other device.
4. BCs shall perform overall system coordination, accept control programs, perform automated HVAC functions, control peripheral devices and perform all necessary mathematical and logical functions. BCs shall share information with the entire network of BCs and AACs/ASCs for full global control. Each controller shall permit multi-user operation from multiple workstations and portable operator terminals connected either locally or over the Primary Controller LAN.
5. BC shall contain sufficient memory for all specified global control strategies, user defined reports and trending, communication programs, and central alarming.
6. The BC may provide for point mix flexibility and expandability. This requirement may be met via either a family of expander boards, modular input/output configuration, or a combination thereof. Refer to stand alone functionality specified above.
7. All BC point data, algorithms and application software shall be configurable, and all control strategies performed by the BC shall be both operator definable and modifiable, from Operator Interfaces. The point database and all application programs shall be stored in non-volatile or battery backed volatile memory within the BC and will be able to upload/download to/from the OWS and/or CSS.
8. BC shall provide buffer for holding alarms, messages, trends etc.
9. Each BC shall include self-test diagnostics, which allow the BC to automatically alarm any malfunctions, or alarm conditions that exceed desired parameters as determined by programming input.
10. Each BC shall contain software to perform full DDC/PID control loops.
11. Memory

a. Memory for data trending shall reside in BCs; the Operator Workstation shall not need to be connected for data trending to occur. Memory shall be large enough to record 256 records of each hardware point on the panel and an equal number of software points, each record to include both data value and time of occurrence. (See Section 23 09 26 for trending software requirements.)
b. Provide sufficient internal memory for the specified sequences of operation and trend logging. There shall be a minimum of approximately 25% of available memory free for future programming changes.

c. Provide an additional BC if needed to comply with this section.

12. For systems requiring end-of-line resistors those resistors shall be located in the BC.
13. Input-Output Processing

    a. Digital Outputs (DO): Outputs shall be rated for a minimum 24 Vac or Vdc, 0.5 amp maximum current. Each shall be configurable as normally open or normally closed. Each output shall have an LED to indicate the operating mode of the output and a supervised manual hand off or auto (HOA) switch to allow for override. HOA override switches shall be monitored via additional input channels to provide dynamic indication of the switch status at any Operator Interface. Each DO shall be discrete outputs from the BC's board (multiplexing to a separate manufacturer's board is unacceptable). Provide suppression to limit transients to acceptable levels.
    b. Analog Inputs (AI): AI shall be 0-5 Vdc, 0-10 Vdc, and 0-20 mA. Provide signal conditioning, and zero and span calibration for each input. Each input shall be a discrete input to the BC's board (multiplexing to a separate manufacturers board is unacceptable unless specifically indicated otherwise). A/D converters shall have a minimum resolution of 12 bits.
    c. Digital Inputs (DI): Monitor dry contact closures. Accept pulsed inputs of at least one per second. Source voltage for sensing shall be supplied by the BC and shall be isolated from the main board. Software multiplexing of an AI and resistors is unacceptable.
    d. Universal Inputs (UI-AI or DI): To serve as either AI or DI as specified above.
    e. Electronic Analog Outputs (AO): Voltage mode: 0-5 Vdc and 0-10 Vdc; Current mode: 4-20 mA. Provide zero and span calibration and circuit protection. Pulse Width Modulated (PWM) analog is not acceptable. D/A converters shall have a minimum resolution of 8 bits. Each output shall have an LED to indicate the operating mode of the output and a supervised manual hand off or auto (HOA) switch and trim potentiometer to allow for override and manual positioning of the output from 0 to 100%. HOA override switches shall be monitored via additional input channels to provide dynamic indication of the switch status at any Operator Interface.
    f. Analog Output Pneumatic (AOP), 0-20 psi: Pneumatic outputs via an I/ or V/P transducer. Multiplexed digital to pneumatic transducers are acceptable provided they are supplied as a standard product and part of the BC and provide individual feedback. Multiplexed pneumatic outputs of a separate manufacturer are unacceptable.
    g. Pulsed Inputs: Capable of counting up to 8 pulses per second with buffer to accumulate pulse count. Pulses shall be counted at all times.

14. A communication port for operator interface through a terminal shall be provided in each BC. It shall be possible to perform all program and database back-up, system monitoring, control functions, and BC diagnostics through this port. Standalone BC panels shall allow temporary use of portable devices without interrupting the normal operation of permanently connected modems, printers, or workstations.
15. Each BC shall be equipped with loop tuning algorithm for precise proportional, integral, derivative (PID) control. Loop tuning tools provided with the Operator Workstation software is acceptable. In any case, tools to support loop tuning must be provided such that P, I, and D gains are automatically calculated.
16. All analog output points shall have a selectable failure setpoint. The BC shall be capable of maintaining this failure setpoint in the event of a system malfunction, which causes loss of BC control, or loss of output signal, as long as power is available at the BC. The failure setpoint shall be selectable on a per point basis.
17. Slope intercepts and gain adjustments shall be available on a per-point basis.
18. BC Power Loss:

    a. Upon a loss of power to any BC, the other units on the primary controlling network shall

not in any way be affected.

b. Upon a loss of power, all software, database parameters, and data (except trend data) shall be protected from memory loss per paragraph 2.1B.
c. Upon restoration of power within the specified battery backup period, the BC shall resume full operation without operator intervention. The BC shall automatically reset its clock such that proper operation of any time dependent function is possible without manual reset of the clock. All monitored functions shall be updated.
d. Should the duration of a loss of power exceed the specified battery back-up period or BC panel memory be lost for any reason, the panel shall automatically report, or CSS shall automatically determine, the condition (upon resumption of power) and be capable of receiving a download via the network, and connected computer. In addition, the Using Agency shall be able to upload the most current versions of all energy management control programs, Direct Digital Control programs, database parameters, and all other data and programs in the memory of each BC to the operator workstation via the local area network, or via the telephone line dial-up modem where applicable, or to the laptop PC via the local RS-232C port.

19. BC Failure:

a. Controller LAN Data Transmission Failure: BC shall continue to operate in stand-alone mode. BC shall store loss of communication alarm along with the time of the event. All control functions shall continue with the global values programmable to either last value or a specified value.
b. BC Hardware Failure: BC shall cease operation and terminate communication with other devices. All outputs shall go to their specified fail position.

20. Each BC shall be equipped with firmware resident or software self-diagnostics for sensors and be capable of assessing an open or shorted sensor circuit and taking an appropriate control action (close valve, damper, etc.).
21. BCs may include LAN communications interface functions for controlling s\Secondary controlling LANs Refer to Section 23 09 23 - EMCS System Communications Devices for requirements if this function is packaged with the BC.
22. BCs shall be mounted on equipment, in packaged equipment enclosures, or locking wall mounted in a NEMA 1 enclosure, as specified elsewhere.

B. BACnet Building Controller Requirements:

1. The BC(s) shall support all BIBBs defined in the BACnet Building Controller (B-BC) device profile as defined in the BACnet standard.
2. Each BC shall be connected to the BACnet Primary Controller LAN communicating to/from other BCs.

2.4 ADVANCED APPLICATION SPECIFIC CONTROLLER (AAC) AND APPLICATION SPECIFIC CONTROLLER (ASC)

A. General Requirements:

1. AACs and ASCs shall be connected to the Primary or Secondary Controller LAN.
2. AACs and ASCs shall provide intelligent, standalone control of HVAC equipment. Each unit shall have its own internal RAM, non-volatile memory and will continue to operate all local control functions in the event of a loss of communications on the Secondary LAN. Refer to standalone requirements by application specified in Part 3 of this section. In addition, it shall be able to share information with every other BC and AAC /ASC on the entire network.
3. Each AAC and ASC shall include self-test diagnostics that allow the AAC /ASC to

automatically relay to the BC, LAN Interface Device or workstation, any malfunctions or abnormal conditions within the AAC /ASC or alarm conditions of inputs that exceed desired parameters as determined by programming input.

4. AACs and ASCs shall include sufficient memory to perform the specific control functions required for its application and to communicate with other devices.
5. Each AAC and ASC must be capable of stand-alone direct digital operation utilizing its own processor, non-volatile memory, input/output, voltage transient and lightning protection devices.
6. All point data; algorithms and application software within an AAC /ASC shall be modifiable from Operator Interfaces.
7. Memory

    a. Memory for data trending is not required for AACs and ASCs. If not provided in controller, memory for trend data shall reside in BCs connected to the same Network.
    b. Provide sufficient internal memory for the specified sequences of operation. For AACs, there shall be a minimum of approximately 25% of available memory free for future programming changes. Provide additional AACs or a BC if needed to comply with this requirement.

8. AAC Input-Output Processing. Same as BCs (paragraph 2.3A.13) except A/D converters may be 10 bit.
9. ASC Input-Output Processing

    a. Digital Outputs (DO): Outputs shall be rated for a minimum 24 Vac or Vdc, 0.5 amp maximum current. Each shall be configurable as normally open or normally closed. Each output shall have an LED to indicate the operating mode of the output. Each DO shall be discrete outputs from the ASC's board (multiplexing to a separate manufacturer's board is unacceptable). Provide suppression to limit transients to acceptable levels.
    b. Analog Inputs (AI): AI shall be 0-5 Vdc or direct thermistor connection. Provide signal conditioning, and zero and span calibration for each input. Each input shall be a discrete input to the ASC's board (multiplexing to a separate manufacturers board is unacceptable unless specifically indicated otherwise). A/D converters shall have a minimum resolution of 10 bits.
    c. Digital Inputs (DI): Monitor dry contact closures. Accept pulsed inputs of at least one per second. Source voltage for sensing shall be supplied by the ASC and shall be isolated from the main board. Software multiplexing of an AI and resistors may only be done in non-critical applications and only with prior approval of the Using Agency.
    d. Universal Inputs (UI-AI or DI): To serve as either AI or DI as specified above.
    e. Electronic Analog Outputs (AO): Voltage mode: 0-5 Vdc and 0-10 Vdc; Current mode: 4-20 mA. Provide zero and span calibration and circuit protection. Pulse Width Modulated (PWM) analog is not acceptable. D/A converters shall have a minimum resolution of 8 bits.
    f. Analog Output Pneumatic (AOP), 0-20 psi: Pneumatic outputs via an I/ or V/P transducer. Multiplexed digital to pneumatic transducers are acceptable provided they are supplied as a standard product and part of the ASC and provide individual feedback. Multiplexed pneumatic outputs of a separate manufacturer are unacceptable.

B. BACnet AAC(s) and ASC(s) Requirements:

1. The AAC(s) and ASC(s) shall support all BIBBs defined in the BACnet Building Controller (B-AAC and B-ASC) device profile as defined in the BACnet standard.
2. AAC(s) and ASC(s) shall communicate over the BACnet Primary Controller LAN or the Secondary LAN.

2.5 LIGHTING CONTROLS

A. General:

1. Lighting control hardware shall consist of lighting control panels and gateway (if required) to DDC system.

B. Overrides

1. Occupant override

a. Off-hour override control shall be via web browser through the Using Agency Intranet (see Section 23 09 26).
b. Low voltage wall switches as indicated on Division 26 Electrical drawings.

2. Janitor’s override

a. Provide momentary contact Janitor’s switch in one janitor’s closets per floor.
b. Switches shall be programmable to allow lights to be sequenced on by blocks to minimize the number of lights on at any one time. Program to turn on sufficient circuits to provide adequate lighting for cleaning during tenant improvements.

c. Timed to shut off lights after adjustable time period.

C. Each LCP (Lighting Control Panel) consists of a fully programmable controller operating in conjunction with low voltage relays which provide stand-alone or integrated lighting functions such as time scheduling, "flick" signals, ambient light control, cleaning schedules. Programming is provided either through the Operator Workstation or Portable Operator's Terminal. Each controller shall be capable of providing all logic, control runtime data, status information and communications functions for each lighting control relay. Each relay is "softwired" into any desired group and into common groups by the Portable Operator's Terminal, or Operator Workstation.

D. Each LCP enclosure includes multiple GE RR7 (or equal) pre-mounted relays, logic boards, terminals, power supplies, transformers, local override switches and a wiring schedule directory. Relays shall be momentarily-pulsed, mechanically latching contactors rated at 20 amps, 120-277 VAC. Enclosure shall have lockable hinged door.

E. Power supply shall have a transformer assembly with two 40 VA transformers, with separate secondaries, one providing power to relays, LED's and associated low voltage switches and occupancy sensors, the second providing power to intelligence cards. Transformers include internal overcurrent protection with automatic reset and metal oxide varistor protection against power spikes.

F. All lighting sequences programmed in the LCPs shall be stored in non-volatile EEPROM memory, which is not dependent upon the presence of a battery to be retained. Each LCP shall communicate with the Operator Workstation at a baud rate of not less than 19,200 baud.

G. LCPs shall be capable of supporting the following scenarios: Schedule with Flick Warn, Time Delay Overrides with Flick Warn, Common Area Interlock with Egress Timer, Master Switch Control with Flick Option, Cleaning Lights, Automatic Daylight Switching with Occupant Interlock/Override, Status and Runtime Data and Touch Tone Phone interface.

H. All relay changes of state and programmable switch actions shall be communicated over the network LAN to support interactive graphics and on line status monitoring. All programming shall be

on line or off line through the Portable Operator's Terminal or Operator Workstation.

I. Each LCP shall be capable of stand alone operation. None of the operating scenarios discussed above shall depend on the operation of a Operator Workstation or Portable Operator's Terminal. The relays override switches shall continue to operate should the LCP controller fail.

J. Each LCP shall have framed, plastic-encased point list for all points in cabinet.

K. Manufacturer: Equal to Triatek with Triatek Link Gateway.

PART 3 - EXECUTION

3.1 GENERAL

A. Install systems and materials in accordance with manufacturer's instructions, specifications roughing-in drawings and details shown on drawings.

3.2 HARDWARE APPLICATION REQUIREMENTS

A. General: The functional intent of this specification is to allow cost effective application of manufacturers standard products while maintain the integrity and reliability of the control functions. A BC as specified above is generally fully featured and customizable whereas the AAC/ASC refers to a more cost-effective unit designed for lower-end applications. Specific requirements indicated below are required for the respective application. Manufacturer may apply the most cost-effective unit that meets the requirement of that application.

B. Software Capability: Regardless of application category listed below, each Control Unit shall be capable of performing the specified sequence of operation for the associated equipment. All physical point data and calculated values required to accomplish the sequence of operation shall originate within the associated CU with only the exceptions enumerated below. Refer to Paragraph 2.2 above for physical limitations of standalone functionality. Listed below are functional point data and calculated values that shall be allowed to be obtained from or stored by other CUs via LAN.

1. Remote pressure sensors. To meet the requirements of this section, differential pressure sensors controlling fans and pumps shall either be home-run wired back to the CU controlling the fan/pump VFD; or install another DP sensor (not shown in points list) near the fan/pump and connected to the CU controlling the pump, connect remote sensors to remote CUs, and use cascading control loops (remote sensor loops reset setpoint for local sensor loop via the network, and local sensor loop controls the pump/fan).

C. Where associated control functions involve functions from different categories identified below, the requirements for the most restrictive category shall be met.

D. Application Category 0 (Distributed Monitoring)

1. Applications in this category include the following:

a. Monitoring of variables that are not used in a control loop, sequence logic, or safety. Examples include status of sump pumps or associated float switches, temperatures in monitored electrical rooms.

2. Applicable Controllers: Available points on conveniently located BCs, AACs, and ASCs may

be used in these applications.

3. Contractor shall verify and document that the network bandwidth is acceptable to accept specified trends of monitored points.

E. Application Category 1 (Application Specific Controller):

1. Applications in this category include the following:

   a. Fan Coil Units
   b. Terminal Units (e.g. VAV and Constant Volume Boxes)
   c. Miscellaneous heaters
   d. Constant speed exhaust fans and pumps
   e. Unitary single zone units with self contained controls (Package Terminal AC Units, Package Terminal Heat Pumps, Split-System AC Units, Split-System Heat Pumps, Water-Source Heat Pumps, Computer Room AC units)

2. Applicable Controllers: ASCs may be used in these applications .
3. Standalone Capability: Provide capability to execute control functions for the application for a given setpoint or mode, which shall generally be occupied mode control. Only the following data (as applicable) may be acquired from other controllers via LANs. In the event of a loss of communications with any other controller, or any fault in any system hardware that interrupts the acquisition of any of these values, the ASC shall use the last value obtained before the fault occurred. If such fault has not been corrected after the specified default delay time, specified default value(s) shall then be substituted until such fault has been corrected.

Physical/Virtual Point	Default Value
Time of day	Occupied
Scheduling Mode	Occupied
Morning Warm-Up	Off (cold discharge air)
Load Shed	Off (no shedding)
Trend Data	N/A

4. Mounting:

   a. ASCs that control equipment located above accessible ceilings shall be mounted on the equipment in an accessible enclosure and shall be rated for plenum use if ceiling attic is used as a return air plenum.
   b. ASCs that control equipment mounted in a mechanical room may either be mounted in/on the equipment, or on the wall of the mechanical room at an adjacent, accessible location.
   c. ASCs that control equipment mounted outside or in occupied spaces shall either be located in the unit or in a proximate mechanical/utility space.
   d. Division 23C contractor shall furnish ASCs to the VAV terminal unit manufacturer for factory mounting.

5. Mounting: LAN Restrictions: Limit the number of nodes on the network to the maximum recommended by the manufacturer.
6. Trending Restrictions: BCs connected to same Network shall be capable of storing trend data for points associated with ASCs and must still meet the requirement of paragraph 2.3A.11, or special purpose trend storage devices meeting the requirement of paragraph 2.3A.11 for ASC points must be added for this purpose.

F. Application Category 2 (Advanced Application Controller)

1. Applications in this category include the following:

    a. Unitary VAV AC Unit with self contained controls
    b. Single Zone Air Handling Units
    c. Constant or variable speed pump station
    d. DHW Converter control/monitoring

2. Applicable Controllers:

    a. BCs may be used in these applications.
    b. AACs may be used in these applications provided the AAC meets all requirements specified below and all control functions and physical I/O associated with a given unit resides in one AAC.

3. Standalone Capability: Only the following data (as applicable) may be acquired from other AACs or BCs via LANs. In the event of a loss of communications with any other AACs, or any fault in any system hardware that interrupts the acquisition of any of these values, the AAC shall use the last value obtained before the fault occurred. If such fault has not been corrected after the specified default delay time, specified default value(s) shall then be substituted until such fault has been corrected.

Physical/Virtual Point	Default Delay Time	Default Value
Outside Air Temperature	3 minutes	80˚F
Trend Data		N/A

4. Trending Restrictions for AACs: BCs connected to same Network shall be capable of storing trend data for points associated with AACs that do not have on-board trend storage capability, and must still meet the requirement of paragraph 2.3A.11, or special purpose trend storage devices meeting the requirement of paragraph 2.3A.11 for AAC points must be added for this purpose.
5. Mounting:

    a. AACs/BCs that control equipment located above accessible ceilings shall be mounted in a NEMA 1, locking enclosure and shall be rated for plenum use if ceiling attic is used as a return air plenum.
    b. AACs/BCs that control equipment located in occupied spaces or outside shall either be mounted within the equipment enclosure (responsibility for physical fit remains with the Contractor) or in a proximate mechanical/utility room in which case it shall be enclosed in a NEMA 1, locking enclosure.

G. Application Category 3 (Building Controller)

1. Applications in this category include the following:

    a. VAV Air Handlers
    b. Central Cooling Plant
    c. Central Heating Plant

2. Applicable Controllers: BCs shall be used in these applications.
3. Mounting: See 3.2F.5.

3.3 LIGHTING PANELS

A. See Division 26 Electrical drawings for quantity of lighting panels and relays. Include spare relays called for on Electrical drawings.

B. See 23 09 00 for coordination with Division 26 contractor with respect to installation and wiring of panels and field mounted switches.

C. Provide BACnet gateway or router (if required) between lighting panels and Primary or Supervisory LAN. Map over all points to the EMCS.

D. See Section 23 09 26 for software and graphics requirements.

3.4 CONTROL POWER

A. Refer to Section 23 09 00 for power to control panels,

END OF SECTION 23 09 19

SECTION 23 09 23 - EMCS COMMUNICATION DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. Provide and install the following:

1. LAN Interface Devices/Routers
2. Wireless Routers
3. Modems
4. BACnet Gateways
5. Electrical Power System Gateway
6. Variable Speed Drive Gateway

B. Refer to Section 23 09 00 for General Requirements.

1.3 RELATED WORK AND REQUIREMENTS

A. Section 23 09 00 Energy Management and Control System (EMCS) − General

B. Section 23 09 13 EMCS Basic Materials and Devices

C. Section 23 09 16 EMCS Operator Interfaces

D. Section 23 09 19 EMCS Field Panels

E. Section 23 09 26 EMCS Software and Programming

F. Section 23 09 29 EMCS Points and Sequence of Operation

PART 2 - PRODUCTS

2.1 CONTROLLER LOCAL AREA NETWORK INTERFACE DEVICES (LANID)

A. The Controller LANID shall be a microprocessor-based communications device which acts as a gateway/router between the Primary LAN, Secondary LAN, an operator interface, modem to support remote operator interface, or printer. These may be provided within a BC or as a separate device.

B. The LANID shall perform information translation between the Primary LAN and the Secondary LAN, supervise communications on a polling secondary LAN, and shall be applicable to systems in which the same functionality is not provided in the BC. In systems where the LANID is a separate device,

it shall contain its own microprocessor, RAM, battery, real-time clock, communication ports, and power supply as specified for a BC in Section 23 09 19. Each LANID shall be mounted in a lockable enclosure.

C. Each LANID shall support interrogation, full control, and all utilities associated with all BCs on the Primary LAN, all AACs and ASCs connected to all secondary LANs under the Primary Controller LAN, and all points connected to those PCUs and SCUs.

D. Upon loss of power to a LANID, the battery shall provide for minimum 100-hour backup of all programs and data in RAM. The battery shall be sealed and self-charging.

E. The LANID shall be transparent to control functions and shall not be required to control information routing on the Primary LAN

2.2 SUPERVISORY LAN ROUTERS

A. The Supervisory Router shall be a microprocessor-based communications device that acts as a router between the Supervisory LAN CSSs or OWS and the Primary LAN.

B. The Supervisory Router shall not perform information translation. Both Primary LAN and the Supervisory LAN shall use BACnet.

C. The Supervisory Router shall contain its own microprocessor, RAM, communication ports, and power supply. Each Supervisory Router shall be mounted in a lockable enclosure

D. The Supervisory Router shall allow centralized overall system supervision, operator interface, management report generation, alarm annunciation, acquisition of trend data, and communication with control units. It shall allow system operators to perform the following functions from the CSS, OWSs, and POTs:

1. Configure systems.
2. Monitor and supervise control of all points.
3. Change control setpoints.
4. Override input values.
5. Override output values
6. Enter programmed start/stop time schedules.
7. View and acknowledge alarms and messages.
8. Receive, store and display trend logs and management reports.
9. Upload/Download programs, databases, etc. as specified.

E. Upon loss of power to the Supervisory Router, the battery shall provide for minimum 100-hour backup of all programs and data in RAM. The battery shall be sealed and self-charging.

F. The Supervisory Router shall be transparent to control functions and shall not be required to control information routing on the Primary LAN

2.3 MODEMS

A. None required.

2.4 BACnet BROADCAST MESSAGE ROUTING

A. To allow BACnet broadcast messages to be relayed from remote nodes communicating via the internet and connecting to the Supervisory Router through IP protocol, a BACnet/IP Broadcast Management Device (BBMD) shall be provided which conforms to the Annex J definition of the BACnet standard for two-hop distribution. Multicast messaging or one-hop distribution requiring configuration of IP routers which are not part of the EMCS vendor's cope in not acceptable.

2.5 BACNET GATEWAYS

A. Gateways shall be provided to link non-BACnet control products to the BACnet inter-network. All of the functionality described in this section is to be provided by using the BACnet capabilities. Each Gateway shall have the ability to expand the number of BACnet objects of each type supported by 20% to accommodate future system changes.

B. Each Gateway shall provide values for all points on the non-BACnet side of the Gateway to BACnet devices as if the values were originating from BACnet objects. The Gateway shall also provide a way for BACnet devices to modify (write) all points specified by the AOC using standard BACnet services. All points are required to be writable for each site.

C. The Gateway shall implement BACnet schedule objects and permit both read and write access to the schedules from the workstation.

D. Each Gateway shall provide a way to collect and archive or trend (time, value) data pairs.

E. Each Gateway and any devices that the Gateway represents which have time-of-day information shall respond to workstation requests to synchronize the date and time. Each Gateway and any devices that the Gateway represents shall support dynamic device binding and dynamic object binding.

F. All points in the system shall be made network visible through the use of standard BACnet objects or through proprietary BACnet extensions that the workstation also supports. All points shall be writable using standard BACnet services.

G. All devices have a Device Object instance number that is unique throughout the entire inter-network. All BACnet devices shall be configured with a Device Object instance number that is based on the format specified (shown in decimal notation). This includes all physical devices as well as any logical BACnet devices that are physically represented by Gateways.

H. All BACnet Interoperability Building Blocks (BIBBs) are required to be supported for each native BACnet device or Gateway. The Gateway shall support all BIBBs defined in the BACnet Gateway's device profile as defined in the BACnet standard.

I. Upon loss of power to a Gateway, the battery shall provide for minimum 1000-hour backup of all programs and data in RAM. The battery shall be sealed and self-charging.

J. UL 916 CE FCC part 15 Subpart B – Class A with surge and transient protection circuitry for power and communications..

2.6 ELECTRICAL POWER SYSTEM GATEWAY

A. BACnet Gateway device per paragraph 2.3 to provide bi-directional communications and translation between electrical system switchgear and meter system and EMCS.

B. Device shall convert Modbus EIA-485 to BACnet on Supervisory LAN protocol.

2.7 VARIABLE SPEED DRIVE GATEWAY

A. VFDs shall include a BACnet/MSTP bi-directional gateway specified under Division 23.

PART 3 - EXECUTION

3.1 GENERAL

A. Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details shown on drawings.

B. Contractor shall provide all interface devices and software to provide an integrated system.

C. See Control Power in Section 23 09 00 for device power options and requirements.

3.2 LANID AND LAN ROUTERS

A. Provide as required. See System Architecture in Section 23 09 00.

B. At each building, connect Supervisory LAN to dedicated control system fiber optic cable via 100Base-T to 100/1000Base-SX/LX fiber media converter installed in NEMA 1 enclosure or rack mounted in BDF rooms.

C. Connect networks to both sides of device.

D. Thoroughly test to ensure proper operation.

E. Interruptions or fault at any point on any Primary Controller LAN shall not interrupt communications between other nodes on the network. If a LAN is severed, two separate networks shall be formed and communications within each network shall continue uninterrupted. The system shall automatically monitor the operation of all network devices and annunciate any device that goes off-line because it is failing to communicate.

3.3 GATEWAYS

A. General

1. Wire to networks on both sides of device.
2. Map across all monitoring and control points listed in Section 23 09 29.
3. Thoroughly test each point to ensure that mapping is accurate.
4. Initiate trends of points as indication in Section 23 09 29.

B. Electrical Power System Gateway

1. Install gateway in NEMA 1 enclosure in electrical room.
2. Connect to Modbus interface to electrical system PLC in location shown on Division 26 Electrical Drawings.

C. Variable Speed Drive Gateway

1. Install gateway in local EMCS panel or in separate NEMA 1 enclosure in convenient mechanical or electrical room.
2. Connect to Modbus RS-485 terminations provided with each variable speed drive by Division 23. See Division 23 Mechanical Drawings for locations.

D. Lighting Control

1. Provide BACnet gateway if required by lighting control system.

END OF SECTION 23 09 23

SECTION 23 09 26 - EMCS SOFTWARE AND PROGRAMMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. Provide and install the following:

1. System Software
2. Programming Software
3. Graphical User Interface Software

B. Refer to Section 23 09 00 for general requirements.

1.3 RELATED WORK AND REQUIREMENTS

A. Section 23 09 00 Energy Management and Control System (EMCS) − General

B. Section 23 09 13 EMCS Basic Materials and Devices

C. Section 23 09 16 EMCS Operator Interfaces

D. Section 23 09 19 EMCS Field Panels

E. Section 23 09 23 EMCS Communication Devices

F. Section 23 09 29 EMCS Points and Sequence of Operation

G. Section 23 05 93 Testing, Adjusting, and Balancing

1.4 GENERAL

A. System software shall be based on server/thin-client architecture, designed around the open standards of web technology. Servers shall be accessed using a web browser over the control system Supervisory LAN, the Using Agency intranet, and remotely over the Internet (through the Using Agency IT WAN/LAN).

B. The intent of the thin-client architecture is to provide operators complete access to the EMCS via a web browser GUI. No special software other than a web browser (including active-x components or fat java clients) shall be required to be installed on OIs used to access the EMCS graphics, point displays, trends, and trend configuration. Additional software other than a browser may be used to configure or modify the EMCS and programming.

C. The Contractor shall furnish and install all software and programming necessary to provide a complete and functioning system as specified. The Contractor shall include all software and programming not specifically itemized in these specifications that is necessary to implement, maintain, operate, and diagnose the system in compliance with these specifications.

D. Software Components: All software components of the BAS system software shall be installed and completed in accordance with the specification. BAS system components shall include:

1. Server Software, Database and Web Browser Graphical User Interface
2. System Configuration Utilities for future modifications to the system
3. Graphical Programming
4. Direct digital control software
5. Application Software

E. Database Open Connectivity: The BAS server database shall be Java DataBase Connectivity (JDBC) compatible, allowing real time access of data via XML/SOAP.

1.5 LICENSING

A. Include licensing and hardware keys for all software packages at all workstations (OWSs and POTs) and servers.

B. Within the limitations of the servers, any number of users shall have web access to the CSS and THS at any given time.

C. All operator interface, programming environment, networking, database management and any other software used by the Contractor to install the system or needed to operate the system to its full capabilities shall be licensed and provided to the Using Agency.

D. All operator software, including that for programming and configuration, shall be available on all workstations. Hardware and software keys to provide all rights shall be installed on all workstations.

PART 2 - PRODUCTS

2.1 CONTROLLER SOFTWARE

A. BC Software Residency: Each BC shall be capable of control and monitoring of all points physically connected to it. All software including the following shall reside and execute at the BC:

1. Real-Time Operating System software
2. Real-Time Clock/Calendar and network time synchronization
3. BC diagnostic software
4. LAN Communication software/firmware
5. Direct Digital Control software
6. Alarm Processing and Buffering software
7. Energy Management software
8. Data Trending, Reporting, and Buffering software
9. I/O (physical and virtual) database
10. Remote Communication software

B. AAC/ASC Software Residency: Each AAC/ASC shall be capable of control and monitoring of all points physically connected to it. As a minimum, software including the following shall reside and execute at the AAC/ASC. Other software to support other required functions of the AAC/ASC may

reside at the BC or LAN interface device (specified in Section 23 09 23) with the restrictions/exceptions per application provided in Section 23 09 19:

1. Real-Time Operating System software
2. AAC/ASC diagnostic software
3. LAN Communication software
4. Control software applicable to the unit it serves that will support a single mode of operation
5. I/O (physical and virtual) database to support one mode of operation

C. Stand Alone Capability: BC shall continue to perform all functions independent of a failure in other BC/AAC/ASC or other communication links to other BCs/AACs/ASCs. Trends and runtime totalization shall be retained in memory. Runtime totalization shall be available on all digital input points that monitor electric motor status. Refer also to Section 23 09 19 for other aspects of stand alone functionality.

D. Operating System: Controllers shall include a real-time operating system resident in ROM or EEPROM. This software shall execute independently from any other devices in the system. It shall support all specified functions. It shall provide a command prioritization scheme to allow functional override of control functions. Refer also to Section 23 09 19 for other aspects of the controller's operating system.

E. Network Communications: Each controller shall include software/firmware that supports the networking of CUs on a common communications trunk that forms the respective LAN. Network support shall include the following:

1. Building Controller/Primary LAN shall be a high-speed network designed and optimized for control system communication. If a Primary LAN communications trunk is severed, BCs shall reconfigure into two separate LANs and continue operations without interruption or Operator intervention.
2. Controller communication software shall include error detection, correction, and re-transmission to ensure data integrity.
3. Operator/System communication software shall facilitate communications between other BCs, all subordinate AACs/ASCs, Gateways and LAN Interface Devices or Operator Workstations. Software shall allow point interrogation, adjustment, addition/deletion, and programming while the controller is on line and functioning without disruption to unaffected points. The software architecture shall allow networked controllers to share selected physical and virtual point information throughout the entire system.

F. Diagnostic Software: Controller software shall include diagnostic software that checks memory and communications and reports any malfunctions

G. Alarm/Messaging Software: Controller software shall support alarm/message processing and buffering software as specified below.

H. Application Programs: CUs shall support and execute application programs specified:

I. Updating/Storing Application Data: Site-specific programming residing in volatile memory shall be uploadable/downloadable from an OWS or CSS using BACnet services connected locally, to the Primary LAN, to the Local Supervisory LAN and remotely via modem and telephone lines as applicable but all must be available. Initiation of an upload or download shall include all of the following methods; Manually, Scheduled, and Automatically upon detection of a loss or change.

J. Power Loss and Restart: System software shall provide for orderly shutdown upon loss of power. Volatile memory shall be retained. Outputs shall go to programmed fail position, which as a default

shall be set to their position in unoccupied mode. Equipment restart shall be automatic upon power restoration and shall include a user definable time delay on each piece of equipment to stagger the restart. Loss of power shall be alarmed at operator interface indicating date and time.

K. Time Synchronization: Operators shall be able to set the time and date in any device on the network that supports time-of-day functionality. The operator shall be able to select to set the time and date for an individual device, devices on a single network, or all devices simultaneously. Automatic time synchronization shall be provided using BACnet services.

L. Anti-dithering. In order to improve the life expectancy of modulating electronic actuators, software shall limit the number of re-positions. This can be accomplished by providing anti-dithering software, a small deadband for fully proportioning actuators, and by ensuring that floating actuators do not receive control pulses of excessively short duration.

2.2 GRAPHICAL USER INTERFACE SOFTWARE

A. A web browser installed on each OWS, POT, and server (see Section 23 09 16) shall serve as the graphical user interface to the EMCS. Communication between the web server GUI and EMCS server shall be encrypted using 128-bit encryption technology within Secure Socket Layers. Communication protocol shall be Hyper-Text Transfer Protocol.

B. The GUI shall provide a comprehensive user interface. Using a collection of web pages, it shall be constructed to “feel” like a single application, and provide a complete and intuitive mouse/menu driven operator interface. It shall be possible to navigate through the system using a web browser to accomplish all features specified in this section.

C. The GUI shall (as a minimum) provide a Navigation Pane for navigation, and a Action Pane for display of animated graphics, schedules, alarms/events, live graphic programs, active graphic setpoint controls, configuration menus for operator access, reports, and reporting actions for events.

D. Login. Upon launching the web browser and selecting the appropriate domain name or IP address, the operator shall be presented with a login page that will require a login name and password. Navigation in the system shall be dependent on the operator’s role privileges, and geographic area of responsibility. See Security Access below.

E. Navigation Pane

1. The Navigation Pane shall comprise a Navigation Tree which defines a geographic hierarchy of the EMCS system. Navigation through the GUI shall be accomplished by clicking on appropriate level of a navigation tree (consisting of expandable and collapsible tree control like Microsoft’s Explorer program), and/or by selecting dynamic links to other system graphics. Both the navigation tree and action pane defined below shall be displayed simultaneously, enabling the operator to select a specific system or equipment, and view the corresponding graphic. The navigation tree shall as a minimum provide the following views:

    a. Geographic View shall display a logical geographic hierarchy of the system including: cities, sites, buildings, building systems, floors, equipment and BACnet objects.
    b. Network View shall display the hierarchy of the actual BACnet IP Intranet network. This can include: Systems, Site, Networks, Routers, Half-Routers, Devices, Equipment and all the BACnet Objects in a device.
    c. Groups View shall display Scheduled Groups and custom reports.
    d. Configuration View shall display all the configuration categories (Operators, Schedule, Event, Reporting and Roles).

2. Alternative interface structures will also be accepted if they provide similar ease of navigation through the system hierarchy.

F. Action Pane. The Action Pane shall provide several functional views for each HVAC or mechanical/electrical subsystem specified. A functional view shall be accessed by clicking on the corresponding button:

1. Graphics: Using animated gifs or other graphical format suitable for display in a web browser, graphics shall include aerial building/campus views, color building floor-plans, equipment drawings, active graphic setpoint controls, web content, and other valid HTML elements. The data on each graphic page shall automatically refresh as frequently as 6 updates per minute.
2. Properties: Shall include graphic controls and text for the following: Locking or overriding BACnet objects, demand strategies, and any other valid data required for setup. Changes made to the properties pages shall require the operator to depress a 'accept/cancel' button.
3. Schedules: Shall be used to create, modify/edit and view schedules based on the systems geographical hierarchy and in compliance with paragraph 2.2H.
4. Events: Shall be used to view alarm event information geographically (using the navigation tree), acknowledge events, sort events by category, actions and verify reporting actions.
5. Trends: Shall be used to display associated trend and historical data, modify colors, date range, axis and scaling
6. Logic - Live Graphic Programs: Shall be used to display a 'live' graphic programs of the control algorithm for the mechanical/electrical system selected in the navigation tree.

G. Graphics

1. The GUI shall make extensive use of color in the graphic pane to communicate information related to setpoints and comfort. Animated graphics and active setpoint graphic controls shall be used to enhance usability.
2. Graphics tools used to create Web Browser graphics shall be non-proprietary and provided and installed on each OWS.
3. Graphical display shall be 1280 x 1024 pixels or denser, 256 color minimum.
4. Links:

    a. Graphics shall include hyperlinks which when selected (i.e. clicked on with mouse) launch applications, initiate other graphics etc.
    b. Screen Penetration: Links shall be provided to allow user to navigate graphics logically without having to navigate back to the home graphic. See additional discussion in Paragraph 3.5.
    c. Information Links:

        (1) On each MEP system and subsystem graphic, provide links to display in a new window the information listed below.

            a) English-language control sequence associated with the system. See Section 23 09 29.
            b) O&M and submittal information for the devices on the graphic. See Section 23 09 00.

        (2) The display shall identify the target of the link by file name/address.
        (3) Information shall be displayed in electronic format that is text searchable.
        (4) Window shall include software tools so that text, model numbers, or point names may be found. Source documents shall be read-only (not be editable) with this software, however.

5. Point Override Feature:

    a. Every real output or virtual point displayed on a graphic shall be capable of being overridden by the user (subject to security level access) by mouse point-and-click from the graphic without having to open another program or view.
    b. When the point is selected to be commanded:

        (1) Dialog box opens to allow user to override the point (place in “operator mode”) or release the point (“automatic mode”). Operator mode will override automatic control of the point from normal control programs.
        (2) Dialog box shall have buttons (for digital points) or a text box and/or slide bar (for analog points) to allow user to set the point’s value when in operator mode. These are grayed out when in automatic mode.
        (3) When dialog box is closed, mode and value are sent to controller.
        (4) Graphic is updated upon next upload scan of the actual point value.

    c. A list of points that are currently in an operator mode shall be available through menu selection.

6. Point override status (if a digital point is overridden by the supervised manual override per Section 23 09 19 or if a point is in operator mode per 2.2G.5) shall be clearly displayed for each point, e.g. by changing color or flag.
7. The color of symbols representing equipment shall change color or become animated based on status of binary point to graphically represent on/off status.
8. On floor plan displays of spaces, temperature shall be graphically displayed by coloring the zone area in accordance with or similar to the following:

    a. Red: space temperature above cooling setpoint by 2°F (adj.) or more. This condition can be programmed to generate an alarm.
    b. Yellow: space temperature between cooling setpoint and 2°F (adj.) above setpoint.
    c. Green: space temperature between cooling and heating setpoints and space is in occupied mode.
    d. Gray: space temperature between cooling and heating setpoints and space is in unoccupied mode.
    e. Light blue: space temperature between heating setpoint and 2°F (adj.) below setpoint.
    f. Dark blue: space temperature below heating setpoint by 2°F (adj.) or more. This condition can be programmed to generate an alarm.

9. On floor plan displays of spaces, lighting shall be graphically displayed by coloring the lighting zone area in accordance with or similar to the following:

    a. Yellow: lights on by timed override.
    b. Red: lights on by manual override in lighting panel.
    c. Green: lights on by schedule.
    d. Gray: lights off.

10. Floor plans shall include final room names and room numbers as confirmed by the Using Agency. Room names and room numbers included in Construction Documents are not necessarily the final room names and room numbers. Division 23C Contractor shall be responsible for obtaining and confirming the final room names and room numbers from Using Agency. Changes to floor plan graphics resulting from wrong room names and room numbers shall be made at no additional charge to the Using Agency.

H. Graphics Development Package:

1. Graphic development and generation software shall be provided to allow the user to add, modify, or delete system graphic displays.
2. Provide capability to store graphic symbols in a symbol directory and incorporate these symbols into graphics.
3. Provide libraries of pre-engineered screens and symbols depicting standard air handling unit components (e.g. fans, cooling coils, filters, dampers, etc.), mechanical system components (e.g., pumps, chillers, cooling towers, boilers, etc.), complete mechanical subsystems (e.g. VAV reheat zone, etc.) and electrical symbols.
4. The Graphic Development Package shall use a mouse or similar pointing device to allow the user to perform the following:

    a. Define symbols
    b. Position items on graphic screens
    c. Attach physical or virtual points to a graphic
    d. Define background screens
    e. Define connecting lines and curves
    f. Locate, orient and size descriptive text
    g. Define and display colors for all elements
    h. Establish correlation between symbols or text and associated system points or other displays.
    i. Create hot spots or link triggers to other graphic displays or other functions in the software.

5. A single graphic file shall be used for common control applications (e.g. VAV box) so that any updates to the graphic may be done once and automatically applied to all applications. Displayed points shall be automatically populated based on “wild card” entry of point name in graphic definition.

I. Time and Schedules

1. Provide a time master that is installed and configured to synchronize the clocks of all BACnet devices supporting time synchronization. Synchronization shall be done using Coordinated Universal Time. All trend sample times shall be able to be synchronized. The frequency of time synchronization message transmission shall be selectable by the operator.
2. System shall automatically change time/date for Daylight Savings Time and leap years.
3. An operator (with password access) shall be able to define a Normal, Holiday or Override schedule for an individual piece of equipment or room, or choose to apply a hierarchical schedule to the entire system, site or floor “isolation” area. For example, Independence Day ‘Holiday’ for every level in the system would be created by clicking at the top of the geographic hierarchy defined in the Navigation Tree. No further operator intervention would be required and every control module in the system with would be automatically downloaded with the ‘Independence Day’ Holiday.
4. All schedules that affect the system/area/equipment highlighted in the Navigation Tree shall be shown in a summary schedule table and graph.
5. Schedules shall comply with the BACnet standard, (Schedule Object, Calendar Object, Weekly Schedule property and Exception Schedule property) and shall allow events to be scheduled based on:

    a. Types of schedule shall be Normal, Holiday or Override
    b. A specific date,
    c. A range of dates,
    d. Any combination of Month of Year (1-12, any), Week of Month (1-5, last, any), Day of Week (M-Sun, Any)
    e. Wildcard (example, allow combinations like second Tuesday of every month).

6. Schedule Categories: The system shall allow operators to define and edit scheduling categories (different types of “things” to be scheduled; for example, lighting, HVAC occupancy, etc.). The categories shall include: name, description, icon (to display in the hierarchy tree when icon option is selected) and type of value to be scheduled.
7. Schedule Groups: In addition to hierarchical scheduling, operators shall be able to define functional Schedule Groups, comprised of an arbitrary group of areas/rooms/equipment scattered throughout the facility and site. For example, the operator shall be able to define an ‘individual tenant’ group – who may occupy different areas within a building or buildings. Schedules applied to the ‘tenant group’ shall automatically be downloaded to control modules affecting spaces occupied by the ‘tenant group’
8. Partial Day Exceptions: Schedule events shall be able to accommodate a time range specified by the operator (example: board meeting from 6 pm to 9 pm overrides Normal schedule for conference room).
9. Schedule Summary Graph: The schedule summary graph shall clearly show Normal versus Holiday versus Override Schedules, and the net operating schedule that results from all contributing schedules. Note: In case of priority conflict between schedules at the different geographic hierarchy, the schedule for the more detailed geographic level shall apply.
10. Schedule Distribution: For reliability and performance, instead of maintaining a single schedule in a field device that writes over the network to notify other devices when a scheduled event occurs, field devices will only keep their part of the schedule locally. The EMCS server software shall determine which nodes a hierarchical schedule applies to and will create/modify the necessary schedule objects in each field device as necessary.

J. Events and Alarms

1. Events and alarms associated with a specific system, area, or equipment selected in the Navigation Tree, shall be displayed in the Action Pane by selecting an ‘Events’ view.
2. Events View: Each event shall display an Event Category (using a different icon for each event category), date/time of occurrence, current status, and event report. An operator shall be able to sort events, edit event templates and categories, acknowledge or force a return to normal in the Events View as specified in this section.
3. Event Categories (Alarm Levels): The operator shall be able to create, edit or delete event categories (alarm level). An icon shall be associated with each Event category, enabling the operator to easily sort through multiple events displayed. Alarm levels shall be initially configured by the Contractor as follows:

    a. Level 1: Critical/life safety
    b. Level 2: Significant equipment failure
    c. Level 3: Non-critical equipment failure/operation
    d. Level 4: Energy conservation monitor
    e. Level 5: Maintenance indication, notification.

4. BACnet Event Templates: BACnet Event template shall define different types of alarms and their associated properties. As a minimum, properties shall include a reference name, verbose description, severity of event, acknowledgement requirements, high/low limit and out of range information.
5. Event Areas (Actions): Each Event Categories (Alarm Level) shall be configured to specific Event Reporting Actions. For example, it shall be possible for an operator to assign all HVAC Maintenance events on the 1st floor of a building to email the technician responsible for maintenance. The Navigation Tree shall be used to setup Event Areas in the Graphic Pane. For initial setup, contractor shall configure events as follows:

    a. Levels 1 and 2: Print to alarm printer and page two engineers.
    b. Level 3: Print to alarm printer and email engineer responsible for building/system
    c. Levels 4 and 5: Email engineer responsible for building/system

6. Event Reporting Actions: Event Reporting Actions specified shall be automatically launched (under certain conditions) after an event is received by the EMCS server software. Operators shall be able to define these Reporting Actions using the Navigation Tree and Graphic Pane through the GUI. Reporting Actions shall be as follows:

    a. GUI dialog box: Provide visual and optional audible alarm indication. The alarm dialog box shall always become the top dialog box upon receipt of an alarm irrespective of the foreground application.
    b. Print: Alarm/Event information shall be printed to the any network accessible printer.
    c. Email: Alarm/Event information shall be via email to a POP3 address on the Using Agency's intranet or through this intranet to the internet.
    d. Page: Alarm/Event information shall be sent to alphanumeric pager either via modem or using email to internet alphanumeric paging services.
    e. File Write: The ASCII File write reporting action shall enable the operator to append operator defined alarm information to any alarm through a text file. The alarm information that is written to the file shall be completely definable by the operator. The operator may enter text or attach other data point information (such as AHU discharge temperature and fan condition upon a high room temperature alarm).
    f. Write Property: The write property reporting action updates a property value in a hardware module.
    g. Run External Program: The Run External Program reporting action launches specified program in response to an event.

7. Event Time/Date Stamp: All events shall be generated at the DDC control module level and comprise the Time/Date Stamp using the standalone control module time and date.
8. Event Configuration: Operators shall be able to define the type of events generated per BACnet object. A 'network' view of the Navigation Tree shall expose all BACnet objects and their respective Event Configuration. Configuration shall include assignment of event, alarm, type of Acknowledgement and notification for return to normal or fault status.
9. Event Summary Counter: The view of events in the Graphic Pane shall provide a numeric counter, indicating how many events are active (in alarm), require acknowledgement, and total number of events in the EMCS Server database.
10. Event Auto-Deletion: Events that are acknowledged and closed, shall be auto-deleted from the database and archived to a text file after an operator defined period. The file shall be stored in file on the CSS with no limit to quantity or age of alarms, other than limitations of hard disk. The file can be archived to tape and deleted by operator to clear disk space.
11. Data Format. The system shall allow for external systems to access the event instance data. Event data shall be stored and queried in the database in a relational manner. At a minimum, the fields to be stored in the database are:

    a. Event Source
    b. Event Generation Time
    c. Acknowledge Required Flag
    d. Delivery Priority
    e. BACnet Event Type
    f. Event Message Text
    g. BACnet Event Parameter
    h. Classification of Event
    i. Event Acknowledgement Time
    j. Return to Normal Time
    k. Operator Comments
    l. Who Acknowledged the Event

12. Event Simulator: The GUI user shall provide an Event Simulator to test assigned Reporting

Actions. The operator shall have the option of using current time or scheduling a specific time to generate the Event. Utilizing the Navigation Tree and drop-down menus in the Graphic Pane, the operator shall be able to select the Event Type, Status, Notification, Priority, Message, and whether acknowledgement is required.

K. Trends

1. Trending and trend analysis capabilities are considered critical to system performance. The system shall be designed to upload and record large amounts of point data without causing network bottlenecks or affecting proper system operation. A separate server (Historical Trend Server) shall be provided (see Section 23 09 16) in order to reduce network traffic to and disk activity on the CSS. The system as a whole shall be designed to comply with the trending capability test defined in Section 23 09 33.
2. Every point, both real and virtual, shall be available for data trending.
3. Trending software shall be capable of recording point values and time on a user specified regular time step and on a change-of-value (COV) basis (data is recorded when point changes by a specified amount for analog points or by changes of state for binary points), at the user's option. Sampling intervals shall be as small as one second. Each trended point shall have the ability to be trended at a different sampling interval.
4. Trend data shall be sampled and stored in control panel memory (see Section 23 09 19). If historical trending is enabled for the BACnet object, trend data shall be uploaded from control panels to the THS on a user-defined interval, manual command, or automatically when the trend buffer becomes full.. There shall be no limit to the amount of trend data stored at the THS other than hard disk limitations.
5. Trends shall conform to the BACnet Trend Log Object specification. Trends shall both be displayed and user configurable through the GUI. Trend logs may comprise analog, digital or calculated points simultaneously. A trend log's properties shall be editable using the Navigation Tree and Graphic Pane.
6. Viewing Trends:

    a. Trend data shall be displayed graphically by the GUI. This shall be a capability internal to the workstation software and not a capability resulting from download of trend data on a third-party spreadsheet program unless such transfer is automatic and transparent to the operation and the third-party software is included with the workstation software package.
    b. The software shall be capable of dynamically graphing the trend logged object data by creating two-axis (x, y) graphs that simultaneously display values relative to time for at least eight objects in different colors, even if objects have been trended at different time intervals. Where trended values are COV, software shall automatically fill the trend samples between COV entries. A graph legend shall identify each variable plotted.
    c. Multiple scales shall be possible, one for each object, with range set automatically by the software but capable of being manually adjusted by the operator.
    d. Trend format, displayed points, etc. shall be capable of being saved as a template for future trend displays.
    e. Trends shall be able to dynamically update at operator-defined intervals, including on a 1 second interval for loop tuning.
    f. It shall be possible to zoom-in on a particular section of a trend for more detailed examination and 'pan through' historical data by simply scrolling the mouse.
    g. It shall be possible to pick (or float mouse over) any sample on a trend and have the numerical value displayed.
    h. The operator shall have the ability to pan through a historical trend and copy the data viewed to the clipboard using standard Windows keystrokes.

7. Trend Data Storage

a. The database shall allow applications to access the data while the database is running. The database shall not require shutting down in order to provide read-write access to the data. Data shall be able to be read from the database without interrupting the continuous storage of trend data being carried by the EMCS.
b. Provide a single licensed copy of Microsoft SQL Server and install on the THS.
c. Data shall be accessible to off-site SQL compliant database software through the Using Agency intranet and/or internet.

L. Security Access

1. Security access from the GUI to EMCS servers shall require a Login Name and Password.
2. Access to different areas of the EMCS shall be defined in terms of roles and geographic area of responsibility as specified:
3. Roles shall reflect the actual roles of different types of operators. Roles shall be defined in terms of View, Edit and Function Privileges.

    a. View Privileges: Navigation, Network, and Configuration Trees, Operators, Roles and Privileges, Alarm/Event Template and Reporting Action.
    b. Edit Privileges: Setpoint, Tuning and Logic, Manual Override, and Point Assignment Parameters.
    c. Function Privileges: Alarm/Event Acknowledgement, Control Module Configuration, Memory Download, and Upload, Schedules, Schedule Groups, Manual Commands, Print, and Alarm/Event Maintenance.

4. Roles shall be geographically assigned using a similar expandable/collapsible navigation tree. For example, it shall be possible to assign two HVAC Technicians with similar competencies (and the same operator defined HVAC Role) to different areas of the system.
5. Each operator shall automatically be logged off of the system if no keyboard or mouse activity is detected for an adjustable period of time. This auto logoff time shall be set individually per operator.
6. Provide an audit trail of actions taken by any user, including the user name and time. Store in secure file in database format on the CSS. Provide software to view and print audit trail.

M. Report Software

1. Provide software to create standard and custom reports of point status, alarms, etc. Report format, displayed points, time period (daily, weekly, monthly, or annual), etc. shall be capable of being saved as a template for future reports. Reports shall be time and date stamped and shall contain a report title editable by the user.
2. Reports shall be capable of being sent to a printer or export to Word or ASCII format to a file, and shall be capable of being generated automatically based on date and time of day.
3. Standard reports. Prepare the following standard reports for each building and the Using Agency as a whole, accessible automatically without requiring definition by user:

    a. Tenant after-hour usage. System must be capable of monitoring tenant override requests and generating a monthly report showing the daily total time in hours that each tenant has requested after-hours HVAC services.
    b. Monthly and annual energy usage and cost. See Utility cost calculation in Section 23 09 29.
    c. Alarm events and status.
    d. Points in “hand” (operator override) via Workstation command (including name of operator who made the command) or via supervised HOA switch at output, including date and time.
    e. Position reset: Where zones or system valve or damper positions are used to reset supply air/water temperature or differential pressure setpoints:

(1) EMCS shall record the following on an hourly basis: the descriptors of the zones/systems that have dampers/valves at the highest cooling/heating position, i.e. the control point that is being used in the reset loop. The information shall be accumulated in a report format for periodic printing upon operator command.
(2) Configure a tabular report using real-time or trend data with the following column headings: ZONE [SYSTEM] DESCRIPTION, VALVE [DAMPER] POSITION (0 to 100%), LOOP OUTPUT %, [CHWST, CHWDP, SAT, etc.] SETPOINT. At the top of the table, list building number, floor or area description if applicable, air handling unit or HW/CHW pump system designation.

2.3 CONTROL PROGRAMMING SOFTWARE

A. Points

1. Provide templates customized for point type, to support input of individual point information using standard BACnet Objects, including long-name field
2. All real and virtual points shall be accessible to any control panel for use in any control sequences regardless of physical location.

B. Programming Language

1. All controllers must be fully user-programmable using a single programming language for all control devices. Use of “canned” (preprogrammed, burned-in) software is not acceptable.
2. The control programming language must allow virtually any control sequences to be written. Software shall be capable of the sequences specified in Section 23 09 29 without exception.
3. All custom programs shall be modifiable from Operator Workstations without having to “burn chips”. Software shall allow the user to modify and input control sequence software and to download to panels via the control network or modem.
4. The programming language shall support floating point arithmetic using the following operators and functions: +, -, /, x, square root, and x-to-the-y-power, natural log, log, trigonometric functions (sine, cosine, etc.), absolute value, minimum/maximum value from a list of values, and psychrometric parameters (wetbulb, dewpoint, and enthalpy) from temperature and relative humidity.
5. The programming language shall have predefined variables that represent time of day, day of the week, month of the year, and the date. Other predefined variables shall provide elapsed time in seconds, minutes, hours, and days. These elapsed time variables shall be able to be reset by the language so that interval timing functions can stopped and started within a program.
6. The system must be capable of supporting software (“virtual”) points to be used in control sequences and monitored just as if they were real digital or analog points.
7. Control programming shall employ the BACnet protocols for Standard Command Priorities.
8. A PID (proportional-integral-derivative) algorithm with adjustable gains and anti-windup shall be included as an integral part (subroutine) of the programming language, not requiring special programming or hardware.
9. The programming language shall be graphical. BASIC-like or other line- or block-type programming languages are not acceptable. With the graphical programming language, a sequence of operations shall be created by drag-and-drop assembling on screen of graphic blocks that represent each of the commands or functions necessary to complete a control sequence. Blocks represent common logical control devices such as relays, switches, high signal selectors, PID loops, optimum start, etc. Blocks are then interconnected on screen using graphic "wires," each forming a logical connection. Once assembled, each logical grouping of graphic blocks and their interconnecting wires then forms a graphic function block which may be used to control any piece of equipment with a similar point configuration

and sequence of operation.

10. The graphic programming software shall support a 'live' mode, where all input/output data, calculated data, and setpoints shall be displayed in a 'live' real-time mode. For each piece of HVAC equipment, the entire graphic program shall be displayed through the GUI. The operator must have the ability to scroll through the entire 'live' graphic program as necessary.

C. Debugging software:

1. Provide a search capability that will search all control sequences for a given point name to determine all sequences that use or control the point.
2. The control programs shall be capable of being tested on-line or off-line (prior to installation in field panels). The program and results of programming tests shall be displayed graphically using graphical programming language with parameter values displayed in appropriate locations. Simulation capabilities shall include step-by-step, accelerated time, and operator defined simulation criteria like outside weather, demand, and communication status.

2.4 OCCUPANT INTERFACE SOFTWARE

A. The intent of this software is to allow occupants to use web browsers to access the EMCS through the Occupant Interface Server in Control Room. Capabilities shall include the following:

1. Override schedules for off-hour use of lighting and HVAC
2. View system status, such as any system-wide faults or other announcements
3. Change zone setpoints

B. Performance

1. Occupants will access the system using a web browser to an EMCS home page that will ask for user name and password. The system will be initially set up only to allow employees to have access. This may be expanded to students in the future.
2. User name will link the occupant to a location via an interface to the Using Agency's employee (and future student) database. For employees, the link will indicate department and classroom locations.
3. The user name link will allow access to the graphic of the floor plan of the employee's department and associated classrooms.
4. Through special hyperlinks, the user will be able to override schedules, change setpoints, etc. in the areas for which they are granted access.

C. Any number of occupants may have access to the system at any time.

D. Work shall include coordinating with the Using Agency's employee database system to define the fields necessary for this system to operate.

2.5 MISCELLANEOUS SOFTWARE:

A. Provide a context-sensitive, on-line help system to assist the operator in operating and editing the system. On-line help shall be available for all applications and shall provide relevant data for the application or object that help is being called from.

B. Provide software for viewing (but not editing) electronic versions of as-built shop drawings of:

1. Mechanical, electrical, and plumbing systems in AutoCAD Release 14 or 2000+ format.
2. EMCS drawings in format selected by contractor (see limitations in Section 23 09 00).

PART 3 - EXECUTION

3.1 SYSTEM CONFIGURATION

A. Contractor shall thoroughly and completely configure EMCS system software, supplemental software, network software etc. on CSS, POTs, and servers.

3.2 POINT STRUCTURING AND NAMING

A. The intent of this section is to require a consistent means of naming points across the Campus EMCS. Contractor shall configure the systems from the perspective of the Campus EMCS, not solely the local project. The following requirement establishes a standard for naming points and addressing Buildings, Networks, Devices, Instances, etc.

B. Point Summary Table

1. The term 'Point' includes all physical I/O points, virtual points, and all application program parameters.
2. With each schematic, Contractor shall provide a Point Summary Table listing:

    a. Building number and abbreviation
    b. System type
    c. Equipment type
    d. Point suffix
    e. Full point name (see Point Naming Convention paragraph)
    f. Point description
    g. Ethernet backbone network number,
    h. Network number
    i. Device ID
    j. Device MAC address
    k. Object ID (object type, instance number)
    l. Engineering units.
    m. Device make and model #. Include range of device if model number does not so identify.
    n. Device physical location description. Include floor and column line intersection to one decimal place (e.g. line 6.2 and line A.3).

3. Point Summary Table shall be provided in both hard copy and in a relational database electronic format (ODBC-compliant).
4. The EMCS Contractor shall coordinate with the Using Agency's representative and compile and submit a proposed Point Summary Table for review prior to any object programming or project startup.
5. The Point Summary Table shall be kept current throughout the duration of the project by the Contractor as the Master List of all points for the project. Project closeout documents shall include an up-to-date accurate Point Summary Table. The Contractor shall deliver to the Using Agency the final Point Summary Table prior to final acceptance of the system. The Point Summary Table shall be used as a reference and guide during the commissioning process.

C. Point Naming Convention

1. All point names shall adhere to the format as established below, unless otherwise agreed to

by the Using Agency. New categories and descriptors may be created with approval of the Using Agency.

2. Format:

   a. Building.Category.System.EquipmentTag.Component.Property.
   b. Example: 001LIB.HVAC.Heatplant.B-1.HWS.Temperature

Building	Category	System	Equipment Tag	Component	Property	Typical units
Building number	ELCT	Lighting Plug Generator MIsc	(from equipment schedules)	SWITCH PHOTO CB CWS CWR HWS HWR CHWS CHWR OA SA RA EA GAS FLUID	Command Status Light Power Voltage Current ValvePos DamperPos Temperature Humidity Pressure Flow Energy Speed Signal	On/off On/off Footcandles Watts Volts Amps %open %open °F %RH Psig, " H_2O Cfm, gpm Btu %, Hz Hz
	HVAC	Air handling Exhaust Heatplant Coolplant Misc				
	PLMB	Dom water Air Nat gas N2 O2 Irrigation Waste Misc				
	MISC	Weather				

D. Device Addressing Convention:

1. BACnet network numbers and Device Object IDs shall be unique throughout the network.
2. All assignment of network numbers and Device Object IDs shall be coordinated with the Using Agency.
3. Each Network number shall be unique throughout all facilities and shall be assigned in the following manner unless specified otherwise:

   BBBFF, where: BBB = 1-655 assigned to each building, FF = 00 for building backbone network, 1-35 indicating floors or separate systems in the building.

4. Each Device Object Identifier property shall be unique throughout the system and shall be assigned in the following manner unless specified otherwise:

   XXFFBBB, where: XX = number 0 to 40, FF = 00 for building backbone network, 1-35 indicating floors or separate systems in the building. BBB = 1-655 assigned to each building.

5. The EMCS Contractor shall coordinate with the Using Agency or a designated representative to ensure that no duplicate Device Object IDs occur.
6. Alternative Device ID schemes or cross project Device ID duplication if allowed shall be approved before project commencement by the Using Agency.

E. I/O Point Physical Description

1. Each point associated with a hardware device shall have its BACnet long-name point description field filled out with:

   a. The device manufacturer and model #. Include range of device if model number does not so identify.
   b. For space sensors (temperature, CO_2, etc.), include room number in which sensor is located.

3.3 POINT PARAMETERS

A. Provide the following minimum programming for each analog input:

1. Name
2. Address
3. Scanning frequency or COV threshold
4. Engineering units
5. Offset calibration and scaling factor for engineering units
6. High and low alarm values and alarm differentials for return to normal condition
7. High and low value reporting limits (reasonableness values), which shall prevent control logic from using shorted or open circuit values.
8. Default value to be used when the actual measured value is not reporting. This is required only for points that are transferred across the primary and/or secondary controlling networks and used in control programs residing in control units other than the one in which the point resides. Events causing the default value to be used shall include failure of the control unit in which the point resides, or failure of any network over which the point value is transferred.
9. Selectable averaging function that shall average the measured value over a user selected number of scans for reporting.

B. Provide the following minimum programming for each analog output:

1. Name
2. Address
3. Output updating frequency
4. Engineering units
5. Offset calibration and scaling factor for engineering units
6. Output Range
7. Default value to be used when the normal controlling value is not reporting.

C. Provide the following minimum programming for each digital input:

1. Name
2. Address
3. Engineering units (on/off, open/closed, freeze/normal, etc.)
4. Debounce time delay
5. Message and alarm reporting as specified
6. Reporting of each change of state, and memory storage of the time of the last change of state
7. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.

D. Provide the following minimum programming for each digital output:

1. Name
2. Address
3. Output updating frequency
4. Engineering units (on/off, open/closed, freeze/normal, etc.)
5. Direct or Reverse action selection
6. Minimum on-time
7. Minimum off-time
8. Status association with a DI and failure alarming (as applicable)
9. Reporting of each change of state, and memory storage of the time of the last change of state.
10. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.
11. Default value to be used when the normal controlling value is not reporting.

3.4 SITE-SPECIFIC APPLICATION PROGRAMMING

A. All site specific application programming shall be written in a manner that will ensure programming quality and uniformity among the various buildings. The EMCS Contractor will ensure:

1. Programs for all buildings are developed by one programmer, or a small group of programmers with rigid programming standards, to ensure a uniform style.
2. Programs for like functions are identical, to reduce debugging time and to ease maintainability.
3. Programs are thoroughly debugged before they are installed in the field.

B. Massage and tune application programming for a fully functioning system. It is the Contractor's responsibility to request clarification on sequences of operation that require such clarification.

C. All site-specific programming shall be fully documented and submitted for review and approval:

1. Prior to downloading into the panel (see Submittal Package 2 in Section 23 09 00.)
2. At the completion of functional performance testing, and
3. At the end of the warranty period (see Warranty Maintenance in Section 23 09 00).

D. All programming, graphics and data files must be maintained in a logical system of directories with self-explanatory file names. All files developed for the project will be the property of the Using Agency and shall remain on the workstations/servers at the completion of the project.

3.5 GRAPHIC SCREENS

A. All site specific graphics shall be developed in a manner that will ensure programming quality and uniformity among the various buildings.

B. Schematics of MEP systems.

1. Schematics shall be 2-D (or 3-D) and shall be based substantially on the schematics provided on design drawings.
2. All relevant I/O points and setpoints being controlled or monitored for each piece of equipment shall be displayed with the appropriate engineering units. Animation or color changes shall be used to indicate on/off status of mechanical components. Include appropriate engineering units for each displayed point value. Verbose names (English language descriptors) shall be included for each point on all graphics; this may be accomplished by the use of a pop-up window accessed by selecting the displayed point with

the mouse.

3. Animation or equipment graphic color changes shall be used to indicate on/off status of mechanical components.
4. Indicate all adjustable setpoints and setpoint high and low limits (for automatically reset setpoints), on the applicable system schematic graphic or, if space does not allow, on a supplemental linked-setpoint screen.

C. Displays shall show all points relevant to the operation of the system, including setpoints and setpoint limits for setpoints that are automatically reset.

D. The current value and point name of every I/O point and setpoint shall be shown on at least one graphic and in its appropriate physical location relative to building and mechanical systems.

E. Show weather conditions (local building outside air temperature ands humidity, wind speed, and wind direction) in the upper left hand corner of every graphic.

F. CAD Files: The contract document drawings will be made available to the Contractor in AutoCAD Release 14 or 2000+ format upon request for use in developing backgrounds for specified graphic screens, such as floor plans and schematics. However the Using Agency does not guarantee the suitability of these drawings for the Contractor’s purpose.

G. Provide graphics for the following as a minimum:

1. Campus homepage. Background shall be a campus map, approximately to scale. Include links to each building, central plant, domestic water pumping station, etc. Include real-time site utility data such as: building electrical demand, domestic cold water flow, and natural gas demand shown roughly on the map where the utilities connect to the site. Also include kW demand limit values and demand limit level.
2. Building homepage. Background shall be a bldg footprint, approximately to scale, oriented as in the campus homepage. Include links to each floor and mechanical room/roof, and to summary graphics described below. Include real-time building utility data such as: building electrical demand, chilled water demand (flow and Btu/h), hot water demand (flow and Btu/h), domestic cold water demand, steam demand (if applicable), and natural gas demand (if applicable) shown roughly on the building footprint where the utilities connect to the building.
3. Each occupied floor plan, to scale.

    a. HVAC. Floor plan graphics shall show heating and cooling zones throughout the buildings in a range of colors, which provide a visual display of temperature relative to their respective setpoints (see paragraph 2.2G.8). The colors shall be updated dynamically as a zone's actual comfort condition changes. In each zone, provide links to associated terminal equipment.
    b. Lighting. Floor plan graphics shall show lighting control zones throughout the buildings in a range of colors, which provide a visual display of temperature relative to their respective setpoints (see paragraph 2.2G.9). The colors shall be updated dynamically as a zone's actual lighting condition changes. In each zone, provide links to associated lighting panel screen to allow manual overrides.
    c. If multiple floor plans are necessary to show all areas, provide a graphic building key plan. Use elevation views and/or plan views as necessary to graphically indicate the location of all of the larger scale floor plans. Link graphic building key plan to larger scale partial floor plans. Provide links from each larger scale graphic floor plan screen to the building key plan and to each of the other graphic floor plan screens.

4. Each equipment floor/roof plan, to scale, with links to graphics of all DDC controlled/monitored equipment.

5. Each air handler and fan-coil. Provide link to associated HW and CHW pumping stations where applicable.
6. Each zone terminal. Provide link to associated air handling unit where applicable and to floor plan where terminal is located..
7. Each pumping building station. Provide link to central plant for heating and cooling systems.
8. Potable water pumping plant and irrigation meter.
9. Lighting panels. Indicate status of each relay and provide links to allow overrides.
10. Electrical power monitoring system.

    a. Site: Show site single line diagram up to each building ATS, in order to illustrate the 12 KV power distribution and connection of each building to one of the two site circuits. The power flow would change on the diagram (by changing line color and/or width) to show which power line is active into each building as the ATS position is changed. Show ATS status at each building and a link to each building's electrical system graphic.
    b. For each building: Show a schematic of the electrical system based on one-line diagrams. Show status and power of each switch, breaker, meter, etc. and override buttons for overriding switch positions.

11. Central plant equipment including chilled water system, cooling tower system, hot water system, steam system, generators, etc. The flow path shall change on the diagram (by changing piping line color and/or width) to show which piping has active flow into each boiler, chiller, tower, etc. as valve positions change.
12. Weather station. Show actual, daily, month-to-date, year-to-date, and historical high and low peaks and average temperature, humidity, wind speed, wind direction (average only), and solar radiation.
13. Summary graphics. Provide a single text-based page (or as few as possible) for each of the following summary screens showing key variables listed in columns for all listed equipment:

    a. For each building:

        (1) Air handling units: operating mode, on/off status, supply air temperature, supply air temperature setpoint, fan speed, duct static pressure, duct static pressure setpoint, outdoor air damper position, coil valve positions
        (2) Zone terminal units: operating mode, airflow rate, zone temperature, zone temperature setpoint, damper position, supply air temperature (reheat boxes), supply air temperature setpoint (reheat boxes), fan status (fan-powered boxes), fume hood status and exhaust airflow rate (laboratory).
        (3) Electrical meters and switches: Volts, current, kW, switch positions.

    b. For campus:

        (1) Building bridge connections (chilled and hot water): building pump on/off status, pump speed, supply water temperature before and after bridge, return water temperature, differential pressure across bridge, strainer differential pressure, primary system valve position, flow rate
        (2) Utility summary for each building: building electrical demand, chilled water demand (flow and Btu/h), hot water demand (flow and Btu/h), domestic cold water demand, steam demand (if applicable), and natural gas demand (if applicable).

14. All other DDC controlled/monitored equipment.

H. Alarms: Each programmed alarm shall appear on at least one graphic screen. In general, alarms shall be displayed on the graphic system schematic screen for the system that the alarm is

associated with (for example, chiller alarm shall be shown on graphic cooling system schematic screen). For all graphic screens, display analog values that are in a 'high alarm' condition in a red color, 'low alarm' condition in a blue color. Indicate digital values that are in alarm condition in a red color.

3.6 POT SOFTWARE

A. Direct Panel Access:

1. One of the POTs shall be configured to access BCs and AACs by directly connecting to these panels without having to connect to the CSS via the network. The purpose of this requirement is to provide access to building EMCS panels in case the Supervisory LAN is down.
2. At the end of commissioning and then again at the end of the warranty period, fully synchronize the database on this POT with that on the CSS.

B. Temporary Interface prior to Acceptance

1. Point database and control programming shall not be installed on and merged with that on the CSS until the system is fully commissioned and accepted by the Using Agency. During this phase, the Contractor shall provide a temporary POT configured with proper software for this purpose, connected to the EMCS locally at the building.
2. Once the EMCS has been accepted by the Using Agency, merge the database and control programming with existing systems on the CSS.

C. TAB Coordination:

1. Software shall be provided free of charge on at least a temporary basis to the TAB contractor to allow them to calibrate terminal box airflow controls and other work specified under Section 23 05 93 Testing, Adjusting, and Balancing.
2. Software may be provided for installation on POT provided by TAB contractor or Contractor shall loan a POT or hand held device with software installed to the TAB contractor for the duration of TAB work.
3. Provide sufficient training to the TAB contractor to allow them to use the software for balancing and airflow calibration purposes. Contractor shall include a single training session; additional training due to changes in TAB personnel shall be paid for by the TAB contractor.

END OF SECTION 23 09 26

SECTION 23 09 29 – EMCS POINTS AND SEQUENCE OF OPERATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. This Section defines:

1. Real I/O points connected to the EMCS.
2. Sequence of operation of all controlled systems.

1.3 RELATED WORK AND REQUIREMENTS

A. Section 23 09 90 Energy Management and Control System (EMCS) − General

B. Section 23 09 13 EMCS Basic Materials and Devices

C. Section 23 09 16 EMCS Operator Interfaces

D. Section 23 09 19 EMCS Field Panels

E. Section 23 09 23 EMCS Communication Devices

F. Section 23 09 26 EMCS Software and Programming

G. Section 23 05 93 Testing, Adjusting, and Balancing

PART 2 - PRODUCTS

2.1 CONTROL POINTS

A. Table Column Definitions

1. Point description
2. Type (number in point schedule after each type refers to tag on schematics)

    a. AO: analog output
    b. AI: analog input
    c. DO: digital or binary output
    d. DI: digital or binary input

3. Device description

4. Trend Logging

    a. Commissioning. Where listed, point is to be trended at the basis listed for commissioning and performance verification purposes. Trend may be deactivated after acceptance.
    b. Continuous. Where listed, point is to be trended at the basis listed continuously, initiated after system acceptance, for the purpose of future diagnostics.
    c. Trend Basis:

        1) Where range of engineering units is listed, trend on a change of value (COV) basis (i.e. record time stamp and value when point value changes by engineering unit listed)
        2) Where time interval is listed, trend on a time basis (i.e. record time stamp and value at interval listed). All points relating to a specific piece of equipment shall be trended at the same initiation time of day so data can be compared in text format.

5. Calibration

    a. F = factory calibration only is required (no field calibration)
    b. HH = field calibrate with handheld device. See Calibration in Section 23 09 33.
    c. DB = field calibrate with a drywell bath. See Calibration in Section 23 09 33.

B. Note that points lists below are for <u>each</u> system of like kind. Refer to drawings for quantity of each.

C. Points mapped through gateways and network interfaces

1. Variable speed drives (typical of VFD driven fans and pumps): The following points shall be mapped over from the VFD network card as a minimum for each pump and fan that has a variable speed drive. (Note VFD start/stop and speed are hardware points as indicated in points list below and shall not be mapped through the gateway.)

Description	Type	Device	Trend Logging		Calibration
			Comm-issionng	Contin-uous	
Fault reset	DO	Through network	COV	COV	–
On/off status	DI	Through network	COV	COV	–
Fault (Critical Alarm)	DI	Through network	COV	COV	–
Minor Alarm	DI	Through network	COV	COV	-
Fault Text	DI	Through network (convert code to plain English text)	COV	COV	-
Alarm Text	DI	Through network (convert code to plain English text)	COV	COV	-
Keypad in hand/auto	DI	Through network	COV	COV	-
Minimum frequency setpoint	AO	Through network	±5%	±5%	-
Maximum frequency setpoint	AO	Through network	±5%	±5%	-
Acceleration rate	AO	Through network	±5%	±5%	-
Deceleration rate	AO	Through network	±5%	±5%	-
Actual frequency	AI	Through network	1 min	15 min	-
AC output voltage	AI	Through network	±10%	±10%	-

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issionng	Contin-uous	
Current	AI	Through network	15 min	60 min	F
VFD temperature	AI	Through network	60 min	60 min	F
Power, kW	AI	Through network	1 min	15 min	F
Energy, MWh	AI	Through network	15 min	60 min	-
DC Bus Voltage	AI	Through network	±10%	±10%	F

2. Emergency Generator Monitoring

   a. See electrical drawings and specifications for gateway connection points and the number of points that must be mapped over.

3. Electrical System Monitoring

   a. See electrical drawings and specifications for location of gateway connection points and the number of points that must be mapped over.
   b. The following table lists the trend logging requirements for each point mapped from the electrical system monitoring gateways.

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issionng	Contin-uous	
Real kW	AI	Through network	15 min	60 min	–
Consumption kWh	AI	Through network	15 min	60 min	–
Volts (each phase)	AI	Through network	±10%	±10%	–
Power Factor	AI	Through network	±10%	±10%	–
Amps (each phase)	AI	Through network	-	-	-

D. Hard-wired Points

1 VAV AHU (in addition to points mapped over from VFDs)

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Supply Fan Start/Stop	DO	Connect to VFD “Run”	COV	60 min	–
Relief Fan Start/Stop	DO	Connect to VFD “Run”	COV	60 min	
Relief Bypass Damper	DO	Two-Position Actuator	COV	-	-
OA Bypass Damper	DO	Two-Position Actuator	COV	-	-
Relief Fan Damper	DO	Two-Position Actuator	COV	-	-
Energy Wheel Start/Stop	DO	Dry Contact to 120V or 24V control circuit	COV	COV	
Energy Wheel Status	DI	CS-1	COV	COV	-
Water Sensor	DI	WS-1	COV	COV	-
OA Damper	AO	Modulating Actuator	1 min	60 min	-

Return Air Damper	AO	Modulating Actuator	1 min	60 min	-
HW Valve Signal	AO	Modulating 2-way valve	1 min	60 min	-
CHW Valve Signal	AO	Modulating 2-way valve	1 min	60 min	-
Supply Fan Speed	AO	Connect to VFD “Speed”	1 min	60 min	-
Relief Fan Speed	AO	Connect to VFD “Speed”	1 min	60 min	
Filter DP	AI	DPT-3A, 0 to 1”	1 min	60 min	-

OA Temp	AI	AFMS-1	1 min	60 min	
Relief Air Lvg Temp	AI	TS-1B	1 min	60 min	-
RA Temp	AI	TS-1A	1 min	60 min	-
SA Temp	AI	TS-1A	1 min	60 min	-
OA Temp	AI	TS-1B	1 min	60 min	-
Mixed Air Temp	AI	TS-1B	1 min	60 min	-
HW Lvg Air Temp	AI	TS-1B	1 min	60 min	-
Duct Static	AI	DPT-3A, 0 to 2 inches	1 min	60 min	-
Building Static	AI	DPT-4A, -0.5 to 0.5 inches	1 min	60 min	-

2 Fan Coil Units

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Supply Fan Start/Stop	DO	Dry contact to ECM or Dry contact to 120V starter control circuit (coordinate with final equipment submittal)	COV	COV	–
Local Override	DI	TS-3C	COV	COV	–
CHW Valve Signal	AO	Modulating 2-way valve	1 min	60 min	–
HW Valve Signal	AO	Modulating 2-way valve	1 min	60 min	–
Fan Speed Status	AI/DI	From ECM or CS-1 (coordinate with final equipment submittal)	1 min	60 min	–
Supply air temperature	AI	TS-1A	1 min	60 min	–
Zone Temperature Setpoint Adjustment	AI	TS-3C	15 min	60 min	–
Zone Temperature	AI	TS-3C	1 min	60 min	–

3 VAV Box with reheat

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
VAV Box Damper Positions	AO (or two DOs and an AI)	Modulating (or floating with position feedback) actuator	1 min	60 min	–
HW valve signal	AO	Modulating 2-way valve	1 min	60 min	
Local Override	DI	TS-3C	COV	COV	

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Occupancy Sensor	DI	OCC (By DIV 26, where indicated on Drawings)	COV	COV	-
Supply Airflow	AI	DPT-5 connected to box manufacturer supplied flow ring or cross	1 min	60 min	-
Supply air temperature	AI	TS-1A	1 min	60 min	-
Zone Temperature Setpoint Adjustment	AI	TS-3C	15 min	60 min	
Zone Temperature	AI	TS-3C	1 min	60 min	-
Zone CO2 Concentration	AI	CO2-1 (where indicated on Drawings)	1 min	60 min	-
Zone Humidity	AI	HS-1 (where indicated on Drawings)	1 min	60 min	-

4 Exhaust Fans – EMCS time-of-day controlled (includes fan controlled by motion detector)

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Exhaust Fan Start/Stop	DO	Dry Contact to 120V or 24V control circuit	COV	COV	–
Exhaust Fan Status	DI	CS-1	COV	COV	

5 Exhaust Fans – temperature controlled

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Exhaust Fan Start/Stop	DO	Dry Contact to 120V or 24V control circuit	COV	COV	–
Exhaust Fan Status	DI	CS-1	COV	COV	-
Zone Temperature	AI	TS-3A	1 min	60 min	-

6 Exhaust Fans – Crawlspace ventilation fan

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Exhaust Fan Start/Stop	DO	Dry Contact to 120V or 24V control circuit	COV	COV	–

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Exhaust Fan Status	DI	CS-1	COV	COV	-
Zone Humidity	AI	HS-1	1 min	60 min	-

7 Hot Water System (in addition to points mapped over from VFDs)

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
HWP Start Stop	DO	Connect to VFD “Run”	COV	COV	–
HWP Speed	AO	Connect to VFD “Speed”	1 min	60 min	-
HW Valve	AO	Modulating 2-way valve	1 min	60 min	-
HWS Temp (Bldg. Side)	AI	TS-2C	1 min	60 min	-
HWR Temp (Bldg. Side)	AI	TS-2C	1 min	60 min	-
HWS Temp (Loop Side)	AI	TS-2C	1 min	60 min	-
HWR Temp (Loop Side)	AI	TS-2C	1 min	60 min	-
HW Flow (Bldg. Side)	AI	FM-1	1 min	60 min	F
HW Flow (Loop Side)	AI	FM-1	1 min	60 min	F
HW DP (Bldg. Side)	AI	DPT-1, 0 to 15 psi	1 min	60 min	-
HW DP (Loop Side)	AI	DPT-1, 0 to 15 psi	1 min	60 min	-
HW Loop Pressure	AI	P-1, 0 to 100 psi	1 min	60 min	-

8 Chilled Water System (in addition to points mapped over from VFDs)

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
CWP Start Stop	DO	Connect to VFD “Run”	COV	COV	–
CWP Speed	AO	Connect to VFD “Speed”	1 min	60 min	-
CHW Valve	AO	Modulating 2-way valve	1 min	60 min	-
CWS Temp (Bldg. Side)	AI	TS-2C	1 min	60 min	-
CWR Temp (Bldg. Side)	AI	TS-2C	1 min	60 min	-
CWS Temp (Loop Side)	AI	TS-2C	1 min	60 min	-
CWR Temp (Loop Side)	AI	TS-2C	1 min	60 min	-
CHW Flow (Bldg. Side)	AI	FM-1	1 min	60 min	F
CHW Flow (Loop Side)	AI	FM-1	1 min	60 min	F
CHW DP (Bldg. Side)	AI	DPT-1, 0 to 15 psi	1 min	60 min	-
CHW DP (Loop Side)	AI	DPT-1, 0 to 15 psi	1 min	60 min	-
CHW Loop Pressure	AI	P-1, 0 to 100 psi	1 min	60 min	-

9 Hot Water Unit Heater

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Fan Start/Stop	DO	Dry Contact to 120V or 24V control circuit	COV	COV	–
HW Valve	DO	Two position actuator	COV	COV	–
Fan Status	DI	CS-1	COV	COV	–
Zone Temperature	AI	TS-3A	1 min	60 min	–

10 Ductless Split Systems

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Unit Enable/Disable	DO	Dry Contact to 120V or 24V control circuit	COV	COV	–
Zone Temperature	AI	TS-3A	1 min	60 min	-

11 Domestic water flow

Description	Type	Device	Trend Logging		Calibra-tion
			Comm-issioning	Contin-uous	
Building Domestic Water Flow	AI	FM-1 (with local readout)	1 min	60 min	–
Irrigation System Domestic Water Flow	AI	FM-1 (with local readout)	1 min	60 min	-

			Comm-issioning	Contin-uous	
Electric Water Heater Enable/Disable	DO	Dry Contact to 120V or 24V control circuit	COV	COV	–
DHW Supply Temperature	AI	TS-2A	1 min	60 min	-

PART 3 - EXECUTION

3.1 SEQUENCE OF OPERATION

A. General

1. Control sequences listed below are to be the basis of the bid. Contractor shall review them prior to programming and suggest modifications where required to achieve the design intent. Contractor may suggest modifications to improve performance and stability or to simplify or reorganize logic in a manner that provides equal or better performance. Proposed changes in sequences shall be included as part of Submittal Package 2.
2. Include costs for minor program modifications if required to provide stable performance of the system.
3. Unless otherwise indicated, control loops shall be enabled and disabled based on the status of the system being controlled to prevent wind-up.
4. The term “PID loop” is used generically for all control loops and shall not be interpreted as requiring proportional plus integral plus derivative gains on all loops. Unless specifically indicated otherwise, the following guidelines shall be followed:

    a. Use proportional only (P-only) loops for limiting loops (such as CHW/HW flow limiting loops at bridge connections, zone CO_2 limiting loops, etc.) to ensure there is no integral windup.
    b. Do not use the derivative term on any loops unless field tuning is not possible without it.

5. All setpoints, timers, deadbands, etc. listed in sequences shall be capable of being adjusted by the operator without having to access programming whether indicated as “adjustable” in sequences or not. Software (virtual) points shall be used for these setpoints. Fixed scalar numbers shall not be imbedded in programs unless the value will never need to be adjusted.
6. Where zone data (e.g. damper or valve position, control loop signal) is used for reset of the AHU/pump system serving the zone, the zone tag (name) shall be recorded when it is the zone driving the reset (e.g. zone requiring the most cooling). This data shall be available for Reports (see 23 09 26) so that zones that are undersized or otherwise driving the system can be identified for remediation if required.
7. VFD minimum speed setpoints

    a. Minimum speed setpoints for each VFD shall be determined in accordance to description herein.
    b. Minimum speed for each piece of equipment shall be stored in a single software point that shall be used in programming (such as PID loop output range) and its value shall be assigned to the minimum speed setpoint stored in the VFD via the drive network interface. In this way there is only one minimum setpoint, rather than setpoints both in the drive and in software which could differ.

8. Trim & Respond Setpoint Reset Logic

    a. Trim & Respond setpoint reset logic and zone/system reset requests where referenced in sequences shall be implemented as described below.
    b. “Request” are pressure, cooling or heating setpoint reset request type listed for the zone/system provide the following software points:

        1) For each zone or system, and for each setpoint reset request type listed for the zone/system, provide the following software points:

            a) Importance Multiplier (default = 1). This point is used to scale the number of requests the zone/system is generating. A value of zero causes the zone/system’s request to be ignored. A value greater than zero can be used to effectively increase the number of requests from the zone/system based on the critical nature of the spaces served, or to increase the requests beyond the number of ignored requests (defined below) in the Trim & Respond reset block.
            b) Request hours

i. This point accumulates the integral of requests (prior to adjustment of Importance Multiplier) to help identify zones/systems that are driving the reset logic. Every x minutes (adjustable, default 5 minutes), add x/60 times the current number of requests to this request-hours accumulator point.
ii. The request-hours point is reset to zero upon a global command from the system/plant serving the zone/system – this global point simultaneously resets the request–hours point for all zones/systems served by this system/plant.
iii. Cumulative %-request-hours is the zone request-hours divided by the zone run-hours (the hours in any Mode other than Unoccupied Mode) since the last reset, expressed as a percentage.
iv. A Level 4 alarm is generated if the zone Importance Multiplier is greater than zero, the zone %-request-hours exceeds 70%, and the total number of zone run-hours exceeds 40.

2) See zone and air handling system control sequences for logic to generate requests.
3) Multiply the number of requests determined from zone/system logic times the Importance Multiplier and send to the system/plant that serves the zone/system. See system/plant logic to see how requests are used in Trim & Respond logic.

c. Variables. All variables below shall be adjustable from a reset graphic accessible from a hyperlink on the associated system/plant graphic. Initial values are defined in system/plant sequences below. Values for trim, respond, time step, etc. shall be tuned to provide stable control.

Variable	Definition
SP_0	Initial setpoint
SP_{min}	Minimum setpoint
SP_{max}	Maximum setpoint
T_d	Delay timer
T	Time step
I	Number of ignored requests
R	Number of requests from zones/systems
SP_{trim}	Trim amount
SP_{res}	Respond amount
$SP_{res\text{-}max}$	Maximum response per time interval

d. Trim & Respond logic shall reset setpoint within the range SP_{min} to SP_{max}. When the associated device (e.g. fan, pump) is off, the setpoint shall be SP_0. The reset logic shall be active while the associated device is proven on, starting T_d after initial device start command. When active, every time step T, trim the setpoint by SP_{trim}. If there are more than I Requests, respond by changing the setpoint by SP_{res} times (R – I), i.e. (the number of Requests minus the number of Ignored requests). But the net response shall be no more than $SP_{res\text{-}max}$. The sign of SP_{trim} must be the opposite of SP_{res} and $SP_{res\text{-}max}$. For example, if SP_{trim} = -0.1, SP_{res} = +0.15, $SP_{res\text{-}max}$ = +0.35, R = 3, I = 2, then each time step, the setpoint change = -0.1 + (3-2)*0.15 = +0.05. If R = 10, then setpoint change = -0.1 + (10-2)*0.15 = 1.1 but limited to a maximum of 0.35. If R≤2, the setpoint change is -0.1.

9. Lead/lag and lead/standby alternation

a. Even Wear

1) Lead/lag. Unless otherwise noted, parallel staged devices (such as pumps, towers) shall be lead/lag alternated when more than one is off or more than one is on so that the device with the most operating hours is made the later stage device and the one with the least number of hours is made the earlier stage device. For example, assuming there are three devices, if all three are off or all are on, the staging order will simply be based on run hours from lowest to highest. If two devices are on, the one with the most hours will be set to be stage 2 while the other is set to stage 1; this may be the reverse of the operating order when the devices were started. If two devices are off, the one with the most hours will be set to be stage 3 while the other is set to stage 2; this may be the reverse of the operating order when the devices were stopped.
2) Lead/standby. Unless otherwise noted, parallel devices (such as pumps, towers) that are 100% redundant shall be lead/standby alternated when more than one is off so that the device with the most operating hours is made the later stage device and the one with the least number of hours is made the earlier stage device. For example, assuming there are three devices, if all three are off, the staging order will be based on run hours from lowest to highest. If devices run continuously, lead/standby shall switch at an adjustable runtime; standby device shall first be started and proven on before former lead device is changed to standby and shut off.

b. Exceptions

1) Operators shall be able to manual fix staging order via software points on graphics overriding the Even Wear logic above, but not overriding the Failure or Hand Operation logic below.
2) Failure: If the lead device fails or has been manually switched off, the device shall be placed into high level alarm (Level 2) and set to the last stage position in the lead/lag order until alarm is reset by operator. Staging position of remaining devices shall follow the Even Wear logic. A failed device in alarm can only automatically move up in the staging order if another device fails. Note that a device in alarm will be commanded to run if the sequence calls for it to run. In this way the EMCS will keep trying to run device(s) until if finds enough that will operate. Failure is determined by:

a) Variable Speed Fans and Pumps

i. VFD critical fault is ON
ii. Status point not matching its on/off point for 15 seconds when device is commanded on
iii. Supervised HOA at control panel in OFF position
iv. Loss of power (e.g. VFD DC Bus voltage = zero)

b) Constant Speed Fans and Pumps

i. Status point not matching its on/off point for 15 seconds when device is commanded on
ii. Supervised HOA at control panel in OFF position

3) Hand Operation. If a device is on in Hand (for example via an HOA switch or local control of VFD), the device shall be set to the lead device and a low level alarm (Level 4) shall be generated. The device will remain as lead until the alarm is reset by the operator. Hand operation is determined by

a) Variable Speed Fans and Pumps

i. Status point not matching its on/off point for 15 seconds
ii. VFD in local “hand” mode

iii. Supervised HOA at control panel in ON position

b) Constant Speed Fans and Pumps

iii. Status point not matching its on/off point for 15 seconds when device is commanded off
iv. Supervised HOA at control panel in ON position

B. Electricity Rate Calculation

1. A program shall be created that calculates electricity cost as would be billed by the utility using the applicable utility rate schedule.
2. Utility cost shall be calculated real-time and summed for each month and year. For each month, store peak kW, kWh, and cost for each time-of-day rate period. Retain data for one year so that data may be displayed side-by-side as month-this-year and month-last-year. Also store month-to-date and year-to-date data.
3. Enter latest applicable rate schedule from utility upon start-up. Rates shall be stored in software points so that they may be easily displayed and edited.

C. Zones:

1. This section applies to all single zone systems.
2. Setpoints

a. VAV Zones: Each zone shall have separate unoccupied and occupied setpoints, and separate heating and cooling setpoint.

1) The occupied heating setpoint shall be 70°F and the occupied cooling setpoint shall be 74°F.
2) The unoccupied heating setpoint shall be 60°F and the unoccupied cooling setpoint shall be 90°F.

b. Electrical and mechanical rooms

1) The unoccupied and occupied heating setpoint shall be 65°F and the unoccupied and occupied cooling setpoint shall be 85°F.

c. Communications rooms

1) The unoccupied and occupied heating setpoint shall be 65°F and the unoccupied and occupied cooling setpoint shall be 75°F.

d. The software shall prevent:

1) The heating setpoint from exceeding the cooling setpoint minus 1°F (i.e. the minimum deadband shall be 1°F);
2) The unoccupied heating setpoint from exceeding the occupied heating setpoint; and
3) The unoccupied cooling setpoint from being less than the occupied cooling setpoint.

e. Where the zone has a local occupant adjustable setpoint adjustment knob/button:

1) The adjustment shall be capable of being limited in software.

a) As a default, occupied cooling setpoint shall be limited between 72°F and 80°F.
b) As a default, occupied heating setpoint shall be limited between 65°F and 72°F.

2) The adjustment shall move both the existing heating and cooling setpoints upwards or downwards by the same amount unless the limit has been reached.
3) The adjustment shall only be active in Occupied mode.
4) If a demand limit setpoint adjustment is in place, the local setpoint adjustment shall be disabled.

f. The operative setpoint shall be determined by the Zone Group's mode

1) The setpoinis shall be the occupied setpoint during Occupied mode, Warm-up mode, and Cool-down mode.
2) The setpoints shall be unoccupied setpoints during Unoccupied mode, Setback mode, and Setup mode.

g. Hierarchy of setpoint adjustments. The following adjustment restrictions shall prevail in order from highest to lowest priority:

1) Setpoint overlap restriction described herein.
2) Local setpoint adjustment.
3) Scheduled setpoints based on Zone Group mode.

3. Local override. When thermostat override buttons are depressed, the request for Occupied Mode operation shall be sent up to the Zone Group control for 60 minutes. (This will cause all zones in the Zone Group to operate in Occupied Mode to ensure that the system has adequate load to operate stably.)
4. Control Loops:

a. Two separate control loops shall operate to maintain space temperature at setpoint, the Cooling Loop and the Heating Loop. Both loops shall be continuously active.
b. The Cooling Loop shall maintain the space temperature at the active cooling setpoint. The output of the loop shall be a virtual point ranging from 0% (no cooling) to +100% (full cooling).
c. The Heating Loop shall maintain the space temperature at the active heating setpoint. The output of the loop shall be a virtual point ranging from 0% (no heating) to −100% (full heating).
d. Loops shall use proportional + integral logic or fuzzy logic. Proportional-only control is not acceptable, although the integral gain shall be small relative to the proportional gain. P and I gains shall be adjustable from the Operator Workstation.
e. See other sections for how the outputs from these loops are used.

5. Zone Modes:

a. Heating Mode: when the output of the space heating control loop is greater than zero.
b. Cooling Mode: when the output of the space cooling control loop is greater than zero and the output of the heating loop is equal to zero.
c. Dehumidification Mode: when the output of the space humidity control loop is greater than zero.
d. Deadband Mode: when not in either the Heating or Cooling Mode.

6. Alarms:

a. Inhibit alarms after zone setpoint is changed for a period of 10 minutes per degree of change (for example if setpoint changes from 68 °F to 70 °F, inhibit alarm for 20 minutes after the change) and while Zone Group is in Warm-up or Cool-down Modes.

1) If the zone is 3 °F above cooling or below heating setpoint, generate Level 3 alarm.

2) If the zone is 5 °F above cooling or below heating setpoint, generate Level 2 alarm.

b. For zones with CO_2 sensors

1) If the CO_2 concentration is less than 300 ppm, or the zone is in unoccupied mode for more than 2 hours and zone CO_2 concentration exceeds 600 ppm, generate a Level 4 alarm, indicating sensor may be out of calibration.
2) If the CO_2 concentration exceeds setpoint plus 10% for more than 10 minutes generate a Level 3 alarm.

D. VAV Terminal Units (Reheat boxes)

1. See Paragraph 3.1C for setpoints, loops, control modes, alarms, etc.

2. Design airflow rates shall be as scheduled on plans:

a. Zone maximum cooling airflow setpoint (Vcool-max)
b. Zone minimum airflow setpoint (Vmin)
c. Zone maximum heating airflow setpoint (Vheat-max)
d. Zone occupant component of minimum outdoor air setpoint (Vocc-min)
e. Zone building area component of minimum outdoor air setpoint (Varea-min)

3. OA-min is equal to Varea-min if the zone has a CO_2 sensor and equal to the larger of Varea-min and Vocc-min if the zone does not have a CO_2 sensor.

4. The occupied cooling minimum Vmin* shall be zero when the room is unoccupied.

a. If the zone has an occupancy sensor, Vmin* shall be zero when the room is unoccupied.
b. If Vmin is non-zero and less than the lowest possible airflow setpoint allowed by the controls (Vm), Vmin* shall be set equal to Vm. The minimum setpoint Vm shall be determined as follows:

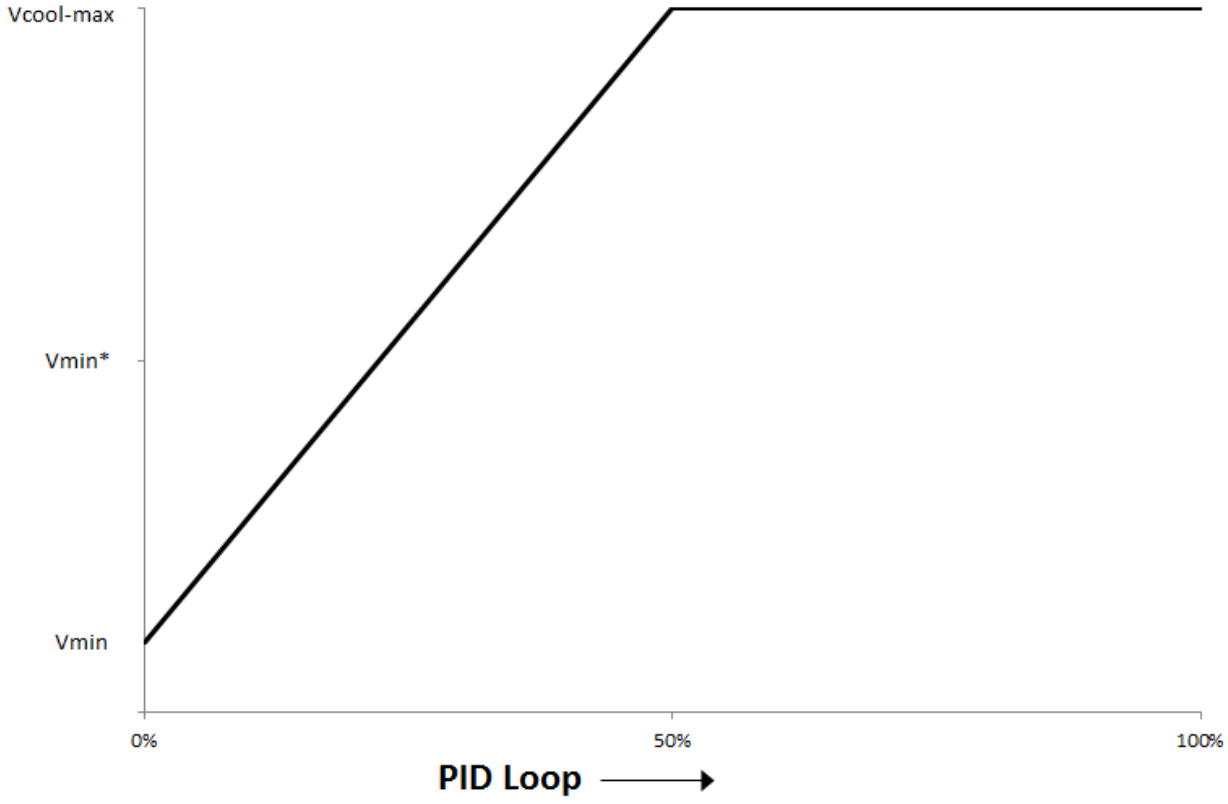
1) Determine the velocity pressure sensor reading VPm in inches H_2O that results in a digital reading from the transducer and A/D converter of 12 bits or counts (assuming a 10 bit A/D converter). This is considered sufficient resolution for stable control (DPT-5 Section 23 09 13).
2) Using the velocity pressure sensor amplification factor *F* provided by the sensor manufacturer for each VAV box sensor size, calculated the minimum velocity v_m for each VAV box size as:

$$v_m = 4005\sqrt{\frac{VP_m}{F}}$$

Where F is not known it can be calculated from the measured CFM at 1 inch signal from the VP sensor

$$F = \left(\frac{4005A}{CFM_{@1"}}\right)^2$$

where A is the nominal duct area (ft^2), equal to

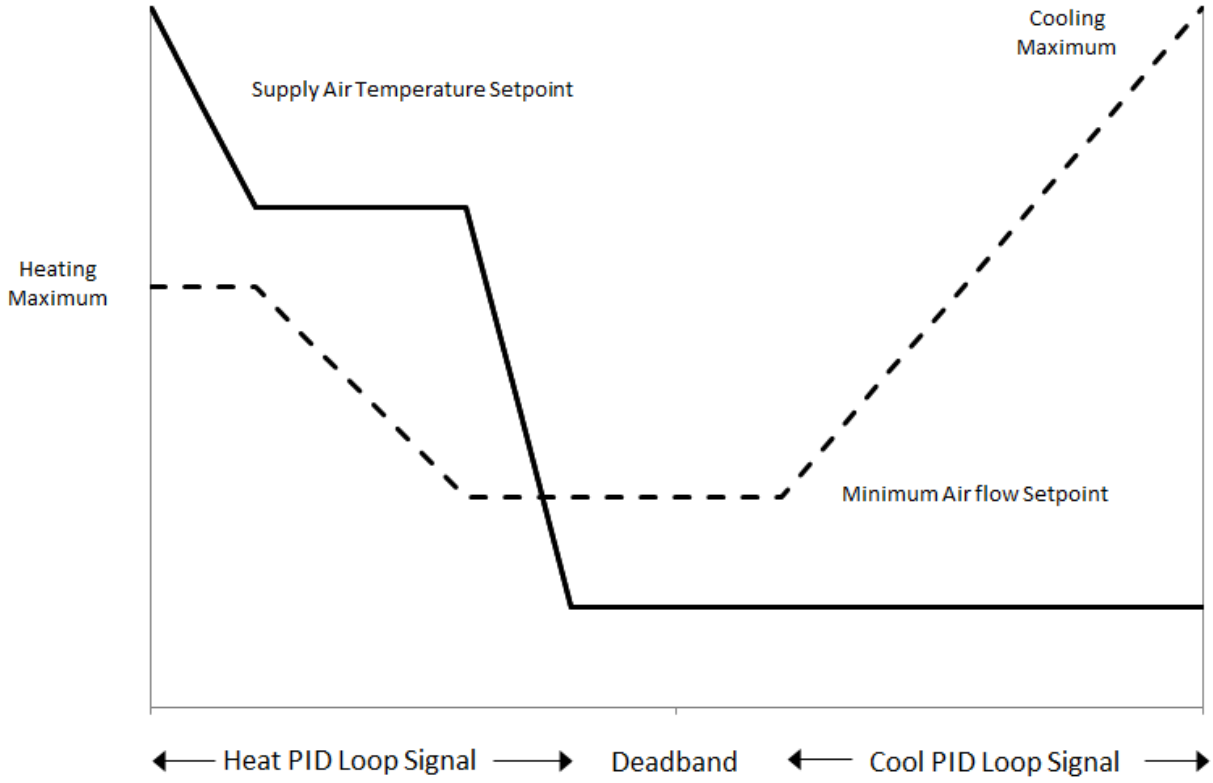


$$A = \pi\left(\frac{D}{24}\right)^2$$

Where D is the nominal duct diameter (inches).

3) Calculate the minimum airflow setpoint allowed by the controls (Vm) for each VAV box size as

$$Vm = v_m A$$



c. If the zone has a CO_2 sensor, during Occupied Mode, a P-only loop shall maintain CO_2 concentration at 1000 ppm; reset 0% at 800 ppm and 100% at 1,000 ppm of CO_2. The output of this loop (0 to 100%) shall be mapped as shown below. The loop output from 0 to 50% shall reset the minimum airflow setpoint to the zone from Vmin up to maximum cooling airflow setpoint Vcool-max. The loop output from 50% to 100% will be used at the system level to reset outdoor air minimum; see AHU controls. Loop is disabled and output set to zero when the zone is no in Occupied Mode.

5. Active maximum and minimum setpoints shall vary depending on the mode of the Zone Group the zone is a part of:

Setpoint	Occupied	Cool-down	Setup	Warm-up	Setback	Unoccupied
Cooling maximum	Vcool-max	Vcool-max	Vcool-max	0	0	0
Minimum	Vmin*	0	0	0	0	0
Heating maximum	Max (Vheat-max, Vmin*)	Vheat-max	0	Vcool-max	Vcool-max	0

6. Control logic is depicted schematically in the figure below and described in the following sections.

a. When the zone is in the Cooling Mode, the Cooling Loop output shall be mapped to the airflow setpoint from the cooling maximum to the minimum airflow setpoints. Hot water valve is closed.
b. When the zone is in the Deadband Mode, the airflow setpoint shall be the minimum airflow setpoint. Hot water valve is closed.
c. When the zone is in the Heating Mode, the Heating Loop shall maintain space temperature at the heating setpoint as follows:

    1) From 0-33%, the Heating Loop output shall reset the discharge temperature from 55 °F to 95 °F.
    2) From 33-66%, if the lead hot water pump is enabled the Heating Loop output shall reset the zone airflow setpoint from the minimum airflow setpoint to the maximum heating airflow setpoint.
    3) From 66-100%, the Heating Loop output shall reset the discharge temperature from 95 °F to 115 °F.
    4) The hot water valve shall be modulated using P+I loop to maintain the discharge temperature at setpoint. (Directly controlling HW valve off zone temperature PID loop is not acceptable.)

d. In any mode, the HW valve shall be modulated to maintain a supply air temperature no lower than 50 °F. (this is to prevent overly cold supply air temperatures when the AHU is providing high outdoor air rates since the AHU does not have a reheat coil.)
e. The VAV damper shall be modulated to maintain the measured airflow at setpoint.

7. Alarms

    a. Low airflow

1) If the measured airflow is less than 70% of setpoint for 5 minutes, generate a Level 3 alarm.
2) If the measured airflow is less than 50% of setpoint for 5 minutes, generate a Level 2 alarm.

b. Low supply air temperature

1) If the building HW pumps are proven on and the supply air temperature is 15 °F less than setpoint for 10 minutes, generate a Level 3 alarm.
2) If the building HW pumps are proven on and the supply air temperature is 30 °F less than setpoint for 10 minutes, generate a Level 2 alarm.

c. Airflow sensor calibration. If the fan serving the zone has been shut off for 10 minutes and airflow sensor reading is above 20 cfm, generate a Level 3 alarm.

8. Testing/Commissioning Overrides: Provide software points that interlock to a system level point to

a. Force zone airflow setpoint to zero
b. Force zone airflow setpoint to Vcool-max
c. Force zone airflow setpoint to Vmin
d. Force damper full closed/open
e. Force heating to off/closed
f. Reset request-hours accumulator point to zero (provide one point for each reset type listed below)

9. System Requests

a. Static Pressure Reset Requests

1) If the Damper Loop is less than 85%, send 0 requests.
2) If the Damper Loop is greater than 95%, send 1 request.
3) If the zone airflow is below the airflow setpoint sufficient to generate a Level 3 alarm (see alarms above), send 2 requests.
4) If the zone airflow is below the airflow setpoint sufficient to generate a Level 2 alarm (see alarms above), send 3 requests.

b. Heating HWST Reset Requests

1) If the HW valve is less than 85%, send 0 requests.
2) If the HW valve is greater than 95%, send 1 request.
3) If the supply air temperature is below setpoint sufficient to generate a Level 3 alarm (see alarms above), send 2 requests.
4) If the supply air temperature is below setpoint sufficient to generate a Level 2 alarm (see alarms above), send 3 requests.

E. Zone Groups (aka Isolation Areas)

1. Each system shall be broken into separate “Zone Groups” composed of a collection of one or more zones served by the air handling system.
2. Each Zone Group shall have separate occupancy schedules and operating modes from other Zone Groups served by the air handling system. All zones in the Zone Group shall be in the same operating mode.
3. Individual Zone Groups shall be as defined below: The default schedule is also listed, confirm

schedules with Using Agency prior to programming.

a. AHU-1 through AHU-4 shall have separate zone groups for zones served by each air-handling unit on each floor. For example AHU-1 has 2 zone groups

1) The default occupancy schedule for all Zone Groups shall be

a) Occupied: 7:00 am to 11 pm Monday to Friday, 8:00 AM to 8:00 PM Saturday and Sunday

b. Fan Coil Units

1) Occupied: 7:00 am to 11 pm Monday to Friday, 8:00 AM to 8:00 PM Saturday and Sunday

4. Provide software switches to override all zones served by the Zone Group. Provide a single software switch for each of the zone override switches listed under terminal box control above. When the Zone Group override switch value is changed, the terminal box zone override switch value for each zone in the Zone Group shall change to the same value. This only occurs when the switch changes value; the switch at each zone shall be capable of being changed to a different value from the Zone Group switch. These software switches are for commissioning and need not be shown on graphics.
5. Zone Group Operating Modes: Each Zone Group shall have the following modes:

a. Normal (Occupied) mode: A Zone Group is in the occupied mode when any of the following is true:

1) The time of day is between the Zone Group's scheduled occupied start and stop times.
2) Any zone local override timer (initiated by local override button) is nonzero.

b. Warm-up mode. Warm-up start time shall be determined based on the zone in the Zone Group whose space temperature is furthest below its occupied heating temperature setpoint, the outside air temperature, and a building mass/capacity factor. This factor shall be manually adjusted or self-tuned by the program based on internal trending so that all zones in the Zone Group are brought up to their occupied setpoint by the scheduled occupied start hour. The tuning period mode shall be turned on or off by a software switch (to allow tuning to be stopped after the system has been trained). Warm-up mode shall start no earlier than 3 hours before the scheduled occupied start hour and shall end at the scheduled occupied start hour.
c. Cool-down mode. Cool-down shall be determined based on the zone in the Zone Group whose space temperature is furthest above its occupied cooling temperature setpoint, the outside air temperature, and a building mass/capacity factor. This factor shall be manually adjusted or self-tuned by the program based on internal trending so that all zones in the Zone Group are brought down to their occupied setpoint by the scheduled occupied start hour. The tuning period mode shall be turned on or off by a software switch (to allow tuning to be stopped after the system has been trained). Cool-down mode shall start no earlier than 3 hours before the scheduled occupied start hour and shall end at the scheduled occupied start hour.
d. Setback mode. During other than normal mode, and warm-up mode, if any 2 (adjustable; set to all zones if there are fewer in Zone Group) zone(s) in the Zone Group falls 2°F below its active unoccupied setback setpoint, until all spaces in the Zone Group are above their active setback setpoints.
e. Setup mode. During other than normal mode, warm-up mode, and setback mode, if any 2 (adjustable; set to all zones if there are fewer in Zone Group) zone(s) in the Zone Group rises 2°F above its active unoccupied setup setpoint until all spaces in the Zone Group are below their active setup setpoints.

f. Unoccupied mode. When the Zone Group is not in any other mode.

F. Air Handling Unit System Modes:

1. AHU system modes are the same as the mode of the Zone Groups served by the system. When Zone Groups served by an air handling system are in different modes, the following hierarchy applies (highest one sets AHU mode):

a. Occupied mode
b. Cool-down mode
c. Setup mode
d. Warm-up mode
e. Setback mode
f. Unoccupied mode

G. VAV Air Handling Units (AHU-1 through AHU-4)

1. Supply Fan Control

a. Supply Fan Control

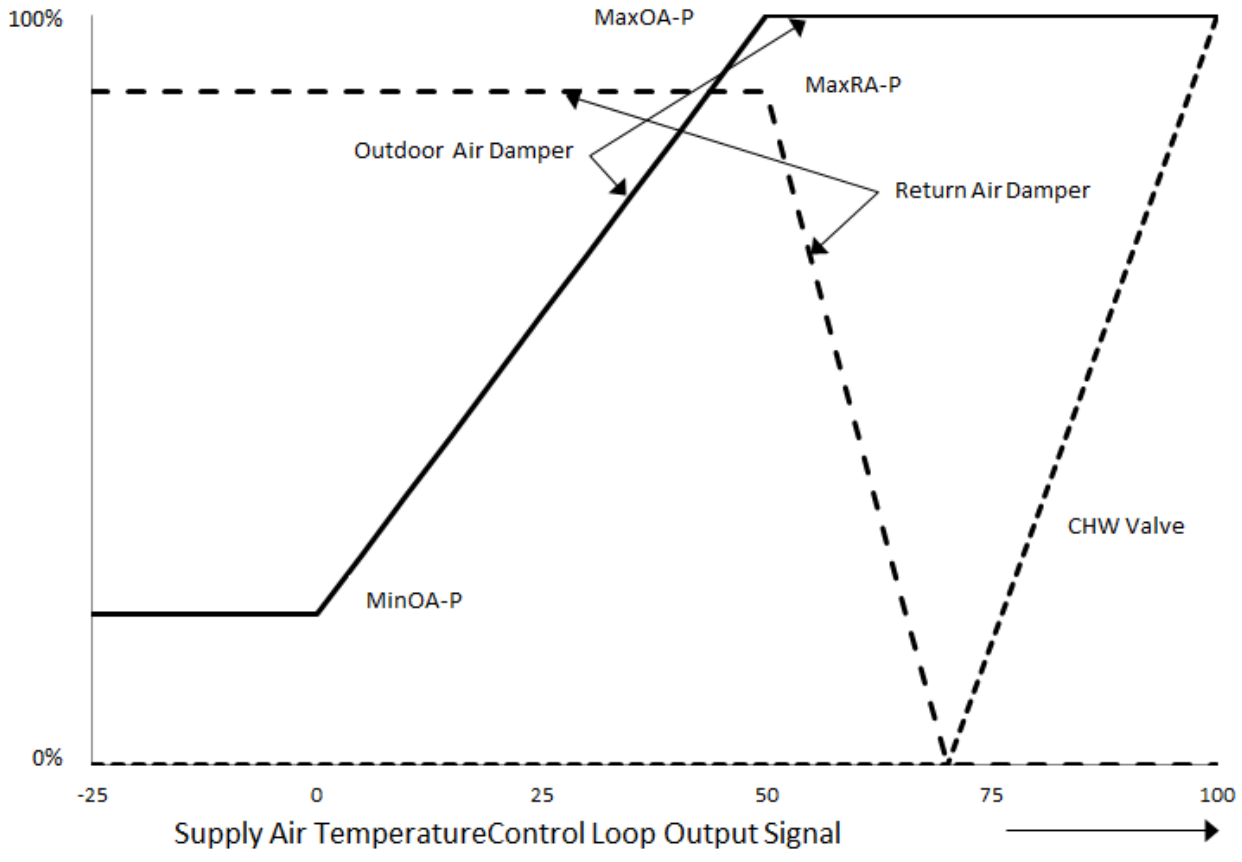
1) AHU fan shall run when system is in any mode other than Unoccupied Mode.
2) Fan VFD's shall be hard-wire interlocked through smoke detectors, high discharge pressure, and low mixed air temperature safety circuit. The safety circuit shall be tripped when high-limit DP switches sense pressure above 3.0 inches (adjustable) at the fan discharge, smoke detector auxiliary contacts are energized or the low-limit thermostat tripped, locking out the fans until they are reset by the operator.
3) Totalize current airflow rate from VAV boxes and display on AHU graphic at discharge duct.

b. Static Pressure Setpoint Reset

1) Static pressure setpoint: Setpoint shall be reset using Trim & Respond logic with the following parameters:

Variable	Definition
SP_0	0.5 inches
SP_{min}	0.1 inches
SP_{max}	Per 23 05 93
T_d	10 minutes
T	2 minutes
I	2
R	Zone Cooling Static Pressure Reset Requests
SP_{trim}	-0.05 inches
SP_{res}	+0.06 inches
$SP_{res-max}$	+0.13 inches

c. Static Pressure Control



1) Fan speed shall be controlled to rise very slowly to prevent high pressure trips in case all VAV boxes are closed (they should close during unoccupied periods) or in case fire

dampers are closed. This can be done by configuring the VFD ramp rate or controlling ramp rate in EMCS software.

2) Supply fan speed is controlled to maintain duct static pressure at setpoint when the fan is proven on. See VFD minimum speed described herein. Where the Zone Groups served by the system are small, provide multiple sets of PID gains that are used in the PID loop as a function of a load indicator (such as supply fan airflow rate, the area of the Zone Groups that are occupied, etc.)

2. Supply Air Temperature Control

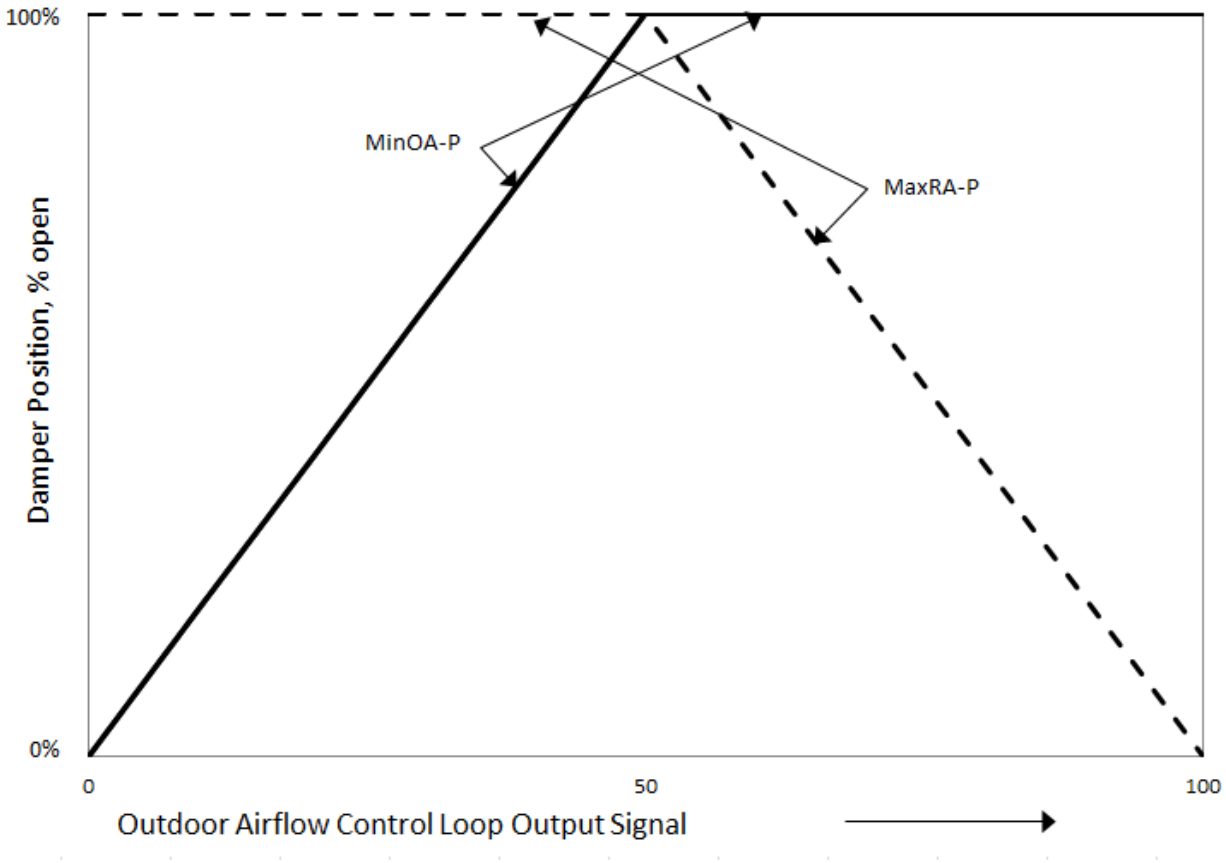
a. Control loop is enabled when the supply air fan is proven on, and disabled and output set to zero otherwise. When loop is disabled, slowly reduce loop output to zero to prevent sudden pressure changes in the hydronic distribution system.
b. Supply Air Temperature Setpoint: 55 °F.
c. Supply air temperature shall be controlled to setpoint using a PID loop whose output is mapped to sequence the outdoor air damper, return air damper, enthalpy (energy recovery) wheel, enthalpy wheel bypass dampers, and chilled water valve as shown in the diagram below. Outdoor air and return air dampers are sequenced rather than complementary (as per most standard sequences) to reduce fan power at part loads. Exact x-axis points in the figure shall be determined by Contractor to provide stable control. Outdoor air and return air damper minimum and maximum positions are limited for economizer lockout and to maintain minimum outdoor airflow rate as indicated below.

3. Pre-heat Coil Temperature Control

a. Pre-heat coil control loop is enabled when the supply fan is proven on and the mixed air

temperature is below 50 ˚F. Pre-heat coil control loop shall be disabled and output set to zero otherwise.

b. Leaving Pre-Heat Coil Air Temperature Setpoint: 53 ˚F.



4. Minimum Outdoor Air Control

a. See zone CO_2 controls under VAV zone controls.
b. Outdoor air absolute minimum and design minimum setpoints are recalculated continuously based on the Mode of the zones being served.

1) AbsMinOA* is the sum of Varea-min for all zones in all Zone Groups that are in Occupied Mode, but shall be no larger than the absolute minimum outdoor air rate, “Abs Min OA” scheduled on Drawings.
2) DesMinOA* is the sum of OA-min for all zones in all Zone Groups that are in Occupied Mode, but shall be no larger than the design minimum outdoor air rate, “Occ Min OA” scheduled on Drawings.

c. OA Setpoint (MinOAsp). The minimum outdoor air setpoint (MinOAsp) shall be reset based on the highest zone CO_2 PID loop signal from AbsMinOA* at 50% signal to DesMinOA* at 100% signal.
d. Minimum Outdoor Air Control Loop

1) Minimum outdoor air control loop is enabled when the AHU is in Occupied Mode and disabled and output set to zero otherwise.
2) The outdoor airflow rate shall be maintained at the minimum outdoor air setpoint MinOAsp by a reverse-acting PID loop whose output is mapped to minimum outdoor air damper signal, MinOA-P, and maximum return air damper signal, MaxRA-P, as indicated in the figure below.

5. Economizer Lockout: The normal sequencing of the economizer dampers (above) shall be disabled whenever the outdoor air temperature exceeds 65 °F and enabled otherwise. Enthalpy wheel shall be energized and bypass dampers closed when economizer is locked out. Once the economizer is disabled, it shall not be re-enabled within 10 minutes, and vice versa. When economizer is enabled, MaxOA-P = 100%, enthalpy wheel disabled and bypass dampers opened. When economizer is first disabled, the return air damper shall be fully opened, wait 15 seconds, then set MaxOA-P to MinOA-P and release return air damper for minimum outdoor air control (enthalpy wheel is enabled and bypass dampers closed). See minimum outdoor air control above for minimum outdoor air and maximum return air damper setpoints.

6. Relief Fan (all four relief fans shall receive the same output signal)

    a. Relief fans shall be enabled when the associated supply fan is enabled in Occupied Mode (note: the associated economizer does not have to be enabled) and shall be disabled otherwise.
    b. Building static pressure shall be time averaged with a sliding 5 minute window (to dampen fluctuations). The averaged value shall be that displayed and used for control.
    c. A P-only control loop maintains the building pressure at a setpoint of 0.05 inches (adjustable) with an output ranging from 0 to 100%. The loop is disabled and output set to zero when relief system is disabled.
    d. Fan speed signal to all operating fans shall be the same and shall be equal to the PID signal but no less than the minimum speed. See VFD minimum speed described herein for minimum speed setpoint. Except for Stage 0, discharge dampers of all relief fans shall be open only when fan is commanded on. (The logic below is intended to use barometric relief as the first stage then maintain fans on at low speed to minimize noise and reduce losses through discharge dampers and louvers.)

1) Stage 0: When relief system is enabled and the PID loop output is above 5%, open the motorized dampers to all relief fans serving the building that are enabled; close the dampers when the loop output drops to 0% for 5 minutes.
2) Stage Up: When PID loop is above minimum speed plus 10%, enable relief fans. Fan speed signal to all enabled relief fans shall be the same and shall be equal to the control lop signal but no less than the minimum speed. When control loop signal drops to minmimum speed for 1 minute, fans shall stop but relief dampers shall remain open for barometric relief per item 1) above.

e. For fans in alarm, discharge damper shall be closed.

7. Freeze Protection

a. If the leaving pre-heat coil air temperature drops below 40°F for 5 minutes, send two (or more, as required to ensure that heating plant is active) Hot Water Requests, override the outside air damper to the minimum position, and modulate the pre-heat coil to maintain a leaving pre-heat coil air temperature of at least 42°F. Disable this function when leaving pre-heat coil air temperature rises above 45°F for 5 minutes.
b. If the leaving pre-heat coil air temperature drops below 38°F for 5 minutes, fully close the outdoor air damper for one hour, and set a Level 3 alarm noting that minimum ventilation was interrupted. After one hour, the unit shall resume minimum outdoor air ventilation and enter the previous stage of freeze protection (see 0).
c. Upon signal from the freezestat or if supply air temperature drops below 38°F for 15 minutes or below 34°F for 5 minutes, shut down supply and return/relief fan(s), close outdoor air damper, make the minimum cooling coil valve position 20%, and energize the hot water and chilled water pump systems. Also send two (or more, as required to ensure that heating plant is active) Hot Water Requests, modulate the heating coil to maintain the higher of the supply air temperature or the mixed air temperature at 80°F, and set a Level 2 alarm indicating the unit is shut down by freeze protection.

1) If a freeze protection shutdown is triggered by a low air temperature sensor reading, it shall remain in effect until it is reset by a software switch from the operator's workstation. (If a freeze stat with a physical reset switch is used instead, there shall be no software reset switch.)

8. Alarms

a. Maintenance interval alarm when fan has operated for more than 1500 hours: Level 5. Reset interval counter when alarm is acknowledged.
b. Fan alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.

1) Commanded on, status off: Level 2
2) Commanded off, status on: Level 4

c. Filter pressure drop exceeds alarm limit: Level 5. The alarm limit shall vary with fan speed as follows:

$$DP_x = DP_{100}(x)^{1.4}$$

Where DP_{100} is the high limit pressure drop at design cfm (determine limit from filter manufacturer) and DP_x is the high limit at speed signal x (expressed as a fraction of full signal). For instance, the setpoint at 50% of full speed would be $(0.5)^{1.4}$ or 38% of the design high limit pressure drop.

d. High supply air temperature (more than 5 °F above setpoint) off cooling coils when coil control loop is active for longer than 15 minutes: Level 3.
e. If the outside air temperature is above the supply air temperature setpoint and the economizer is enabled and the mixed air temperature is more than 2 °F different from the outside air temperature for more than 30 minutes continuously; OR if the outdoor air temperature is more than 5 °F below the supply air temperature setpoint and the chilled water valve is open: Level 4 indicating economizer damper control problems.
f. Low static pressure (more than 0.25 inches below setpoint) when fan control loop is active for longer than 5 minutes: Level 3.
g. Outdoor airflow less than setpoint by 10% for 10 minutes when loop is active: Level 3.
h. High building pressure (more than 0.10" for 10): Level 3
i. Low building pressure (less than 0.0"): Level 4

9. Testing/Commissioning Overrides: Provide software points that interlock to a chilled and hot water system level to

    a. Force chilled water valve full open
    b. Force chilled water valve full closed
    c. Force hot water valve full open
    d. Force hot water valve full closed

10. Plant Requests

    a. Heating HWST Reset Requests

        1) If the HW valve is less than 85%, send 0 requests.
        2) If the HW valve is greater than 95%, send 1 request.
        3) If the supply air temperature is below setpoint sufficient to generate a Level 3 alarm (see alarms above), send 2 requests.

H. Fan Coil units

1. See paragraph 3.1E for zone controls.
2. Fan starts and stops based on time schedule.
3. Supply fan speed control: constant volume/constant speed
4. Supply Air Temperature Setpoint Control

    a. When supply fan is proven on, heating and cooling shall be controlled as follows:

        1) When the zone served by the system is in the Deadband Mode, supply air temperature setpoint shall be average of the active heating and cooling setpoints.
        2) When the zone served by the system is in the Cooling Mode, supply air temperature shall be reset from Deadband setpoint at 0% cooling PID signal down to 53 ˚F (adjustable) at 50% PID signal.
        3) When the zone served by the system is in the Heating Mode, supply air temperature shall be reset from Deadband setpoint at 0% heating PID signal up to 90 ˚F (adjustable) at 50% PID signal.

5. Supply Air Temperature Control

    a. Control loop is enabled when the supply air fan is proven on, and disabled and output set to zero otherwise. When loop is disabled, slowly reduce loop output to zero to prevent sudden pressure changes in the CHW and HW flow distribution systems.
    b. Supply air temperature shall be controlled to setpoint using a PID loop whose output is the

chilled water valve and hot water valve positions as shown in the figure below.

6. Alarms

   a. Maintenance interval alarm when fan has operated for more than 1500 hours: Level 5. Reset interval counter when alarm is acknowledged.
   b. Fan alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.

      1) Commanded on, status off: Level 2
      2) Commanded off, status on: Level 4

   c. High supply air temperature (more than 5 ˚F above setpoint) when coil control loop is active for longer than 15 minutes and chilled water pumps are proven on: Level 3.
   d. Low supply air temperature (more than 5 ˚F below setpoint) when coil control loop is active for longer than 15 minutes and hot water pumps are proven on: Level 3.

7. Testing/Commissioning Overrides: Provide software points that interlock to a chilled and hot water system level to

   a. Force chilled water valve full open
   b. Force chilled water valve full closed
   c. Force hot water valve full open
   d. Force hot water valve full closed

8. Plant Requests

   a. Heating HWST Reset Requests

      1) If the HW valve is less than 85%, send 0 requests.
      2) If the HW valve is greater than 95%, send 1 request.
      3) If the supply air temperature is below setpoint sufficient to generate a Level 3 alarm (see alarms above), send 2 requests.

I. Toilet and other EMCS controlled exhaust fans.

1. Exhaust fans shall enabled when any of the associated system supply fans are proven on and system is in the occupied mode. Fans shall be disabled otherwise.
2. Alarms

    a. Maintenance interval alarm when fan has operated for more than 3000 hours: Level 5 Reset interval counter when alarm is acknowledged.
    b. Fan alarm is indicated by the status input being different from the output command after a period of 60 seconds after a change in output status.

        1) Commanded on, status off: Level 2.
        2) Commanded off, status on: Level 4.

J. Restroom exhaust fan (Motion detector controlled)

1. Restroom exhaust fan shall be controlled via a motion detector. Fan shall be enabled upon detection of motion in the space. Fan shall continue to run for 15 minutes (adjustable) after last motion sensing and then shall be disabled. Fan shall be off otherwise.

K. Thermostat controlled exhaust fan

1. The fan shall run when zone is in Cooling Mode. It shall be off otherwise.
2. Alarms

    a. Maintenance interval alarm when fan has operated for more than 3000 hours: Level 5 Reset interval counter when alarm is acknowledged.
    b. Fan alarm is indicated by the status input being different from the output command after a period of 60 seconds after a change in output status.

        1) Commanded on, status off: Level 2.
        2) Commanded off, status on: Level 4.

    c. High space temperature (>10 ˚F above setpoint) when control loop is active for longer than 15 minutes: Level 3

L. Humidistat controlled exhaust fan

1. Upon a rise in crawlspace humidity above the humidistat setpoint, the exhaust fan shall be enabled. Once the crawlspace humidity fall below the humidistat setpoint the exhaust fan shall be disabled.

M. HW Heat Exchanger and HW pumps

1. The HW heat exchanger shall be enabled when any heating control valve signal is greater or equal to 15% for 10 minutes and shall stop when all are 0% for 1 minute or all are less than 5% for 5 minutes. Once disabled, the heat exchanger shall stay disabled for a minimum of 10 minutes.
2. HW pumps shall be lead/lag alternated per Paragraph 3.1A.9.
3. Once the HW heat exchanger is enabled, the lead pump shall start and its speed mapped from its minimum speed to 100% as the DP Loop signal ranges from 0% to 100%. The lead pump shall stop when the HW heat exchanger is disabled.
4. Differential pressure setpoint shall be determined within the range of 1 psi to DP-MAX by a slow direct-acting control loop whose control point is the position of the most open valve and whose setpoint is 90% open. In other words DP setpoint is reset to maintain the valve requiring the most

differential pressure at 90% open. DP-MAX is the design DP setpoint determined in conjunction with the balancing agency. See Sections 23 05 93 Testing, Adjusting and Balancing.

5. HW Supply Temperature Control

    a. Hot Water Supply Temperature Reset

        1) Hot water supply temperature setpoint shall be reset using Trim & Respond logic (see Trim & Respond logic description herein) based on hot water pump status with the following parameters:

Variable	Definition
SP_0	SPmax
SP_{min}	90°F
SP_{max}	140°F
T_d	10 minutes
T	5 minutes
I	2
R	Heating HWST Reset Requests
SP_{trim}	-2°F
SP_{res}	+3°F
$SP_{res-max}$	+7°F

    b. Campus Loop HW Valve Control

        1) Control loop is enabled when the HW heat exchanger is enabled
        2) HW supply temperature shall be controlled to setpoint using a PID loop whose output is the HW valve position.

6. Alarms

    a. Maintenance interval alarm when pump has operated for more than 1500 hours: Level 5. Reset interval counter when alarm is acknowledged.
    b. Low heat exchanger leaving hot water temperature (more than 15°F below setpoint) for more than 15 minutes when heat exchanger has been enabled for longer than 15 minutes: Level 3.
    c. Pump alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status. If lead pump alarm is enabled, standby pump shall become lead pump and operate as such.

        1) Commanded on, status off: Level 2
        2) Commanded off, status on: Level 4

N. Chilled Water Heat Exchanger and CHW pumps

1. The CHW heat exchanger shall be enabled when any cooling control valve signal is greater or equal to 15% for 10 minutes and shall stop when all are 0% for 1 minute or all are less than 5% for 5 minutes. Once disabled, the heat exchanger shall stay disabled for a minimum of 10 minutes.
2. CHW pumps shall be lead/lag alternated per Paragraph 3.1A.9.
3. Once the CHW heat exchanger is enabled, the lead pump shall start and its speed mapped from its minimum speed to 100% as the DP Loop signal ranges from 0% to 100%. The lead pump shall stop when the CHW heat exchanger is disabled.
4. Differential pressure setpoint shall be determined within the range of 1 psi to DP-MAX by a slow direct-acting control loop whose control point is the position of the most open valve and whose

setpoint is 90% open. In other words DP setpoint is reset to maintain the valve requiring the most differential pressure at 90% open. DP-MAX is the design DP setpoint determined in conjunction with the balancing agency. See Sections 23 05 93 Testing, Adjusting and Balancing.

5. CHW Supply Temperature Control

    a. Chilled Water Supply Temperature = 44°F
    b. Campus Loop CHW Valve Control

        1) Control loop is enabled when the CHW heat exchanger is enabled
        2) CHW supply temperature shall be controlled to setpoint using a PID loop whose output is the CHW valve position.

6. Alarms

    a. Maintenance interval alarm when pump has operated for more than 1500 hours: Level 5. Reset interval counter when alarm is acknowledged.
    b. Low heat exchanger leaving hot water temperature (more than 15°F below setpoint) for more than 15 minutes when heat exchanger has been enabled for longer than 15 minutes: Level 3.
    c. Pump alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status. . If lead pump alarm is enabled, standby pump shall become lead pump and operate as such.

        1) Commanded on, status off: Level 2
        2) Commanded off, status on: Level 4

O. Hot Water Unit Heater

1. The unit heater shall be enabled when zone is in Heating Mode. It shall be disabled otherwise.
2. Fan shall run when unit heater is enabled.
3. HW control valve shall cycle open and closed to maintain the zone heating setpoint.
4. Alarms

    a. Low zone temperature (more than 10°F below setpoint) for more than 15 minutes when unit heater has been enabled for longer than 15 minutes: Level 3.

P. Domestic Water Heater

1. Domestic water heater shall be enabled when the associated zone group is in the occupied mode. Domestic water heater shall be disabled otherwise.

    a. EWH-1 on Level 1 shall be enabled when AHU - 1 or AHU -2 are in the occupied mode
    b. EWH-2 on Level 2 shall be enabled when AHU - 3 is in the occupied mode
    c. EWH-3 on Level 3 shall be enabled when AHU - 4 is in the occupied mode

Q. Ductless Split Systems

1. The ductless split system shall be enabled by the EMCS 24/7 and shall run subject to its own internal safeties and wall mounted thermostat control.
2. EMCS shall monitor zone temperature
3. Alarms

    a. Low zone temperature (more than 10°F below setpoint) for more than 15 minutes when ductless split system has been enabled for longer than 15 minutes: Level 3.
    b. High zone temperature (more than 10°F above setpoint) for more than 15 minutes when ductless split system has been enabled for longer than 15 minutes: Level 3.

R. Miscellaneous Alarms

1. Points in Hand (Operator Override) via Workstation command (including name of operator who made the command) or via supervised HOA switch at output: Level 4.
2. Equipment alarm (for equipment with alarm contacts such as VFDs, emergency generator, etc.): Level 2.
3. Panel or LAN failure: Level 2
4. Loss of communication with any device via Gateway (e.g. VFD) for more than 30 seconds: Level 2 (alarm shall indicate which specific device is not responding).

END OF SECTION 23 09 29

SECTION 23 09 33 – EMCS SYSTEM COMMISSIONING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. Provide the following:

1. EMCS and equipment testing and start-up
2. Validation of proper and thorough installation of EMCS and equipment
3. Functional testing of control systems
4. Demonstration testing of control systems
5. Documentation of tests, procedures, and installations
6. Coordination of EMCS training
7. Documentation of EMCS Operation and Maintenance materials

B. Refer to Section 23 09 00 for general requirements.

1.3 RELATED WORK AND REQUIREMENTS

A. Section 23 05 93 Testing, Adjusting, and Balancing

B. Section 23 09 00 Energy Management and Control System (EMCS) − General

C. Section 23 09 13 EMCS Basic Materials and Devices

D. Section 23 09 16 EMCS Operator Interfaces

E. Section 23 09 19 EMCS Field Panels

F. Section 23 09 23 EMCS Communication Devices

G. Section 23 09 26 EMCS Software and Programming

H. Section 23 09 29 EMCS Points and Sequence of Operation

I. Section 01 91 00 Commissioning

J. Section 23 08 00 Mechanical Commissioning

1.4 COORDINATION

A. Assist Commissioning Coordinator as specified in Section 01 91 00 Commissioning, including

attending commissioning meetings.

B. Testing, Adjusting, and Balancing

1. Coordinate with TAB contractors in test and balance work as specified in Section 23 05 93 Testing, Adjusting, and Balancing. A significant number of balancing procedures require the EMCS to be operational and require Contractor time to assist the TAB contractor in their work.
2. Terminal unit calibration:

a. Provide software and/or portable devices for terminal unit calibration per Section 23 09 26.
b. Connections shall be provided local to the device being calibrated. For instance, for VAV boxes, connection of the operator's terminal shall be either at the sensor or at the terminal box.

C. Coordinate with Division 23 and 26 contractors in the performance of pre-functional, functional, and post-occupancy commissioning activities.

1.5 SEQUENCING

A. The following list outlines the general sequence of events for submittals and commissioning:

1. Submit Submittal Package 1 (Hardware and Shop Drawings) and receive approval.
2. Initiate installation of EMCS hardware, devices and wiring.
3. Develop point database and application software.
4. Simulate sequencing and debug programming off-line to the extent practical.
5. Submit Submittal Package 2 (Programming and Graphics) and receive approval.
6. Complete installation of EMCS hardware, devices and wiring.
7. Install point database and application software in field panels.
8. Submit Submittal Package 3 (Functional Testing) and receive approval.
9. Perform EMCS Pre-functional Tests (start up, calibration and tuning) and submit Pre-functional Tests for approval.
10. Field test application programs prior to functional testing.
11. Receive EMCS Pre-functional Test Report approval and approval to schedule Functional Tests.
12. Prepare and initiate commissioning Trend Logs.
13. Assist TAB contractor in TAB tests and determining setpoints as specified in Section 23 05 93.
14. Perform and record functional tests and submit Functional Test Report for approval.

a Some tests may not be possible due to weather conditions. These tests may be deferred to post-occupancy period.

15. Submit Package 4 (Training Materials) and receive approval.
16. Receive EMCS Functional Test Report approval and approval to schedule Demonstration Tests.
17. Perform Demonstration Tests to Commissioning Coordinator and Professional and submit Demonstration Test Report.
18. Receive acceptance of Demonstration Tests.
19. Train Using Agency personnel on EMCS operation and maintenance.
20. Substantial Completion.
21. Submit Package 5 (Post-Construction Trend Logs) in format specified for review and approval.

22. Receive approval of successful Trend Log tests, or retest as required.
23. Complete all items in Completion Requirements per Section 23 09 00.
24. Provide administration level password access to the Using Agency.
25. Final Acceptance.
26. Begin Warranty Period.
27. Prepare and initiate post-occupancy Trend Logs.
28. Perform deferred alternate season functional tests and submit amended Functional Test Report for approval.
29. Receive amended EMCS Functional Test Report approval.
30. Two months prior to end of Warranty Period, submit Package 6 (End-of-Warranty Trend Logs) in format specified for review and approval.
31. Receive approval of successful Trend Log tests, or retest as required.
32. Revise and submit record documents and O&M Manuals.
33. Update all software as specified.
34. End of Warranty Period.

1.6 FUNCTIONAL TEST DOCUMENTATION

A. Pre-functional Tests

1. Prepare forms to document the proper startup of the EMCS.
2. All equipment shall be included test forms including but not limited to:

    a. Wiring: End-to-end checkout of all wiring at terminations. Power to all controllers and actuators. Confirmation of emergency power where specified.
    b. Digital Outputs: proper installation, normal position, response to command at CU
    c. Digital Inputs: proper installation, device test, response at CU
    d. Analog Outputs: proper installation of devices, verification of maximum and minimum stroke
    e. Analog Inputs: proper installation of sensors, calibration
    f. Panels: Confirmation of location, power source (electrical circuit used), confirmation of emergency power where specified.
    g. Alarms and Safeties: Verification of alarm routing to all specified devices and correct hierarchy. Example: confirm alarm routing to cell phones, email, servers, remote workstations. Confirm that appropriate alarm levels are routed to appropriate devices.
    h. Loop Tuning: Document setting of P/I parameters for all loops, chosen setpoints, time delays, loop execution speed.
    i. Network Traffic: Document speed of screen generation, alarm and signal propagation in system with all required commissioning trends active.

3. Each form shall have a header or footer where the technician performing the test can indicate his/her name and the date of the test.
4. Submit forms for approval in Submittal Package 3.
5. Complete work, document results on forms, and submit for approval as Pre-Functional Test Report.

B. Functional Tests

1. Professional will prepare functional testing forms after Submittal Package 2 has been reviewed and approved. Tests will be designed to test all sequences in a formal manner with simulations and expected outcomes.
2. Review tests and recommend changes that will improve ease of testing or avoid possible system damage, etc.
3. Adapt forms from Professional into electronic format. Each form shall have a header or

footer where the technician performing the test can indicate his/her name and the date of the test.

4. Complete work, document results on forms, and submit for approval as Functional Test Report.

C. Assist Commissioning Authority/Coordinator/Professional as specified in Section 01 91 00 Commissioning, including attending commissioning meetings.

D. Coordinate with Work specified in Division 23 Mechanical Commissioning and Division 26 Electrical Commissioning.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. Instrumentation required to verify readings, calibrate sensors, and test the system and equipment performance shall be provided by Contractor.

B. All equipment used for testing and calibration shall be NIST/NBS traceable and calibrated within the preceding 6-month period. Certificates of calibration shall be submitted.

C. Test equipment used for testing and calibration of field devices shall be at least twice as accurate as respective field device (e.g., if field device is ±0.5% accurate, test equipment shall be ±0.25% accurate over same range).

PART 3 - EXECUTION

3.1 PRE-FUNCTIONAL TESTS

A. General

1. Inspect the installation of all devices. Review the manufacturer's installation instructions and validate that the device is installed in accordance with them.
2. Verify proper electrical voltages and amperages, and verify that all circuits are free from faults.
3. Verify integrity/safety of all electrical connections.
4. Verify that shielded cables are grounded only at one end.
5. Verify that all sensor locations are as indicated on drawings and are away from causes of erratic operation.
6. Ensure that minimum speed settings programmed into variable speed drive are at or below the minimum speed settings in control sequences.

B. Digital Outputs

1. Verify that all digital output devices (relays, solenoid valves, two-position actuators and control valves, magnetic starters, etc.) operate properly and that the normal positions are correct.

C. Digital Inputs

1. Adjust setpoints, where applicable.

a. For current switches used as status on fans, adjust current setpoint so that fan status is

"off" when fan discharge damper (if present) is fully closed and when belt is broken (temporarily remove belt).

b. For current switches used as status on pumps, adjust current setpoint so that pump status is "off" when pump is dead-headed (temporarily close discharge valve).

c. For differential pressure sensors on pumps and fans, set so that status is on when pump operating with all valves open (out on its curve).

D. Analog Outputs

1. Verify start and span are correct and control action is correct.
2. Check all control valves and automatic dampers to ensure proper action and closure. Make any necessary adjustments to valve stem and damper blade travel.
3. Check all normal positions of actuators with spring return.
4. For outputs to reset other manufacturer's devices (for example, chiller setpoint) and for feedback from them, calibrate ranges to establish proper parameters.

E. Analog Input Calibration

1. Sensors shall be calibrated as specified on the points list. Calibration methods shall be one of the following:

   a. Factory. Calibration by factory, to standard factory specifications. Field calibration is not required.
   b. Handheld. Field calibrate using a handheld device with accuracy meeting the requirements of Paragraph 2.1.
   c. Drywell Bath. Field calibrate using a 2-point procedure, using a drywell calibrator block constructed for that purpose, or an ice bath with a reference standard.

2. The calibrating parameters in software (e.g. slope and intercept) shall be adjusted as required. A calibration log shall be kept and initialed by the technician showing date and time, sensor and hand-held readings, and calibration constant adjustments and included in the Pre-functional Test Report.

3. Inaccurate sensors must be replaced if calibration is not possible.

F. Alarms and Interlocks:

1. A log shall be kept and initialed by the technician showing date and time, alarm/interlock description, action taken to initiate the alarm/interlock, and resulting action, and included in the Pre-functional Test Report.
2. Check each alarm separately by including an appropriate signal at a value that will trip the alarm.
3. Coordinate with Division 26 to test fire and life safety systems alarm contacts.
4. Interlocks shall be tripped using field contacts to check the logic, as well as to ensure that the fail-safe condition for all actuators is in the proper direction.
5. Interlock actions shall be tested by simulating alarm conditions to check the initiating value of the variable and interlock action.

G. Variable Frequency Drive Minimum Speed

1. Minimum speed for VFD-driven fans and pumps shall be determined in accordance with this Paragraph. Tests shall be done for each piece of equipment, except that for multiple pieces of identical equipment used for identical applications, only one piece of equipment need be tested with results applied to all. Note that for fans and pumps, there is no minimum speed required for motor cooling. Power drops with cube of speed, causing motor losses to be

minimal at low speeds.

2. The work shall be done only after fan/pump system is fully installed and operational.
3. Determine the minimum speed setpoint as follows:

    a. Start the fan or pump.
    b. Manually set speed to 6 Hz (10%) unless otherwise indicated in control sequences. For cooling towers with gear boxes, use 20% or whatever minimum speed is recommended by tower manufacturer.
    c. Observe fan/pump in field to ensure it is visibly rotating.

        1) If not, gradually increase speed until it is.

    d. The speed at this point shall be the minimum speed setpoint for this piece of equipment.
    e. Record minimum speeds in log and store in software point as indicated in Section 23 09 29.

H. Tuning

1. Tune all control loops to obtain the fastest stable response without hunting, offset or overshoot. Record tuning parameters and response test results for each control loop in the Pre-functional Test Report. Except from a startup, maximum allowable variance from set point for controlled variables under normal load fluctuations shall be as follows. Within 3 minutes of any upset (for which the system has the capability to respond) in the control loop, tolerances shall be maintained (exceptions noted):

Controlled Variable	Control Accuracy
Duct Pressure	±0.1" w.g.
Building and relief plenum	±0.01" w.g.
Airflow and waterflow	±10%
Space Temperature	±1.5ºF
Chilled Water Temperature	±1ºF
Hot Water Temperature	±3ºF
Duct Temperature	±2ºF
Water Differential Pressure	±1.5 psi
Others	±2 times reported accuracy

I. Interface and Control Panels:

1. Ensure devices are properly installed with adequate clearance for maintenance and with clear labels in accordance with the Record Drawings.
2. Ensure that terminations are safe, secure and labeled in accordance with the Record Drawings.
3. Check power supplies for proper voltage ranges and loading.
4. Ensure that wiring and tubing are run in a neat and workman-like manner, either bound or enclosed in trough.
5. Check for adequate signal strength on communication networks.
6. Check for standalone performance of controllers by disconnecting the controller from the LAN. Verify the event is annunciated at Operator Interfaces. Verify that the controlling LAN reconfigures as specified in the event of a LAN disconnection.
7. Ensure that buffered and/or volatile information is held through power outage.
8. With all system and communications operating normally, sample and record update/annunciation times for critical alarms fed from the panel to the Operator Interface.

9. Check for adequate grounding of all DDC panels and devices.

J. Operator Interfaces:

1. Verify that all elements on the graphics are functional and are properly bound to physical devices and/or virtual points, and that hot links or page jumps are functional and logical.
2. Verify that the alarm printing, logging, paging, emailing etc. is functional and per requirements.

K. Trending/Network Traffic Test. Perform this test to verify that system has been design adequately to simultaneously capture trends and allow proper operation of the control system.

1. The test shall be performed after the verification trends (see paragraph 3.5A) have been set up and are operational.
2. Test 1:

a. Randomly select a device whose failure will generate a Level 1 or 2 alarm and manually shut it off. The status points for the device must indicate the change of state of the device at the Operator Workstation within 5 seconds.
b. The test shall be repeated for four devices in each building.

3. Test 2:

a. A clock signal from a field controller randomly selected will be sent as a programmable point to up to 3 BCs. The clock signal stored in BCs shall be sampled with the rest of the trend data. The system shall be considered acceptable if these clock signals are no more than 2 seconds off of the system clock as sampled concurrently during data collection.

4. If the system fails any test, the system architecture shall be revised as required (e.g. more trend memory, more controllers with trend storage capability, network repeaters to allow an increase in network speed, etc.) followed by additional tests.

3.2 TESTING, ADJUSTING, AND BALANCING (TAB) COORDINATION

A. Coordinate with Work performed under Section 23 05 93 Testing, Adjusting, and Balancing. Some balancing procedures require the EMCS to be operational and require Contractor time and assistance.

B. Calibration Software

1. Software shall be provided free of charge on at least a temporary basis to allow calibration of terminal box airflow controls and other Work specified under Section 23 05 93 Testing, Adjusting and Balancing.
2. Software shall be provided for installation on POT(s) provided by Others or Contractor shall loan a POT or handheld device with software installed for the duration of Work specified under Section 23 05 93 Testing, Adjusting, and Balancing.
3. Provide sufficient training to those performing Work specified under Section 23 05 93 Testing, Adjusting, and Balancing to allow them to use the software for balancing and airflow calibration purposes. Contractor shall include a single training session for this purpose.

C. Setpoint Determination

1. Perform pre-functional tests described in Section 23 09 29 before assisting in setpoint

determination.

2. Coordinate with Work performed under Section 23 05 93 Testing, Adjusting, and Balancing to determine fan and pump differential pressure setpoints, outdoor air damper minimum positions and DP setpoints, etc. as indicated in Section 23 05 93 Testing, Adjusting and Balancing.

D. Coil Valve Leak Check

1. Coordinate test procedures with those outlined in Section 23 05 93 Testing, Adjusting and Balancing to provide control valve leak check tests.
2. Test conditions for each hydronic system:

a. Tests shall be done when central plant cooling and heating systems are operational.
b. Close all control valves
c. Start all fans associated with control valves
d. Open bridge connection control valve.
e. Start both pumps.
f. Observe flow meter. If reading changes after pumps start, there is a leaking valve.
g. Observe supply air temperature at each coil after test starts.
h. Should any supply air temperature rise, close the isolation valves to the coil to see if temperature changes. If so, this validates the valve is not fully closing.
i. Remedy the condition by adjusting the stroke and range, increasing the actuator size/torque, replacing the seat, or replacing the valve as applicable.

3.3 FUNCTIONAL TESTS

A. Test schedule shall be coordinated with the Commissioning Authority, Commissioning Coordinator and/or Professional.

B. Functional tests may be witnessed by the Professional at the Using Agency's option.

C. All approved Functional Tests shall be conducted by the Contractor with results confirmed and signed by the Contractor's start-up technician.

1. Seasonal Impacts: It shall be assumed that not all tests will be possible due to weather conditions. Those that are not possible shall be deferred until the next season, performed during the warranty period.

D. Test documentation shall be submitted to the Using Agency for review and approval.

3.4 DEMONSTRATION TEST

A. Demonstration tests consist of a small representative sample of functional tests and systems randomly selected by the Using Agency. Tests will be designed to occur over no longer than ***2*** days.

B. Schedule the demonstration with the Professional 1 week in advance. Demonstration shall not be scheduled until the Functional Test Report has been approved.

C. The Contractor shall supply all personnel and equipment for the demonstration, including, but not limited to, instruments, ladders, etc. Contractor-supplied personnel shall be those who conducted the Functional tests or who are otherwise competent with and knowledgeable of all project-specific hardware, software, and the HVAC systems.

D. The system will be demonstrated following procedures that are the same or similar to those used in the Pre-Functional and Functional Tests. The Professional will supply the test forms at the site at the start of the tests.

E. Demonstration tests may be witnessed by the Professional at the Using Agency's option.

F. Contractor shall conduct tests as directed by and in the presence of the Professional and complete test forms. Completed forms shall be submitted as the Demonstration Test Report to the Using Agency and Commissioning Coordinator after tests are complete.

G. Demonstration Tests shall be successfully completed and approved prior to Substantial Completion.

3.5 TREND LOG TESTS

A. Trends shall be fully configured to record and store data to the OWS or server for the points and at the interval listed in Section 23 09 29 as follows:

1. Commissioning: Configure trends prior to functional testing phase. Retain configuration until post-construction trend review has been completed successfully and accepted by the Professional. Trends shall be deactivated after acceptance.
2. Continuous: After system acceptance, configure trends for the purpose of long term future diagnostics. Configure trends to overwrite the oldest trends at the longest interval possible without filling the server hard disk beyond 80%.

B. Commissioning (Post Construction) Trend Test

1. Trend logging shall not commence until Demonstration Tests are successfully completed.
2. Hardware Points: Contractor shall configure points to trend as indicated in the Commissioning Trend column listed in Section 23 09 26 points list with the following qualifications.

    a. For equipment of identical function, such as VAV zones and AHUs with identical components and control sequences, only a sample of such equipment need be trended. The sampling shall be 10% of the identical components, but no more than 10 and no less than three. Review with Professional before setting up trends.
    b. All points trended for one HVAC subsystem (e.g. air handling unit, chilled water system, etc.) shall be trended during the same trend period and the same time intervals so that data may be easily plotted using a spreadsheet.

3. Software Points: Include the following in trends of systems and zones whose hardware points are being trended as called for above. Time interval shall be the same as associated hardware point.

    a. All setpoints and limits that are automatically reset, such as supply air temperature and fan static pressure setpoints, plus the points that are driving the reset, such as zone level cooling and static pressure requrests.
    b. All setpoints that are adjustable by occupants
    c. Outputs of all control loops, other than those driving a single AO point that is already being trended.
    d. System mode points (e.g. Warm-up, Occupied, etc.)
    e. Global overrides such as demand shed signals.

f. Calculated performance monitoring points, such as chiller efficiency

4. Submit for review and approval by the Commissioning Authority and/or Professional a table of points to be trended along with trend intervals or change-of-value a minimum of 14 days prior to trend collection period.
5. Trends shall be uploaded to the OWS or Server in data format dspecified in Section 23 09 26.
6. Trend logs of all points indicated above shall be collected for a 3 week Trend Period.
7. At the completion of the Trend Period, data shall be reviewed by the Contractor to ensure that the system is operating properly. If so, data shall be submitted to the Professional in an electronic format agreed to by the Using Agency and Contractor (e.g. CD-ROM or via direct access to the OWS or server via the internet).
8. Data will be analyzed over approximately a two- to three-week period by the Commissioning Authority and/or Professional.
9. The system shall be accepted only if the trend review indicates proper system operation without malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications. If any but very minor glitches are indicated in the trends, steps 4 to 6 above shall be repeated for the same Trend Period until there is a complete Trend Period of error free operation.

C. Post Occupancy Trend Tests

1. After successfully completing the Commissioning Trend Tests, the Contractor shall configure all points to trend as indicated in the Continuous Trend column listed in Section 23 09 29 points list.
2. Archive trends up to the OWS or server without overwriting stored data for the entire Warranty Period.
3. The system shall be accepted and warranty period considered complete only if the trend review indicates proper operation without malfunction without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications. If any but very minor glitches are indicated in the trends, steps 3.5.6 to 3.5.8 above shall be repeated until there is a complete Trend Period of error free operation.

3.6 REMEDIAL WORK

A. Repair or replace defective Work, as directed by Professional in writing, at no additional cost to the Using Agency.

B. Restore or replace damaged Work due to tests as directed by Professional in writing, at no additional cost to the Using Agency.

C. Restore or replace damaged Work of others, due to tests, as directed by Professional in writing, at no additional cost to the Using Agency.

D. Remedial work identified by site reviews, review of submittals, demonstration test, trend reviews, etc. shall be performed to the satisfaction of the Professional, at no additional cost to the Using Agency.

E. Contractor shall compensate Professional and Commissioning Authority on a time and material basis at standard billing rates for any additional time required to witness additional demonstration tests or to review additional EMCS trends beyond the initial tests, at no additional cost to the Using Agency.

3.7 TRAINING

A. Coordinate schedule and materials with Professional and/or Commissioning Authority.

B. Interim Training

1. Provide minimal training so the operating staff can respond to occupant needs and other operating requirements during start-up and commissioning phase.

C. Formal Training.

2. Provide training sessions at locations and for personnel indicated in § 3.7G.
3. Training shall be conducted after all commissioning is complete and systems are fully operational.
4. The length of each training period will depend on the complexity of the system and the audience, described below. Minimum training shall be as listed below, but period shall be longer if required to complete the training tasks described below.

    a. On site job training: Include 40 hours total of on-site training to assist personnel in becoming familiar with site-specific issues, systems, control sequences, etc. (including general EMCS system training).

5. Training may be in non-contiguous days at the request of the Using Agency.
6. Contractor shall be video training sessions, see Section 23 00 10 Mechanical General Provisions.
7. During the warranty period, provide unlimited telephone support for all trained operators.

D. Operators are divided into three categories and shall receive training including but not limited to the tasks listed.

1. Day-to-day Operators shall be trained to:

    a. Proficiently operate the system
    b. Understand control system architecture and configuration
    c. Understand EMCS system components
    d. Understand system operation and control sequences
    e. Operate the workstation and peripherals
    f. Log on and off the system
    g. Access graphics, point reports, and logs
    h. Adjust and change system set points, time schedules, and holiday schedules
    i. Recognize malfunctions of the system by observation of the printed copy and graphical visual signals
    j. Understand and acknowledge alarms
    k. Understand system drawings, and Operation and Maintenance manual
    l. Understand the Project layout and location of control components
    m. Print point and predefined reports

2. Advanced Operators shall be trained to do all items for Day-to-day operators plus:

    a. Make and change graphics on the workstation
    b. Create, delete, and modify alarms, including annunciation and routing
    c. Create, delete, and modify point trend logs, and graph or print these both on an ad-hoc basis and at user-definable time intervals
    d. Create, delete, and modify reports
    e. Add, remove, and modify system’s physical points

f. Create, modify, and delete programming
g. Add control panels
h. Add Operator Workstations
i. Create, delete, and modify system displays — both graphical and otherwise
j. Perform EMCS system field checkout procedures
k. Perform EMCS controller unit operation and maintenance procedures
l. Perform workstation and peripheral operation and maintenance procedures
m. Perform EMCS system diagnostic procedures
n. Configure hardware including PC boards, switches, communication, and I/O points
o. Maintain, calibrate, troubleshoot, diagnose, and repair hardware
p. Adjust, calibrate, and replace system components
q. Maintain software and prepare backups

3. System Managers/Administrators shall be trained to do all items for Day-to-day operators plus:

a. Maintain software and prepare backups
b. Create and print custom reports, including tenant billing summaries.
c. Interface with job-specific, third-party operator software
d. Add new users and understand password security procedures

E. Training materials shall include step-by-step instructions (including illustrations, screen captures, etc.) for how to perform all task identified in herein such that a new Operator, who has not attended the training in person and has minimal familiarity with this EMCS system, can easily follow the instructions and successfully perform all of the identified tasks. One copy of training material shall be provided per student. An electronic copy of the materials shall be stored on the OWS.

F. The instructor(s) shall be factory-trained instructors experienced in presenting this material.

G. The type and number of personnel and location for training shall include.

a. Day-to-day Operator: 2
b. Advanced Operator: 1
c. System Managers/Administrators: 1

END OF SECTION 23 09 33

SECTION 23 11 00 - FUEL GAS PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. This Section includes fuel gas piping, specialties and accessories within the building.

1.3 PROJECT CONDITIONS

A. Site Gas System Pressure: 50 psig (CONTRACTOR SHALL VERIFY)

B. Building Gas System Pressure: Primary pressure is 5 psig reduced to secondary pressure of 8 Inch of Water Column. (CONTRACTOR SHALL VERIFY)

1.4 RELATED WORK AND REQUIREMENTS

A. Section 01 91 00 – Commissioning

B. Section 23 21 14 – Piping Specialties, for pressure gages

C. Section 22 13 19 – Plumbing Specialties

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Piping (below ground and above ground	R			R
Valves, all types	R			R
Meters	R	R		R
Pressure regulators	R			R

Specialties	R	R		R

C. Field quality-control test reports. Indicate an interpret test results for compliance with performance requirements.

1.6 QUALITY ASSURANCE

A. FM Standard: Provide components listed in FM's Fire Protection Approval Guide if specified to be FM approved.

B. IAS Standard: Provide components listed in IAS's Directory of AGA and CGA Certified Appliances and Accessories if specified to be IAS listed.

C. UL Standard: Provide component listed in UL's Gas and Oil Equipment Directory if specified to be UL listed.

D. ANSI Standard: Comply with ANSI Z223.1 and NFPA 54 (2009 Edition), "National Fuel Gas Code."

1.7 COORDINATION

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Using Agency or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Using Agency not less than seven days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Professional's written permission.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Appliance Connector Valves

a. Conbraco Industries, Inc.: Apollo Div.
b. Mueller Co.: Mueller Gas Products Div.
c. Watts Industries, Inc.: Water Products Div.
d. Brass Craft Manufacturing Co.
e. American Valve.

2. Gas Valves, NPS 2 and Smaller

a. Nibco, Inc.
b. Flow Control Equipment, Inc.
c. Grinnell Corp.
d. Honeywell, Inc. Co.
e. Crane Valves.

f. McDonald: A.Y. McDonald Mfg. Co.
g. Milwaukee Valve Co., Inc.
h. Mueller Co.: Mueller Gas Products Div.
i. Watts Industries, Inc.: Water Products Div.

3. Plug Valves, NPS 2-1/2 and Larger

a. Walworth Co.
b. Olson Technologies, Inc.; Homestead Valve Div.
c. Milliken Valve Co., Inc.

4. Service Meters: As approved by the Utility Provider or Using Agency
5. Line Pressure Regulators

a. American Meter Co.
b. Equimeter, Inc.
c. Fisher Controls International, Inc.
d. Schlumberger Industries: Gas Div.

6. Appliance Pressure Regulators

a. Eaton Corp.: Controls Div.
b. Harper Wyman Co.
c. Maxitrol Co.

2.2 PIPING MATERIALS

A. Steel Pipe: ASTM A 53; Type E or S; Grade B (Grade A for pipe 1-1/2 inch and smaller) Schedule 40; black.

1. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern, with threaded ends according to ASME B1.20.1.
2. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends according to ASME B1.20.1.
3. Cast-Iron Flanges and Flanged Fittings: ASME B16.1, Class 125.
4. Steel Welding Fittings: ASME B16.9, wrought steel or ASME B16.11, forged steel.
5. Steel Threaded Fittings: ASME B16.11, forged steel with threaded ends according to ASME B1.20.1.
6. Joint Compound and Tape: Suitable for natural gas.
7. Steel Flanges and Flanged Fittings: ASME B16.5.
8. Gasket Material: Thickness, material, and type suitable for natural gas.

B. Polyethylene Pipe: All polyethylene pipe used in the Project must comply with ASTM D-2513 and be manufactured in the United States

1. Pipe and Fitting Material. All pipes shall conform to the requirements of the currently approved ASTM D-25 13 specification “Thermoplastic Gas Pressure Pipe, Tubing and Fittings.” All fittings shall conform to the requirements of ASTM D-2683 specification “Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe” or ASTM D3261 “Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing.” All pipes shall be manufactured of virgin material, with the exception of the clean rework material that is generated from the manufacturer’s own production, as long as the pipe and/or fittings meet the required specifications. All pipe formulation must have suitable outdoor weather resistance. The color of all polyethylene

pipes shall be either orange or yellow.

2. Pipe Design. All pipe shall be designed for direct burial as specified in D.O.T. Title 49, Part 192, “Transportation of Natural and Other Gas By Pipeline: Minimum Federal Safety Standards,” through current Amendment, for natural gas mains and services operated at 60p.s.i.g. Orless. The pipe must also be suitable for replacing old steel mains and services. The pipe must be homogeneous and be free of holes, cracks, foreign material, blisters or other deleterious faults. The minimum design stress must comply with the requirements of ASTMD-2513.
3. Any defect such as a groove, notch, or gouge, greater than ten percent (10%) of the wall thickness of the pipe, shall not be used

C. Transition Fittings: Type, material, and end connections to match piping being joined.

D. Common Joining Materials: Refer to Section 23 05 00 Basic Plumbing Materials and Methods for joining materials not in this Section.

2.3 PIPING SPECIALTIES

A. Flexible Connectors: ANSI Z21.24, copper alloy.

B. Quick-Disconnect Devices: ANSI Z21.41, convenience outlets and matching plug connector.

2.4 SPECIALTIES VALVES

A. Valves, NPS 2 and Smaller: Threaded ends according to ASME B1.20.1 for pipe threads.

B. Valves, NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.

C. Appliance Connector Valves: ANSI Z21.15 and IAS listed.

D. Gas Stops: Bronze body with AGA stamp, plug type with bronze plug and flat or square head, ball type with chrome-plated brass ball and lever handle, or butterfly valve with stainless-steel disc and fluorocarbon elastomer seal and lever handle; 2-psig minimum pressure rating.

E. Gas Valves, NPS 2 and Smaller: ASME B16.33 and IAS-listed bronze body and 125-psig pressure rating.

1. Tamperproof Feature: Include design for locking.

F. Plug Valves, NPS 2-1/2 and Larger: ASME B16.38 and MSS SP-78 cast-iron, lubricated plug valves, with 125-psig pressure rating.

1. Tamperproof Feature: Include design for locking.

G. Automatic Gas Valves: ANSI Z21.21, with electrical operator for actuation by appliance automatic shutoff device.

2.5 GAS REGULATORS

A. Description: Single stage and suitable for fuel gas service. Include steel jacket and corrosion-resistant components, elevation compensator, and atmospheric vent.

1. NPS 2 and Smaller: Threaded ends according to ASME B1.20.1 for pipe threads.
2. NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.
3. Line Pressure Regulators: ANSI Z21.80.
4. Appliance Pressure Regulators: ANSI Z21.18. Regulator may include vent limiting device, instead of vent connection, if approved by Professional

B. Pressure Regulator Vents: Factory- or field-installed, corrosion-resistant screen in opening if not connected to vent piping.

2.6 METERS

A. Natural gas meter: Provide outside adjacent to mechanical room entrance, a meter for the Using Agency's use in determining the gas usage for this building. Meter shall be pipe or pedestal mounted, rotary style, enamel coated steel case. Provide combined register totalizer, water escape hole in housing and means for sealing against tampering. Provide with a pulse sensor so the building meter reading system can connect to the gas meter.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Refer to Division 22 - Excavation Backfill and Compaction for Utilities

B. Refer to Division 31 – Earthwork and Grading

C. Refer to Division 31 – Trenching, Backfilling and Compacting

3.2 INSTALLATION

A. Coordinate with Work of other trades

B. See Section 23 08 00 – Mechanical Commissioning

3.3 PREPARATION.

A. Close equipment shutoff fuel gas to premises or section of piping. Perform leakage test as specified in Article entitled, Field Quality Control, to determine that all equipment is turned off in affected piping section.

B. Comply with ANSI Z223.1, paragraph entitled, Prevention of Accidental Ignition.

3.4 SERVICE ENTRANCE PIPING

A. Extend fuel gas piping and connect to fuel gas distribution for service entrance to building.

B. Install dielectric fitting downstream from and adjacent to each service meter unless meter is supported from service-meter bar with integral dielectric fitting. Install shutoff valve downstream

from and adjacent to dielectric fitting. Refer to Section 23 05 00 – Basic Mechanical Materials and Methods for dielectric fittings.

3.5 PIPING APPLICATIONS

A. Flanges, unions, transitions and special fittings with pressure ratings same as or higher than system pressure rating may be used in applications below, provided compliance with the IPC is maintained.

B. Fuel Gas Piping above ground: Use the following:

1. NPS 2 and Smaller: Steel pipe, malleable-iron threaded fittings, and threaded joints.
2. NPS 2-1/2 and Larger: Steel pipe, steel welding fittings, and welded joints.

C. Fuel Gas Piping below ground:

1. Thermoplastic gas pressure pipe, tubing and fittings, ASTM D2513 with transition riser.

3.6 VALVE APPLICATIONS

A. Appliance Shutoff Valves for Pressure 0.5 psig or Less.: Appliance connector valve or gas stop.

B. Appliance Shutoff Valves for Pressure 0.5 to 2 psig: Gas stop or gas valve

C. Appliance Shutoff Valves for Pressure 2 to 5 psig: Gas valve

D. Piping Line Valves, NPS 2 and Smaller: Gas valve.

E. Piping Line Valves, NPS 2-1/2 and Larger: Plug valve or general-duty valve.

3.7 PIPING INSTALLATION

A. Refer to Section 23 05 00 - Basic Mechanical Materials and Methods for basic piping installation requirements and piping joint construction.

B. Install regulator assemblies aboveground. Include gas valve or plug valve for each assembly.

1. Install gas valve or plug valve and strainer upstream from each service pressure regulator.
2. Install service pressure regulators with vent outlet turned down and with corrosion-resistant-metal insect screen.

C. Service Entrance Piping: Extend fuel gas piping and connect to fuel gas distribution for service entrance to building.

1. Exterior service meter will be provided by gas utility.

D. Concealed Locations: Except as specified below, install concealed gas piping in airtight conduit constructed of Schedule 40, seamless, black steel pipe with welded joints. Vent conduit to outside and terminate with screened vent cap.

1. Above-Ceiling Locations: Gas piping may be installed in accessible spaces, subject to

approval of authorities having jurisdiction, whether or not such spaces are used as plenums. Do not locate valves above ceilings.

2. In Partitions: Do not install concealed piping in solid partitions. Protect tubing from physical damage when installed inside partitions or hollow walls.
3. In Walls: Gas piping with welded joints and protective wrapping specified in "Protective Coating" Article in Part 2 may be installed in walls, subject to approval of authorities having jurisdiction.
4. Prohibited Locations: Do not install gas piping in or through circulating air ducts, chimneys or gas vents (flues), ventilating ducts, or elevator shafts.

    a. Exception: Accessible above-ceiling space specified above.

E. Drips and Sediment Traps: Install drips at points where condensate may collect. Include outlets of service meters. Locate where readily accessible for cleaning and emptying. Do not install where condensate would be subject to freezing.

1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use minimum-length nipple of 3 pipe diameters, but not less than 3 inches long, and same size as connected pipe. Install with space between bottom of drip and floor for removal of plug or cap.

F. Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings and in floor channels, unless indicated to be exposed to view.

G. Install fuel gas piping at uniform grade of 0.1 percent slope upward toward risers.

H. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

I. Connect branch piping from top or side of horizontal piping.

J. Install unions in pipes NPS 2 and smaller, adjacent to each valve, at final connection to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.

K. Installed corrugated, stainless-steel tubing system according to manufacturer’s written instructions. Include striker plates to protect tubing from puncture where tubing is restrained and cannot move.

L. Install strainer on inlet of each line pressure regulator and automatic and electrically operated valve.

M. Install pressure gage upstream and downstream from each line pressure regulator.

N. Install flanges on valves, specialties, and equipment having NPS 2-1/2 and larger connections.

O. Install vent piping for gas pressure regulators and gas trains, extend outside building, and vent to atmosphere. Terminate vents with turned-down, reducing-elbow fittings with corrosion-resistant insect screens in large end.

P. Purging Pipes and Fittings: A combustible gas indicator shall be used when purging mains and piping. When purging gas from abandoned lines, the air and the gas must be discharged aboveground and directed away from power lines or structures. When purging air from new

lines, installation of a 3/4 service saddle and non-corrodible riser is required four (4) feet from each deadend on all new installations of pipe in order to purge air from all deadends simultaneously. Release gas into new lines at a rate that will prevent formation of a hazardous mixture of gas and air or precede natural gas with a slug of inert gas.

Q. Pipe Placement and Backfill.

1. When installing polyethylene pipe, sufficient slack shall be provided to allow for possible contraction. The polyethylene pipe shall not have a bend that is less than 25 times the outside diameter of the pipe. If a bend is required that is less than 25 times the outside diameter of the pipe, then an approved polyethylene elbow fitting is required. A fusion joint shall not be placed at a bend. During extremely high temperature conditions it may be necessary to cool the pipe before the last connection.
2. No polyethylene gas line shall be installed above ground. During maintenance, repair, and tie-in work, temporary polyethylene gas lines may be used above ground.
3. The minimum clearance required between the distribution piping and other underground structures is twelve (12) inches. Trench width and minimum cover shall comply with another Section of specification, Excavation, Trenching and Backfilling for Utilities. Unless otherwise shown on plans, pipe embedment shall be select material and remainder of trench may be backfilled with spoil from trenching operation.

3.8 VALVE AND VALVE BOXES

A. Provide valves and valve boxes plumb. All boxes shall be installed flush with the finished grade. Support box with brick or other approved material. Adequate backfill shall be placed around the valve boxes and valve extension boxes to prevent any damage or settlement to the pipeline that may be transferred to the pipe through the valve box. Protective sleeves shall be installed over fusion joints and extend through the valve boxes on the polyethylene valve installations.

3.9 HANGERS AND SUPPORTS

A. Refer to Section 23 05 29 - Hangers and Supports for pipe hanger and support devices.

3.10 CONNECTIONS

A. Install piping adjacent to appliances to allow service and maintenance. Connect piping to appliances using gas with shutoff valves and unions. Install valve upstream from and within 72 inches of each appliance. Install union downstream from valve.

B. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance using gas.

C. Ground equipment

1. Tighten electrical connectors and terminals according to manufacturer’s published torque-tightening values. If manufacturer’s torque values are not indicated, use those specified in UL 486A and UL 486B.
2. Do not use gas pipe as grounding electrode.

3.11 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each service meter, pressure regulator and specialty valve.

1. Text: In addition to name of identified unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
2. Refer to Section 23 05 53 – Mechanical System Identification for nameplates and signs.

3.12 PAINTING

A. Use materials and procedures in Division 09 – Painting

B. Paint exterior pipe, fittings, pressure regulators, specialty valves, etc.

1. Pipe and Fittings, Color: Yellow (Confirm color with Professional prior to painting)
2. Pressure Regulators, Specialty valves, Etc., Color: Red (Confirm color with Professional prior to painting)

C. Paint exposed interior pipe, fittings, pressure regulators, specialty valves, etc.

1. Pipe and Fittings, Color: Yellow (Confirm color with Professional prior to painting)
2. Pressure Regulators, Specialty valves, Etc., Color: Red (Confirm color with Professional prior to painting)

3.13 FIELD QUALITY CONTROL

A. Inspect, test, and purge piping according to ANSI Z223.1, Part 4 "Inspection, Testing, and Purging," and requirements of authorities having jurisdiction.

B. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.

C. Report test results promptly and in writing to Professional.

D. Verify capacities and pressure ratings of pressure regulators, valves and specialties.

E. Verify correct pressure settings for pressure regulators.

F. Verify that specified piping tests are complete

3.14 ADJUSTING

A. Adjust controls and safety devices. Replace damaged and malfunctioning controls and safety devices.

END OF SECTION 23 11 00

SECTION 23 23 00 - REFRIGERANT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Refrigerant system piping

B. Related Sections

1. Section 23 00 10 – Mechanical General Provisions
2. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. ANSI/ARI 495 – Refrigerant Liquid Receivers

B. ANSI/ARI 710 – Liquid Line Dryers

C. ANSI/ASHRAE 34 – Number Designation of Refrigerants

D. ANSI/ASTM B32 – Solder Metal

E. ANSI/ASTM B88 – Seamless Copper Water Tube

F. ASTM B280 – Seamless Copper Tube for Air Conditioning and Refrigeration Field Service

G. ANSI/AWS A5.8 – Brazing Filler Metal

H. ANSI/AWS D1.1 – Structural Welding Code

1.4 QUALITY ASSURANCE

A. Each length of pipe, fitting, trap, fixture or device used in any piping system shall be stamped or indelibly marked with

1. Weight or quality

2. Maker's name or mark

B. Examine piping layouts and determine requirements for piping offsets, loops or expansion joints to adequately protect systems.

1. Determine locations and design of anchors and pipe guides to maintain proper piping alignment.
2. Determine anchor reaction forces and coordinate locations of anchors with Contracting Officer.

C. Coordinate expansion and flexibility requirements of this Section with seismic bracing requirements of Section 23 05 48 – Mechanical Sound and Vibration Control.

D. Conform to ANSI/ASME B31.1

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Piping materials	R			R
Valves and specialties	R			R
Solder	R			

1.6 PERFORMANCE REQUIREMENTS

A. Line Test Pressure for Refrigerant R-410A

1. Suction Lines for Air-Conditioning Applications: 300 psig
2. Suction Lines for Heat-Pump Applications: 535 psig
3. Hot-Gas and Liquid Lines: 535 psig

PART 2 - PRODUCTS

2.1 COPPER TUBE AND FITTINGS

A. Copper Tube: ASTM B 280, Type ACR.

B. Wrought-Copper Fittings: ASME B16.22.

C. Wrought-Copper Unions: ASME B16.22.

D. Solder Filler Metals: ASTM B 32. Use 95-5 tin antimony or alloy HB solder to join copper socket fittings on copper pipe.

E. Brazing Filler Metals: AWS A5.8.

F. Flexible Connectors:

1. Body: Tin-bronze bellows with woven, flexible, tinned-bronze-wire-reinforced protective jacket.
2. End Connections: Socket ends.
3. Offset Performance: Capable of minimum 3/4-inch misalignment in minimum 7-inch- long assembly.
4. Pressure Rating: Factory test at minimum 500 psig.
5. Maximum Operating Temperature: 250 deg F.

2.2 VALVES AND SPECIALTIES

A. Service Valves:

1. Body: Forged brass with brass cap including key end to remove core.
2. Core: Removable ball-type check valve with stainless-steel spring.
3. Seat: Polytetrafluoroethylene.
4. End Connections: Copper spring.
5. Working Pressure Rating: 500 psig.

B. Solenoid Valves: Comply with ARI 760 and UL 429; listed and labeled by an NRTL.

1. Body and Bonnet: Plated steel.
2. Solenoid Tube, Plunger, Closing Spring, and Seat Orifice: Stainless steel.
3. Seat: Polytetrafluoroethylene.
4. End Connections: Threaded.
5. Electrical: Molded, watertight coil in NEMA 250 enclosure of type required by location with 1/2-inch (16-GRC) conduit adapter, and 24-V ac coil.
6. Working Pressure Rating: 400 psig.
7. Maximum Operating Temperature: 240 deg F
8. Manual operator.

C. Thermostatic Expansion Valves: Comply with ARI 750.

1. Body, Bonnet, and Seal Cap: Forged brass or steel.
2. Diaphragm, Piston, Closing Spring, and Seat Insert: Stainless steel.
3. Packing and Gaskets: Non-asbestos.
4. Capillary and Bulb: Copper tubing filled with refrigerant charge.
5. Suction Temperature: See DX Coil (AHU) Schedule.
6. Superheat: Adjustable.
7. Reverse-flow option (for heat-pump applications).
8. End Connections: Socket, flare, or threaded union.
9. Working Pressure Rating: 700 psig.

D. Moisture/Liquid Indicators:

1. Body: Forged brass.
2. Window: Replaceable, clear, fused glass window with indicating element protected by filter screen.
3. Indicator: Color coded to show moisture content in ppm.
4. Minimum Moisture Indicator Sensitivity: Indicate moisture above 60 ppm.
5. End Connections: Socket or flare.
6. Working Pressure Rating: 500 psig.
7. Maximum Operating Temperature: 240 deg F.

E. Replaceable-Core Filter Dryers: Comply with ARI 730.

1. Body and Cover: Painted-steel shell with ductile-iron cover, stainless-steel screws, and neoprene gaskets.
2. Filter Media: 10 micron, pleated with integral end rings; stainless-steel support.
3. Desiccant Media: Activated alumina.
4. End Connections: Socket.
5. Access Ports: NPS 1/4 connections at entering and leaving sides for pressure differential measurement.
6. Maximum Pressure Loss: 2 psig
7. Working Pressure Rating: 500 psig.
8. Maximum Operating Temperature: 240 deg F.

2.3 REFRIGERANTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Atofina Chemicals, Inc.
2. DuPont Company; Fluorochemicals Div.
3. Honeywell, Inc.; Genetron Refrigerants.

B. ASHRAE 34, R-410A: Pentafluoroethane/Difluoromethane.

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS FOR REFRIGERANT R-410A.

A. Suction Lines NPS 3-1/2 and Smaller for Conventional Air-Conditioning Applications: Copper, Type ACR, drawn-temper tubing and wrought-copper fittings with brazed or soldered joints.

B. Hot-Gas and Liquid Lines: Copper, Type ACR, annealed- or drawn-temper tubing and wrought-copper fittings with brazed or soldered.

3.2 VALVE AND SPECIALTY APPLICATIONS.

A. Install solenoid valves upstream from each expansion valve and hot-gas bypass valve. Install

solenoid valves in horizontal lines with coil at top.

B. Install thermostatic expansion valves as close as possible to distributors on evaporators.

1. Install valve so diaphragm case is warmer than bulb.
2. Secure bulb to clean, straight, horizontal section of suction line using two bulb straps. Do not mount bulb in a trap or at bottom of the line.
3. If external equalizer lines are required, make connection where it will reflect suction-line pressure at bulb location.

C. Install moisture/liquid indicators in liquid line at the inlet of the thermostatic expansion valve or at the inlet of the evaporator coil capillary.

D. Install filter dryers in liquid line between compressor and thermostatic expansion valve.

E. Install flexible connectors at condensing units.

3.3 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems; indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Shop Drawings.

B. Install refrigerant piping according to ASHRAE 15.

C. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping adjacent to machines to allow service and maintenance.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Select system components with pressure rating equal to or greater than system operating pressure.

J. Install piping as short and direct as possible, with a minimum number of joints, elbows, and fittings.

K. Arrange piping to allow inspection and service of refrigeration equipment. Install valves and specialties in accessible locations to allow for service and inspection. Install access doors or panels if valves or equipment requiring maintenance is concealed behind finished surfaces.

L. Install refrigerant piping in protective conduit where installed belowground.

M. Install refrigerant piping in rigid or flexible conduit in locations where exposed to mechanical injury.

N. Slope refrigerant piping as follows:

1. Install horizontal hot-gas discharge piping with a uniform slope downward away from compressor.
2. Install horizontal suction lines with a uniform slope downward to compressor.
3. Liquid lines may be installed level.

O. When brazing or soldering, remove solenoid-valve coils and sight glasses; also remove valve stems, seats, and packing, and accessible internal parts of refrigerant specialties. Do not apply heat near expansion-valve bulb.

P. Install piping with adequate clearance between pipe and adjacent walls and hangers or between pipes for insulation installation.

Q. Identify refrigerant piping and valves according to Section 23 05 53 – Mechanical System Identification.

R. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 23 05 00 – Basic Mechanical Materials and Methods.

S. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 23 05 00 – Basic Mechanical Materials and Methods.

T. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 23 05 00 – Basic Mechanical Materials and Methods.

3.4 PIPE JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Fill pipe and fittings with an inert gas (nitrogen or carbon dioxide), during brazing or soldering, to prevent scale formation.

D. Soldered Joints: Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook."

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube."

1. Use Type BcuP, copper-phosphorus alloy for joining copper socket fittings with copper pipe.
2. Use Type BAg, cadmium-free silver alloy for joining copper with bronze or steel.

3.5 HANGERS AND SUPPORTS

A. Hanger, support, and anchor products are specified in Section 23 05 29 Hangers and Supports.

B. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal runs less than 20 feet long.
2. Copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.

C. Install hangers for copper tubing with the following maximum spacing and minimum rod sizes:

1. NPS 1/2: Maximum span, 60 inches; minimum rod size, 1/4 inch.
2. NPS 5/8: Maximum span, 60 inches; minimum rod size, 1/4 inch .
3. NPS 1: Maximum span, 72 inches; minimum rod size, 1/4 inch.
4. NPS 1-1/4: Maximum span, 96 inches ; minimum rod size, 3/8 inch.
5. NPS 1-1/2: Maximum span, 96 inches; minimum rod size, 3/8 inch.
6. NPS 2: Maximum span, 96 inches; minimum rod size, 3/8 inch.
7. NPS 2-1/2: Maximum span, 108 inches; minimum rod size, 3/8 inch.

D. Support multifloor vertical runs at least at each floor.

3.6 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

B. Tests and Inspections:

1. Comply with ASME B31.5, Chapter VI.
2. Test refrigerant piping, specialties, and receivers. Isolate compressor, condenser, evaporator, and safety devices from test pressure if they are not rated above the test pressure.
3. Test high- and low-pressure side piping of each system separately at not less than the pressures indicated in Part 1 "Performance Requirements" Article.

    a. Fill system with dry nitrogen to the required test pressure.
    b. System shall maintain test pressure at the manifold gage throughout duration of test.
    c. Test joints and fittings with electronic leak detector or by brushing a small amount of soap and glycerin solution over joints.
    d. Remake leaking joints using new materials, and retest until satisfactory results are achieved.

3.7 SYSTEM CHARGING

A. Charge system using the following procedures:

1. Install core in filter dryers after leak test but before evacuation.
2. Evacuate entire refrigerant system with a vacuum pump to 500 micrometers. If vacuum

holds for 12 hours, system is ready for charging.
3. Break vacuum with refrigerant gas, allowing pressure to build up to 2 psig.
4. Charge system with a new filter-dryer core in charging line.

3.8 ADJUSTING

A. Adjust thermostatic expansion valve to obtain proper evaporator superheat.

B. Adjust high- and low-pressure switch settings to avoid short cycling in response to fluctuating suction pressure.

C. Adjust set-point temperature of air-conditioning or chilled-water controllers to the system design temperature.

D. Perform the following adjustments before operating the refrigeration system, according to manufacturer's written instructions:

1. Verify that compressor oil level is correct.
2. Open compressor suction and discharge valves.
3. Open refrigerant valves except bypass valves that are used for other purposes.

E. Replace core of replaceable filter dryer after system has been adjusted and after design flow rates and pressures are established.

END OF SECTION 23 23 00

SECTION 23 31 13 – DUCTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Ductwork
2. Plenums
3. Fasteners and Sealants
4. Boiler flues and breechings
5. Exceptions: Where integral with manufactured piece of equipment

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. SMACNA HVAC Duct Construction Standards, latest edition

1.4 DEFINITIONS

A. Seam: locks or weld applied longitudinally to close section of duct, for example longitudinal seam, spiral seam.

B. Joint: abutting connection between duct sections for continuity of air passage, for example cross joint, transverse joint, coupling.

C. Reinforcement: hardware applied to strengthen duct, for example girth angles, tie rods, fasteners (not connectors), and the like.

D. Stiffening: folding, bending, beading, crossbreaking or corrugating of sheets to achieve strength through shape, for example pocket lock secures joint and is transverse stiffener, with girth angle and fasteners applied (not connectors), joint or stiffener is reinforced.

E. Duct Classification

1. Velocity

    a. Low: to 2000 feet per minute
    b. High: above 2000 feet per minute

2. Pressure classification: except as indicated on the Drawings

    a. Low: to 2 inches water gage
    b. Medium: above 2 inches to 6 inches water gage. Default 3 inches if not otherwise indicated on the Drawings
    c. High: above 6 inches water gage

1.5 QUALITY ASSURANCE

A. Regulatory Requirements

1. Entire ductwork system, including materials and installation, installed in accordance with NFPA 90A
2. Ductwork and components shall be listed as U.L. 181, 181A and 181B, Class I air duct, flame rating not to exceed 25 and smoke rating not to exceed 50.
3. Flues shall conform to the requirements of NFPA-211. Products shall be listed to UL-103 and shall carry the appropriate UL listing mark or label.

1.6 QUALITY ASSURANCE

A. See Section 23 00 10 Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings according to the following table.

1. “R” means required
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Ductwork materials and fittings	R			R
Flexible ducts	R			R
Duct sealants	R			
Flue	R			R
Duct pressure testing reports		R		

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Spiral oval and round ducts

1. United Sheet Metal Division, United McGill
2. Semco Manufacturing, Inc.
3. Eastern Sheetmetal
4. Lindab, Inc.

C. Duct Connection Systems

1. Ductmate Industries, Inc.
2. Fabriduct Transverse Duct Connection system
3. Ward Industries, Inc.

D. Flexible Connections

1. Ventfabrics
2. Duro Dyne
3. Or equal

E. Flexible Ducts

1. Thermaflex
2. ATCO Rubber Products, Inc.
3. Hart & Cooley
4. Flexmaster

F. Duct Sealants

1. Minnesota Mining and Manufacturing Company
2. Foster Products Corporation
3. Miracle Adhesive Corporation
4. United Sheet Metal Division United McGill Corporation
5. Hardcast Corporation, Inc.
6. Mon Eco Industries
7. Nashua
8. 3M

G. Flexible Duct Clamps

1. Panduit
2. Dura Dyne
3. Ideal Division Parker Hannifin Corporation
4. Tridon Corporation
5. Young Regulator Company

H. Hi-Efficiency Branch Take-Off Fittings

1. Flexmaster
2. Crown
3. Sheet Metal Connectors
4. Or equal

I. Flue

1. Selkirk Metalbestos

2. Ampco
3. Metal-Fab, Inc.
4. American Metal Products Amerivent
5. Simpson Dura-Vent
6. Or equal

2.2 MATERIALS

A. Galvanized Steel Sheet Metal

1. Cold rolled soft steel sheets
2. ASTM A653 and A924
3. Galvanizing: 1-1/4 ounces per square foot, total both sides

    a. General: G-90
    b. Exposed to weather: G-90
    c. Plenum walls and blank-offs where in contact with cooling coil: G-90

4. Lock-forming quality

B. Stainless Steel Sheet Metal

1. ASTM A480
2. Type 304 unless otherwise specified herein
3. Lock-forming quality
4. Finish

    a. No. 3 or 4 finish on ducts exposed to occupant view
    b. No. 2B or 3 finish on concealed ducts.

C. Miscellaneous Products

1. Screws and rivets

    a. Same material as sheet, except as indicated on the Drawings
    b. On aluminum sheets, provide cadmium plated or stainless steel
    c. Zinc or cadmium plated, permitted on galvanized sheets
    d. Minimum screw size: No. 10
    e. Minimum rivet size: 4 pound

2. Duct Sealants

    a. Sealing compound: UL-181 approved, Safetee Duct Sealant 32-17, Foster Products Corporation, Design Polymerics DP-1010, or equal
    b. Tape: Nashua or equal, comply with UL 181B
    c. Gaskets

        (1) Continuous, reinforced, inert self-conforming type
        (2) 1/8 inch thick
        (3) Width: to match angle connection.
        (4) 3M Weatherban Ribbon Sealant PF5422 or equal

3. Hard-setting joint tape, two-part

a. Two part tape
b. Mineral impregnated woven fiber tape
c. Impregnated with activator/adhesive of polyvinyl acetate type
d. UL Listed
e. Flame spread: 10
f. Smoke contributed: 0
g. Equal to Hardcast RTA-50 sealant and DT-5400 4 inch tape

4. Spring Fasteners

a. Oval head stud and receptacle
b. Screwdriver slot
c. Self-ejecting
d. Dzus or equal

5. Angles, tie rod and shapes for reinforcing ducts: In accordance with SMACNA HVAC Duct Construction Standards, except as indicated on the Drawings
6. Duct connection system

a. Transverse bolted duct joints
b. Flanges with permanent, non-hardening sealant
c. Ductmate Industries Ductmate 25 and 35, Fabriduct TDC, or equal

D. Flexible Connections

1. Conforming to UL Standard No. 214 and NFPA 90A
2. SMACNA HVAC Duct Construction Standards, except as indicated on the Drawings
3. With metal edges at each end: No. 24 USSG galvanized steel
4. Length of fabric connections

a. Minimum: 4 inch
b. Maximum: 10 inch

5. Materials

a. Coated glass fabric
b. Flame spread rating: 25
c. Smoke development rating: 50
d. 30 ounces per sq yard
e. Sewed and cemented seams
f. Indoors

(1) Neoprene
(2) Ventfabrics, Inc. Ventglas or equal

g. Outdoors

(1) Weather-resistant
(2) Fiberglass with Hypalon
(3) UV, sunlight, and ozone resistant
(4) Ventfabrics, Inc. Ventlon or equal

h. Fume Hood

(1) Fabric coated with Teflon fluorocarbon resins

(2) Meets UL Standard #214 for flammability and NFPA 102 requirements
(3) Ventfabrics, Inc. Ventel or equal

E. Turning vanes

1. Galvanized steel ductwork: galvanized steel or painted black steel, except as indicated on the Drawings
2. Other ductwork: same material as ductwork
3. Construction per SMACNA HVAC Duct Construction Standards for

   a. Single wall vanes with 3/4 inch trailing edge
   b. Double wall vanes: Not acceptable
   c. Vane length: Provide separate equal size sections for vane length greater than those indicated in referenced Standards.
   d. Vane runners: Type 1 or 2 acceptable

4. Vane radius

   a. 2 inch radius: duct width up to 36 inches
   b. 4-1/2 inch radius: duct with 36 inches or larger

5. Vane shall be at the correct angle for airflow (leading edge in line with the entering duct section; leaving edge in line with existing duct section). If only 45° angles are available, turning vanes shall only be used in 90° elbows where the entering width equals the exiting width; all other elbows shall be full radius type unless otherwise indicated on the drawings.

F. Low pressure round duct take-off fittings in rectangular duct

1. Factory-fabricated hi-efficiency take-off fitting
2. 26 gauge body, G90 galvanized steel
3. 1” wide mounting flange with fully closed corners and pre-punched screw holes, adhesive coated gasket on flange.
4. Balancing damper

   a. 20 gauge blade
   b. G90 galvanized steel 3/8” square control shaft.
   c. Nylon shaft bearings/bushings
   d. 2” high insulation stand-off
   e. Duro Dyne KR-3 Locking hand quadrant or equal

5. No scoop allowed for any application
6. Flexmaster STOD or equal

2.3 RECTANGULAR DUCT

A. General: Fabricate ducts, elbows, transitions, offsets, branch connections, and other construction with galvanized sheet metal, according to SMACNA’s “HVAC Duct Construction Standards – Metal and Flexible.” Comply with requirements for metal thickness, reinforcing types and intervals, tie-rod applications, and joint types and intervals.

1. Lengths: Fabricate rectangular ducts in lengths appropriate to reinforcement and rigidity class required for pressure classification.
2. Materials: free from visual imperfections such as pitting, seam marks, roller marks, stains, and discolorations.

B. Cross Breaking or Cross Beading: Cross break or cross bead duct sides 19 inches and larger and 0.0359 inches thick or less, with more than 10 square feet of unbraced panel area, unless ducts are lined.

2.4 ROUND AND OVAL DUCTWORK

A. General

1. Factory-fabricated spiral lock seam duct

a. Snap lock is not acceptable
b. Factory-fabricated longitudinal seam acceptable for ducts larger than standard factory sizes
c. Ducts up to 20 Inches in Diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
d. Ducts 21 to 72 Inches in Diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
e. Ducts larger than 72 Inches in Diameter: Companion angle flanged joints per SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," Fig. 3-2.
f. Round Ducts: Prefabricated connection system consisting of double-lipped, EPDM rubber gasket. Manufacture ducts according to connection system manufacturer's tolerances.
g. Flat Oval Ducts: Prefabricated connection system consisting of two flanges and one synthetic rubber gasket.

2. Fittings

a. Same material and construction as duct in which installed
b. For ductwork exposed to occupant view, do not use fabricated fitting at taps to VAV boxes and outlets. Instead use saddle tap cut into continuous spiral duct. Intent is for spiral duct to be continuous for aesthetic reasons. Saddle tap flange shall be 0.5 inches or less.
c. 90 degree tees, laterals, and conical tees

(1) Fabricate to comply with SMACNA's "HVAC Duct Construction Standards – Metal and Flexible", with metal thicknesses specified for longitudinal-seam straight ducts.
(2) Center-line take-off, unless otherwise indicated on the Drawings

d. Elbows

(1) Seams

a) 4 inch and higher pressure class and all ducts exposed to occupant view: continuously welded seams
b) 1 inch to 3 inch pressure: spot welded with bonded (sealed) seams

(2) Gores

a) 2 gores - less than or equal to 30 degrees
b) 3 gores - 31 degrees through 45 degrees
c) 4 gores – 46 degrees through 60 degrees
d) 5 gores - over 61 degrees

2.5 ROUND AND FLAT OVAL DOUBLE WALL DUCT AND FITTINGS

A. Diameter as applied to flat-oval ducts in this Article is the diameter of a round duct with a circumference equal to the perimeter of a given size of flat-oval duct.

B. Round, Longitudinal- and Spiral Lock-Seam Ducts: Fabricate supply ducts of galvanized steel according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible." Ducts to have a perforated inner liner, a 1-inch layer of fiberglass insulation (1-1/2 pounds per cubic foot density) and an outer pressure cell.

1. Acceptable Manufacturers: Ductmate Industries, Inc.; Lindab Inc.; McGill Air Flow Corp.; SEMCO Inc.; Spiral Pipe of Texas, Inc.

C. Duct Joints:

1. Ducts up to 20 Inches in Diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
2. Ducts 21 to 72 Inches in Diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
3. Ducts larger than 72 Inches in Diameter: Companion angle flanged joints per SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," Fig. 3-2.
4. Round Ducts: Prefabricated connection system consisting of double-lipped, EPDM rubber gasket. Manufacture ducts according to connection system manufacturer's tolerances.

    a. Acceptable Manufacturers: Ductmate Industries, Inc.: Lindab Inc.: McGill Airflow Corp.: Spiral Pipe of Texas, Inc.

5. Flat Oval Ducts: Prefabricated connection system consisting of two flanges and one synthetic rubber gasket.

    a. Acceptable Manufacturers: Ductmate Industries, Inc.: Lindab Inc.: McGill Airflow Corp.: SEMCO Inc.; Spiral Pipe of Texas, Inc.

D. 90-Degree Tees and Laterals and Conical Tees: Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," with metal thicknesses specified for longitudinal-seam straight ducts. .

E. Diverging-Flow Fittings: Fabricate with reduced entrance to branch taps and with no excess material projecting from fitting onto branch tap entrance.

F. Fabricate elbows using die-formed, gored, pleated, or mitered construction. Unless elbow construction type is indicated, fabricate elbows as follows:

1. Mitered-Elbow Radius and Number of Pieces: Welded construction complying with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible."
2. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from minus 2- to plus 2-inch wg:

    a. Ducts 3 to 36 Inches in Diameter: 0.034 inch.
    b. Ducts 37 to 50 Inches in Diameter: 0.040 inch.
    c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
    d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.

3. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from 2- to 10-inch wg:

    a. Ducts 3 to 36 Inches in Diameter: 0.034 inch.
    b. Ducts 37 to 50 Inches in Diameter: 0.040 inch.
    c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
    d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.

4. Flat Oval Mitered Elbows: Welded construction with same metal thickness as longitudinal-seal flat oval duct.
5. Round Elbows 8 Inches and Less in Diameter: Fabricate die-formed elbows for 45- and 90-degree elbows and pleated elbows for 30, 45, 60, and 90 degrees only. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
6. Round Elbows 9 through 14 Inches in Diameter: Fabricate gored or pleated elbows for 30, 45, 60, and 90 degrees unless space restrictions require mitered elbows. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
7. Round Elbows Larger Than 14 Inches in Diameter and All Flat-Oval Elbows: Fabricate gored elbows unless space restrictions require mitered elbows.
8. Die-Formed Elbows for Sizes through 8 Inches in Diameter and All Pressures 0.040 inch thick with 2-piece welded construction.
9. Round Gored-Elbow Metal Thickness: Same as non-elbow fittings specified above.

2.6 FLEXIBLE DUCTS

A. Flexible ducts

1. Use only where indicated on the Drawings
2. UL 181, Class I Air Duct
3. Labeled for compliance with IMC
4. Minimum working pressure

    a. 0 to 4 inch positive static pressure class: 4 inches
    b. 0 to 1 inch negative static pressure class: 1 inch

5. Acoustic Performance

    a. Regenerative noise due to air turbulence within the duct shall not exceed the following sound power levels for a 12 inch diameter duct with an air speed of 1,000 feet per minute.

	Sound Power Levels, dB re. 10^{-12} Watts, at Octave Band Center Frequency, Hz				
	125	*250*	*500*	*1000*	*2000*
Maximum Regenerative Noise	*30*	*31*	*30*	*22*	*20*

6. Insulated Flexible Duct

    a. Chlorinated polyethylene (CPE) inner liner duct permanently bonded to a vinyl or zinc coated spring steel wire helix
    b. Fiberglass insulating blanket; minimum R-value

(1) Ducts outside the conditioned space and in conditioned envelope: 4.2
(2) Ducts outside conditioned space and conditioned envelope: 8.0

c. Low permeability outer vapor barrier of fiberglass bi-directional reinforced metallized film laminate
d. Flexmaster Type 8M

7. Uninsulated Flexible Duct

a. Woven fiberglass fabric with flame retardant coating permanently bonded to a vinyl or zinc coated spring steel wire helix
b. Flexmaster Type 4NI

B. Flexible ductwork clamps

1. Straps listed for use with flexible ductwork
2. Stainless-steel strap with cadmium-plated hex screw to tighten band with a worm-gear action.

a. Adjustable toggle type
b. Dura Dyne Dyna-Clamps or equal

2.7 FLUES

A. Category I appliances

1. Type B, double wall, factory-built, UL 441 listed for Category I appliances burning natural gas for flue gases less than 550 degrees Fahrenheit.
2. The vent shall have an inner gas carrying pipe of aluminum alloy or stainless steel. The outer jacket shall be G-90 galvanized or aluminum coated steel. The space between the inner and outer pipe, the thickness of materials, and construction of the modular sections and accessories shall be as specified by the terms of the product's UL Listing.
3. The stack system shall be from one manufacturer and shall be complete with caps, supports, and bracing.
4. Where exposed to weather, the outer closure band shall be sealed to prevent rainwater from entering the space between inner and outer walls.
5. Metal-Fab Model M, Selkirk Metalbestos RV, or equal

B. Category III appliances

1. Positive pressure, double wall, factory-built, UL 01738 listed for Category III appliances burning natural gas
2. The vent shall have an inner gas carrying pipe of Type 304 stainless steel. The outer jacket shall be aluminum coated steel. The space between the inner and outer pipe, the thickness of materials, and construction of the modular sections and accessories shall be as specified by the terms of the product's UL Listing.
3. The stack system shall be from one manufacturer and shall be complete with caps, supports, and bracing.
4. Where exposed to weather, the outer closure band shall be sealed to prevent rainwater from entering the space between inner and outer walls.
5. Metal-Fab Model PIC, Selkirk Metalbestos PS, or equal

C. Category IV appliances

1. Positive pressure, double wall, factory-built, UL 1738 listed for Category IV appliances burning natural gas
2. The vent shall have an inner gas carrying pipe of AL-29-4C superferritic stainless steel. The outer jacket shall be 430 stainless steel. The space between the inner and outer pipe, the thickness of materials, and construction of the modular sections and accessories shall be as specified by the terms of the product's UL Listing.
3. The stack system shall be from one manufacturer and shall be complete with caps, supports, and bracing.
4. Where exposed to weather, the outer closure band shall be sealed to prevent rainwater from entering the space between inner and outer walls.
5. Metal-Fab Model CG, Selkirt Saf-T Vent CI Plus, or equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades

B. See Section 23 09 00 – Energy Management & Control Systems

C. See Section 23 08 00 – Mechanical Commissioning

3.2 MOUNTING AND ALIGNMENT

A. See Section 23 05 48 – Mechanical Sound and Vibration Control

3.3 DUCT CLASSIFICATION

A. Minimum operating pressure for each duct system, general

1. Scheduled static pressure for each fan or unit, positive or negative, unless otherwise indicated on the Drawings
2. Adjust upward to nearest pressure class tabulated in SMACNA HVAC Duct Construction Standards

B. Static pressure class, unless otherwise indicated on the Drawings

Application	SMACNA Pressure Class
Discharge of air handlers through shaft fire/smoke damper	4 inches
Air distribution duct from fire/smoke damper to VAV terminal boxes	3 inches
VAV downstream of terminal boxes	1 inch
Toilet exhaust	-2 inches
Return	-2 inches
Other fans systems	Per fan static
Return air transfers	1 inch negative

3.4 DUCTWORK INSTALLATION

A. General

1. Install ducts in accordance with manufacturer's written installation instructions
2. Ductwork exposed to occupant view shall be run straight and true, in line with building elements. No sagging or out-of-true straight runs shall be acceptable. Sidewall taps and duct joints shall be clean and free of visual blemishes and all sealant shall be internal to joint and not visible. Ducts shall have no external markings or tags. All duct beads shall be parallel.
3. Construct with gages, joints, bracing, reinforcing, and other details per latest IMC, ASHRAE, SMACNA and NFPA, unless specified otherwise

    a. Comply with most stringent
    b. Provide ducts with IMC gages or thicker when traversing rated corridors
    c. Combustion air ducts: Minimum 24 gage

4. Construct of galvanized sheet metal, except where otherwise indicated herein or on Drawings
5. Provide for duct rigidity by either of these methods

    a. Beading at 12 inches on center, maximum
    b. Crossbreak outward in ducts having positive internal pressure
    c. Crossbreak inward in ducts having negative internal pressure

        (1) Exception: All ducts exposed to rain shall outward crossbreak on top of the duct.

6. Duct dimensions indicated are outside duct dimensions (OD) unless indicated on the Drawings as inside dimension (ID or net, clear dimension).
7. Alter duct sizes on basis of equal friction where required to facilitate installation. Reflect changes in shop drawings for review by Professional.
8. At duct penetrations of walls, floors and ceilings where exposed to occupant view, provide sheet metal angle type escutcheons with no sharp corners or edges

    a. Clearance from duct to opening shall not exceed 2 inches
    b. Escutcheons shall overlap wall, floor, or ceiling surface by ½ inch minimum

9. Frame, trim, caulk and seal all duct penetrations through acoustical walls and partitions
10. Tapers

    a. Pitch sides of duct in diverging or converging airflow maximum of 1 to 4 taper
    b. Abrupt, bushing type fitting not allowed

11. Duct openings

    a. Provide openings where required to accommodate thermometers, smoke detectors, controllers, and the like. Insert through airtight rubber grommets.
    b. Where openings are provided in insulated ductwork for insertion of instruments, install insulation material inside metal ring for use as plug.
    c. At fire dampers allow adequate length of duct to install access door.

12. Avoid penetration of ducts; provide airtight seal at unavoidable penetrations of hanger rods
13. No exposed sharp metal allowed

    a. All exposed pins, screws and sharp objects shall be covered with hardening silicon
    b. All exposed sheet metal edges shall be hemmed with exposed corners rounded smooth
    c. Remove all sheet metal fish hooks

14. Install lining in ducts and plenums as specified in Section 23 07 00 – Mechanical Insulation.
15. Flexible Connections

    a. Coated glass fabric
    b. For indoor or outdoor use
    c. Use diaphragm type at plug fan inlets
    d. Install at connections to fans and air handling units and as indicated on Drawings
    e. 2 inch slack in fabric; install to allow minimum movement of 1 inch in both tension and compression
    f. Protect from direct solar and rain exposure with sheet metal shroud where outdoors

16. Volume dampers: Install dampers as specified in Section 23 33 00 – Duct Accessories

B. Elbows and Splits

1. Use radius elbows in rectangular ducts unless otherwise indicated on the Drawings: Centerline radius dimension shall not be less than 1-1/2 duct width
2. Where space does not permit duct radius specified above install short radius splitter vanes per SMACNA HVAC Duct Construction Standard

    a. Number of vanes determined by ratio of inner radius (R) to duct width in plane of radius (W)
    b. One vane: Radius to width ratio above 0.3
    c. Two vanes: Radius to width ratio between 0.1 to 0.3
    d. Three vanes: Radius to width ratio 0.1 and smaller

3. Use square turns with turning vanes in rectangular ductwork, unless otherwise indicated on the Drawings, at following locations

    a. Use only where full radius elbow cannot fit
    b. Use only in ducts with 2000 fpm or less design velocity
    c. In high and medium pressure ductwork spot weld turning vane to duct

C. Rectangular Duct Joints

1. Transverse Joints

    a. In medium pressure ductwork shall be Fabriduct TDC or Ductmate or equal
    b. In low pressure ductwork shall be Fabriduct TDC or equal except that ducts under 19 inches longest side may be slip & drive (S&D)

2. Longitudinal seams shall be Pittsburgh. Snap lock not allowed

D. Plenum walls, blank-offs, and casings

1. Construct per SMACNA HVAC Duct Construction Standard, Casings and Plenums
2. Static pressure class

    a. Upstream of fan: -2 inches
    b. Downstream of fan: fan static pressure or greater

3. Seal all joints, edges, and penetrations as per HVAC ducts as specified herein.

E. Round and oval ductwork

1. Joints between ducts

    a. Made with beaded sleeve joints as scheduled
    b. Duct sealer applied to male end
    c. Mechanically fastened with sheet metal screws or pop rivets
    d. Over joint and screw or rivet heads, apply coating of duct sealer.

        (1) Duct where exposed to occupant view: Sealant shall be within joint only and not visible

2. Joints, duct and fitting

    a. Slip projecting collar of fittings into duct: Per SMACNA HVAC Duct Construction Standard
    b. Apply duct sealer: Seal and tape as specified above
    c. Mechanically fasten: Fastening schedule: Per SMACNA HVAC Duct Construction Standard

3. Branch take-offs

    a. Medium pressure: 45 degrees (fittings)
    b. Low pressure: straight 90 degrees (fittings)

4. Horizontal supports

    a. One or two piece clamp band strap
    b. Minimum: one per section
    c. Support fittings as required to prevent sagging

5. Vertical Supports: one of the following

    a. Clamp bands with extended ends supported by floor
    b. Clamp bands with knee bracing
    c. Pedestal at base of vertical

F. Flexible ductwork

1. Not allowed for:

    a. Product conveying systems such as kitchen exhaust and laboratory exhaust
    b. Dryer exhaust (other than final exposed connection at dryer)
    c. Medium and high pressure ducts

2. Continuous, single pieces
3. Length

    a. Low pressure

        (1) Maximum 5 feet, except where longer lengths are indicated on drawings. Where longer lengths are shown, the last 3 feet to 5 feet shall be wire flex duct and remaining ductwork shall be aluminum flex duct.
        (2) Minimum length: 3 feet

4. End Connections

a. Connect to duct collars, terminal unit connections and round air outlets per manufacturer's instructions
b. Secure with strap clamps specified above

5. Installation

a. Support adequately to avoid excessive droop
b. Minimum inside bending radius not less than one duct diameter
c. Install as straight as possible except as shown on drawings for sound attenuation
d. Cut ducts to lengths required rather than create bends to take up excess lengths except as shown on drawings for sound attenuation

G. Grille connections

1. Provide at entry to diffuser collar either

a. Straight duct for 1 duct diameters or greater
b. Full radius elbow
c. Side inlet plenum

(1) Height: 4 inches minimum taller than top of grille to provide room for uniform airflow to grille
(2) Width/length: 2 inches wider than duct or round diffuser collar, whichever is larger
(3) Internal surfaces lined with minimum 1/2 inch thick Type AL duct liner as specified under Section 23 07 00 – Mechanical Insulation
(4) At contractor’s option, where plenum is required at round neck diffuser, square neck diffuser with length and width equal to diffuser diameter may be substituted

d. Flexmaster FlexRight Elbow or equal

2. Connections at grilles shall be insulated to the extent the duct is insulated including the final register box.
3. Seal connections at grilles per seal class of upstream ductwork.

H. Duct hangers and supports

1. General

a. Support horizontal ducts with hangers of size and spacing as indicated in pertinent SMACNA HVAC Duct Construction Standards
b. Attachment to structure: See Section 23 05 29 – Hangers and Supports

2. Horizontal Duct Supports

a. Install hangers at each change in direction of duct
b. Strap hangers

(1) Extend strap down both sides of ducts
(2) Turn under bottom one inch minimum
(3) Metal screw hangers to

a) Bottom of duct
b) Upper and lower sides of ducts

c) Not more than 12 inches on center

c. Angle hangers

(1) Provide angle hangers formed by extended vertical bracing angles
(2) Or by rods connecting to bottom angles if size or bracing angles conform to hanger schedule

3. Vertical duct supports

a. Support vertical ducts at every floor
b. Use angles or channels mechanically fastened to ducts with screws or pop rivets.
c. Set angles or channels on floor slab or structural steel members placed in opening, unless otherwise indicated on the Drawings

I. Ducts exposed to weather

1. Make ducts subject to rain watertight.
2. Construct as follows to assure water run-off

a. Arrange standing seams to not act as dams
b. Longitudinal seams at bottom of duct
c. Construct all ducts subject to rain watertight and to insure water runoff by one or more of following techniques

(1) Slope entire top of duct down toward side.
(2) Vertical struts within duct to bow top panels of duct into convex shape

3. Seal as specified herein.

J. Sound-rated duct packing

1. Wherever possible avoid duct penetrations through sound-rated walls, floors and ceilings.
2. Provide packing for unavoidable duct penetrations per Section 23 05 48 Mechanical Sound, and Vibration Control.

K. Joint Sealing

1. Seal ducts per the Seal Levels tables below

a. Provide more stringent sealing if required to meet requirements of Paragraph 3.6 and 3.7.

Seal Level Requirement				
Duct Location	Duct Type			
	Supply		Exhaust	Return
	≤2 in. water column[b]	>2 in. water column[b]		
Outdoors	A	A	A	A
Unconditioned Spaces	A	A	A	A
Return Air Plenums	A	A	A	A

Conditioned Spaces	A	A	A	A
[b] Duct design static pressure classification.				

Seal Level Definitions	
Seal Level	Sealing Requirements
A	All transverse joints, longitudinal seams, and duct wall penetrations
B	All transverse joints and longitudinal seams
C	Transverse joints only

Longitudinal seams are joints oriented in the direction of airflow. Transverse joints are connections of two duct sections oriented perpendicular to airflow. Duct wall penetrations are openings made by any screw fastener, pipe, rod or wire. Spiral lock seams in round and flat oval duct need not be sealed. All other connections are considered transverse joints, including but not limited to taps and other branch connections, access door frames and jambs, duct connections to equipment, etc.

2. Ducts not exposed to weather: Seal using one of the following:

    a. Duct sealer per Paragraph 2.2C.2.a
    b. Gasketted TDC or Duct-Mate
    c. Flexible duct

        (1) Secure with straps or clamps as specified herein.
        (2) Supplement with duct tape, both inner and outer liner.

3. Duct exposed to weather

    a. TDC or Duct-Mate joints: Utilize interior joint gasket material plus a bead of butyl rubber sealant at the joint and continuous metal clip or cleat over the top of all four joints (top bottom and sides).
    b. Apply two part hard-setting joint tape to

        (1) Longitudinal joints
        (2) Horizontal joints
        (3) Transverse joints
        (4) TDC or Duct-Mate joints
        (5) Duct penetrations
        (6) Screws through duct
        (7) Gores of elbows

4. Indoor duct where exposed to occupant view: Sealant shall be within joint only and not visible
5. Fire and fire/smoke dampers: Sealant shall be listed as approved on manufacturer's UL installation sheet.
6. Seal punched holes and corner cracks
7. Seal all factory fabricated ducts, including transverse joints on gored elbows
8. Seal end caps
9. After installation and testing reseal joints found to be leaking at no additional cost to the Using Agency. See Paragraph 3.7.

3.5 FLUE INSTALLATION

A. Install in accordance with manufacturer's installation instructions and UL listing requirements and with local codes.

B. Category 1 Appliances: Minimum stack height shall be in accordance with GAMA Venting Tables for Category I Appliances and IMC

C. Support from building structure using rigid structural shapes for attachment of fixed point supports. Anchor supports to structure by welding, bolting, steel expansion anchors, or concrete inserts. Size of structural shapes shall be in accordance with manufacturer's recommendations.

D. Roof penetration pieces shall be UL listed products of the chimney manufacturer. Where roof is pitched up to 45° roof penetration pieces shall be of the pitched type so that it is not necessary to provide a horizontal roof curb. If roof pitch exceeds 45°, provide a curb around roof opening.

E. All inner pipe joints shall be held together by means of formed vee bands and sealed with P077 Silicone Sealant for flue gas temperature up to 600°F, or P071 High Temperature Sealant for flue gas temperatures over 600°F.

F. Screws shall be of the hex head type with shoulder stops and tapered leading threads for easy starting. Nuts for the inner and outer bands shall be retained by means of a free-floating cage to allow easy alignment.

G. Where exposed to weather

1. The outer closure band shall be sealed with the same sealant as the inner joint.
2. Paint with one coat of corrosion and heat resistant primer and cone coat heat resistant paint. Paint color selected by Professional.

H. Termination:

1. Roof termination: Terminate with listed wind resistant flue cap 3 feet above the highest point where it pass through a roof and at least 2 feet higher than any portion of the building within a horizontal distance of 10 feet.
2. Wall termination: Terminate with listed 45° miter cut with bird screen unless otherwise indicated on plans.

3.6 DUCT PRESSURE TESTING

A. Scope of Testing

1. HVAC Ductwork and Plenums

a. Supply

(1) Test only 1-inch (positive or negative) pressure class and greater Standard 90.1 requires 3 inches and above.
(2) Test representative sections totaling no less than 100% of the total installed duct area for the designated pressure class in each system: Duct sections to be tested are to be chosen by Professional. Do not proceed with tests until test sections are designated.
(3) Test field installed supply fan plenums

b. Return: Required
c. Exhaust: Not required
d. Outdoor air: Not required

B. General

1. Pretesting shall be conducted prior to conducting test in presence of Professional. Once all required ductwork has passed the pretest duct pressure test, the Professional shall be notified to visit the site for witness testing.
2. Use portable high pressure blower and necessary instruments to indicate amount of leakage
3. Conduct tests as prescribed in SMACNA HVAC Air Duct Leakage Test Manual, and make test before duct sections are concealed
4. Procedure

    a. Seal openings in ducts and plenums to be tested.
    b. Connect test apparatus to test section using flexible duct connection or hose.
    c. Close damper on blower suction side, to prevent excessive buildup of pressure.
    d. Start blower and gradually open damper on suction side of blower.
    e. Build up pressure in test section equal to static pressure class.
    f. Noise generated from duct leakage not acceptable. Seal as required.
    g. Determine amount of air leakage by makeup air flow measurements:

        (1) Maximum permitted leakage for HVAC ductwork shall be:

$$CFM_{max} = \left(\frac{A}{100}\right) C_L P^{0.65}$$

        Where,

        CFM_{max} = The maximum permitted leakage, cubic feet per minute (cfm).
        A= Surface area of the tested duct sections, square feet.
        C_L= Duct leakage class, cfm/100 square feet at 1 inch water column.
        = 6 for rectangular sheet metal, rectangular fibrous ducts, and round flexible ducts
        = 3 for round/flat oval sheet metal or fibrous glass ducts
        P= Test pressure which shall be equal to the design duct pressure class rating, inches water column.

        (2) Allowable leakage can also be calculated as 1 percent of the design operating air volume for the entire system. If this method is used, the total system leakage must first be determined and then compared with the 1 percent (of system volume flow) allowable leakage. Acceptance is indicated if the actual measured leakage of the entire system is less than the calculated allowable leakage.
        (3) Maximum permitted leakage for life safety ductwork shall be per IMC.
        (4) If leakage exceeds permitted limit, repair leaks and retest duct sections at no additional cost to the Using Agency until permitted leakage limits are obtained.

5. Visually mark tested sections with certification sticker and initials of field test inspector.

C. Documentation

1. Submit certification of test results of compliance to Commissioning Authority.
2. Include certified test results showing compliance per Section 23 00 10 – Mechanical General Provisions.

3.7 SYSTEM LEAK TESTING

A. Scope of Testing

1. Supply: All supply air duct systems
2. Return: All return air duct systems
3. Exhaust: Systems greater than 10,000 cfm design capacity
4. Outdoor air: Not required
5. Seal Class B and C ducts not required to be tested

B. General

1. Tests shall be done after air balancing; see 23 05 93 – Testing, Adjusting and Balancing
2. Determine the maximum allowable leakage per system using the methodology in Paragraph 3.6B.5.g. The duct surface area shall be all ductwork downstream of the fan through the air outlets.
3. Or use the 1 percent allowable leakage as described above.

C. Test conditions

1. Fan balance complete and operating at design airflow conditions
2. For variable volume fans, set all the variable volume boxes to design maximum airflow rates and operate the fan at optimum static pressure setpoint; (see 23 05 93 Testing, Adjusting and Balancing); fan and boxes to remain in a static state during the testing

D. Leakage testing

1. Collect the following information from air balance reports for each tested fan system. (This work is already required in Section 23 05 93 Testing, Adjusting and Balancing, so no new work is required.)

   a. Pitot traverse in the supply (exhaust) duct downstream, positive pressure side (downstream, negative pressure side) of the fan, and
   b. Totaling the readings of individual air outlets or terminals

2. Subtract the readings in Paragraph 3.7D.1. If the difference in the readings, accounting for the accuracy of the test instruments, is greater than the amount allowed in Paragraph 3.7B.3, repair air leaks as required and retest.
3. If leakage exceeds permitted limit, repair leaks and retest duct sections at no additional cost to the Using Agency until permitted leakage limits are obtained.

E. Documentation

1. Submit certification of test results of compliance to Commissioning Authority
2. Include certified test results showing compliance per Section 23 00 10 – Mechanical General Provisions

3.8 PROTECTION

A. Adhere to SMACNA Duct Cleanliness for New Construction Guidelines for Intermediate Level Duct Cleanliness unless more stringent requirements are indicated herein.

B. Storage: Porous materials, such as lined and flexible duct, shall be stored where they will not be exposed to rain or other moisture sources.

C. Temporary closure: Provide temporary closure of polyethylene film or other covering which will prevent entrance of dust and debris at the following conditions:

1. Exposed ends of unlined installed ducts at the end of each day
2. Exposed ends of lined ducts or plenums whether in storage or installed

D. Duct cleaning

1. Using the connected fan(s) force air at high velocity through duct to remove accumulated dust
2. Protect equipment and spaces, which may be harmed by excessive dirt with filters, or bypass during cleaning
3. In areas, which must be kept dust free, seal all outlets duct tight. When closures are removed avoid spilling dust in room

3.9 INSPECTION

A. Verify that adequate clearance between ducts and adjacent walls or equipment is available to permit proper sealing, maintenance and repairs.

3.10 PRE-OPERATING CHECKS

A. Before operating the duct systems: Set all manual dampers in full open position

B. Complete the attached Pre-Functional Test Data Sheet, in specification 23 08 00, for each duct system.

3.11 TESTING AND ADJUSTING

A. Before starting the duct systems

1. Clean the duct system. See Paragraph 3.8D
2. See Section 01 91 00 – Commissioning

B. After starting the duct systems: Check for noise and leakage. See Paragraphs 3.6 and 3.7. Repair as required at no additional cost to the Using Agency.

C. See Section 23 05 93 – Testing, Adjusting, and Balancing: Coordination with Balance Agency:

1. Provide services of a sheet metal installer familiar with the system ductwork to provide assistance to the balancing agency during the initial phases of air balancing in locating all sheet metal dampers
2. Install missing dampers

D. See Section 23 08 00 – Mechanical Commissioning

END OF SECTION 23 31 13

SECTION 23 33 00 – DUCT ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Access Doors
2. Balancing Dampers
3. Backdraft Dampers
4. Fire dampers
5. Fire and Smoke Dampers
6. Sound Attenuators
7. Wall Louvers
8. Combination Louvers/dampers
9. Drain Pans
10. Belt Guards
11. All duct accessories except, where integral with manufactured piece of equipment.

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 QUALITY ASSURANCE

A. Fire, smoke, and fire/smoke dampers shall be UL listed and constructed in accordance with UL Standard 555 Fire Dampers and UL Standard 555S.

B. Demonstrate operation of smoke dampers to authorities having jurisdiction and Professional as part of life safety testing.

C. Access doors shall be UL labeled.

D. Damper pressure drop and leakage ratings shall be based on tests and procedures performed in accordance with AMCA 500 - Test Methods for Louvers, Dampers and Shutters.

1.4 SUBMITTALS

A. See Section 23 00 10 Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings according to the following table.

1. "R" means required
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Access doors	R2			R
Balancing dampers	R2			R
Automatic dampers	R	R		R
Backdraft dampers	R2			R
Fire dampers	R	R		R
Smoke dampers	R	R		R
Fire/Smoke dampers	R	R		R
Sound attenuators	R	R		R
Wall louvers	R			R
Combination louvers/dampers	R	R		R
Drain pans	R2			R
Condensate pumps	R	R		
Belt guards	R2			

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Access Doors, Ducts

1. Ventfabrics, Inc.
2. Duo Dyne, Corporation
3. Ruskin Mfg. Company
4. PCI Industries – Pottorff
5. Ductmate

C. Access Doors, Plenum

1. Ventfabrics, Inc.
2. Duo Dyne, Corporation
3. Elgen Manufacturing Company

D. Balancing and Automatic Dampers

1. Ruskin Manufacturing Company

2. Air Balance Inc.
3. American Warming and Ventilating Inc.
4. Johnson Controls
5. PCI Industries - Pottorff

E. Backdraft Dampers

1. Greenheck Fan Corp
2. Ruskin Manufacturing Company
3. Air Balance, Inc.
4. American Warming and Ventilating Inc.

F. Damper Hardware

1. Ventfabrics, Inc.
2. Duo Dyne, Corporation
3. Young Regulator Company

G. Fire Dampers and Combination Smoke and Fire Dampers

1. Ruskin Manufacturing Company
2. Greenheck Fan Corp.
3. Air Balance Inc.
4. PCI Industries - Pottorff

H. Sound Attenuators

1. Vibro-Acoustics
2. Industrial Acoustics, Inc.
3. Quiet Duct
4. Price Industries
5. Kinetics

I. Wall Louvers and Combination Louver/dampers

1. Ruskin Manufacturing Company
2. Greenheck Fan Corp.

J. Acoustical Plenums

1. Aerosonics, Inc.
2. Industrial Acoustics Inc.
3. Rink
4. Environmental Elements Corporation, Koppers Company
5. United McGill Corporation

2.2 DUCT ACCESS DOORS

A. In accordance with SMACNA Duct Construction Manuals, except as indicated in the Drawings

B. In ductwork

1. Construction

a. Galvanized steel
b. Rating same as duct pressure class
c. Where duct is insulated

(1) Fiberglass insulation, thickness to match duct insulation installed R-value, see 23 07 00 – Mechanical Insulation
(2) Double wall

d. Removable type with safety chain linking door permanently to frame
e. Positive seal polyethylene gasket
f. Paired progressive cam-locks, quantity as required for tight, low leakage fit
g. No tools required for opening and closing

2. Size

a. 20 inches x 14 inches unless otherwise indicated in the Drawings
b. Ducts less than 16 inches: one dimension 20 inches; other dimension 2 inch less than duct width
c. Larger sizes where required for access

3. Provide in following locations

a. Coils in ducts (including at VAV boxes)

(1) Entering and leaving side for cooling coils
(2) Entering side for heating coils

b. Automatic dampers: linkage side
c. Smoke dampers
d. Fire dampers
e. Smoke detection heads
f. At the top of each lined duct riser accessible from the fan room floor (for inspection of duct liner)
g. Fan bearings enclosed in ducts
h. Sprinkler heads in ducts
i. Motors, actuators or other accessories that require access or service inside ducts
j. Outdoor air plenums as required to clean plenum from dirt and debris.
k. Where otherwise indicated on the Drawings

2.3 DAMPERS

A. Volume Dampers

1. Conform to requirements of SMACNA HVAC Duct Construction Standards.
2. General

a. Blades of same material as duct where damper is located
b. Damper Hardware

(1) Ventlok 400 and 4000 series or equal; for low pressure systems 2 inch SMACNA pressure class and less
(2) Ventlok HiVel hardware or equal; for greater than 2 inch SMACNA pressure class

c. Actuating quadrants typical for single and multi-blade dampers; provide closed bearing

on opposite end from quadrant to prevent air leakage: Ventlok No. 609 or equal
d. Bearing at one end of damper rod: Ventlok No. 609 or equal
e. Sealed bushings installed at both ends to avoid duct leakage
f. Accessible quadrant at other end of damper rod

(1) With lever and lock screw: Ventlok No. 635 or equal
(2) Insulated ducts

a) Quadrants mounted on collar to clear insulation
b) Ventlok Nos. 637, 638, or 639 or equal
c) Selection based on insulation thickness

g. For dampers above non-removable ceilings and without ceiling access panels provide Ventlok No. 677 or equal concealed damper regulator

(1) With paintable cover plate
(2) Required interconnecting hardware

3. Single blade dampers

a. Galvanized steel ductwork: galvanized steel, except as indicated in the Drawings
b. Blade: Two gages heavier than duct gage, or 18 gage, whichever is lighter

4. Multi-blade Dampers

a. Low Pressure/Low Velocity Systems (2 inch water column or less static pressure class and 1500 fpm or less face velocity)

(1) Opposed blade damper
(2) Ruskin Model CD35 or equal

b. High Pressure/High Velocity Systems (greater than 2 inch water column static pressure class or greater than 1500 fpm face velocity):

(1) Rectangular

a) Opposed blade damper
b) Ruskin Model CD60 or equal

(2) Round and Oval

a) Oval: Ruskin Model CDR25 and DO25 or equal
b) Round: Up to 20 inch diameter: Ruskin Model MDRS25 or equal
c) Round: Larger than 20 inch diameter: Ruskin Model CDRS25 or equal

B. Automatic Dampers

1. Refer to Section 23 73 13 – Air Handling Units dampers provided with factory packaged air handling equipment.
2. Actuators: See Section 23 09 13 – EMCS Basic Materials and Control System
3. Construction

a. Return air dampers (AHUs)

(1) Class 2 smoke-rated Ruskin Model SD-36 or equal

(2) End switches: Provide end switch to indicate fully-closed position.

b. Blade Action

(1) Throttling duty: opposed
(2) Mixing duty: parallel
(3) Two-position: parallel or opposed

c. Bearings: Molded synthetic sleeve, turning in extruded hole in frame.
d. Seals:

(1) Blade: Inflatable PVC coated fiberglass material or neoprene mechanically attached to blade edge.
(2) Jamb: Flexible metal compression type.

e. Linkage: concealed in frame. External linkage and jack-shafts will not be accepted.
f. Axles: Minimum 1/2 inch diameter plated steel, hex-shaped, mechanically attached to blade. Side access for direct-coupled actuator.

4. Finish: Mill galvanized
5. Damper area: See Drawings for sizes
6. Low Pressure/Low Velocity Systems (2 inch water column or less static pressure class and 1500 fpm or less face velocity)

a. Ruskin Model CD36 or equal
b. Integral, heavy-duty factory-installed motorized damper acceptable for exhaust fans unless otherwise scheduled

7. High Pressure/High Velocity Systems (greater than 2 inch water column static pressure class or greater than 1500 fpm face velocity):

a. Ruskin Model CD60 or equal

C. Backdraft Dampers

1. Required locations

a. Where indicated on the Drawings
b. In suction or discharge of all exhaust fans as listed in equipment schedule

(1) Integral, heavy-duty factory-installed type acceptable unless otherwise scheduled

2. General Applications

a. Construction

(1) Extruded aluminum construction
(2) Extruded vinyl locked into blade edge
(3) Blade ends overlapping frame

b. Performance

(1) Start to open: .02 inches w.g. or less
(2) Fully open: .05 inches w.g. or less
(3) Leakage for 24 inch wide damper: 25 cfm per ft^2 or less.

c. Ruskin Series CBD4 or equal

3. High Velocity Applications

a. Applies to discharge of air handlers and where velocity exceeds 1500 fpm. Damper shall be specifically designed for location at turbulent fan discharge.
b. Frame

(1) Minimum 12 gage galvanized steel channel
(2) Bolt Holes: Both flanges

c. Blades

(1) Airfoil-shaped with integral structural reinforcing tube running full length of each blade
(2) Material: 7 inches x minimum 0.080 inch Alloy 6063-T5 extruded aluminum
(3) For multiple section dampers, provide galvanized steel or aluminum bracket to link dampers so they operate together.

d. Axles: Minimum 3/4 inch diameter plated steel
e. Bearings: Bolt-on bearings with re-lube ball bearings
f. Linkage

(1) 3/16 inch thick x 3/4 inch plated steel tie bar with minimum 16 gage plated steel linkage arms; stainless steel pivot pins
(2) Located out of airstream (side or external linkage)

g. Counterbalance: Located out of airstream
h. Seals

(1) Blade

a) Mechanically attach blade seals to blade
b) Silicone rubber, rated for 300 degrees Fahrenheit

(2) Jamb: Vinyl

i. Ruskin CBS92 or equal

2.4 FIRE DAMPERS

A. Ratings (test conditions and label) per UL Standard 555

1. 250 degrees Fahrenheit minimum
2. 1-1/2 hour fire rating, unless otherwise indicated in the Drawings
3. Dynamic (closes against air flow)

B. Factory sleeve

C. Damper

1. Multi-bladed, equipped with fusible link, spring loaded type
2. Style

a. As indicated on the Drawings
b. Ducted, rectangular duct: Style B (out of airstream)
c. Ducted, round duct: Style A (in airstream) with damper sleeve 2” in each dimension larger than duct; plus cap and collar.
d. Unducted: Style A (in airstream)

D. Fusible link

1. UL listed
2. Fusible links on fire dampers shall be constructed to UL Standard 33 – Fusible Links for Fire Protection Service
3. Temperature rating: Per code

E. Type: as indicated on the Drawings

F. Type:

1. Rectangular type up to 1000 feet per minute: Ruskin DIBD2 or DIBD10 Style A or equal
2. Rectangular type 1000 feet per minute and higher: Ruskin DIBD2 or DIBD10 Style B or equal
3. Circular and oval type: Ruskin DIBD2 Style CR and CO, or DIBD10 Style R and LO or equal

G. Status end switches:

1. Where indicated on the Drawings
2. Ruskin SP100 or equal Switch Package

2.5 COMBINATION SMOKE AND FIRE DAMPERS

A. Fire ratings (test conditions and label) per UL Standard 555

1. 250 degrees Fahrenheit minimum
2. 1-1/2 hour fire rating, unless otherwise indicated in the Drawings

B. Factory sleeve

C. Damper

1. Two-position duty: Either parallel blade or opposed blade
2. Leakage class as scheduled, minimum Class 2, rated per UL 555S
3. 120 volt actuator
4. Locate damper in sleeve starting at approximately 3” from end of the sleeve opposite the damper actuator end. (Damper shall be installed with this end protruding 3 inches out from inside surface of wall.)

D. Actuator

1. 120 volt
2. Two-position unless otherwise indicated on drawings
3. Spring return normally closed unless otherwise indicated on drawings
4. Electronic cut-out at full-open so that actuator creates no noise holding open
5. Permanently lubricated gears
6. Direct coupled with steel clamp; aluminum clamp and external linkage not acceptable

E. Controls

1. Heat-actuated electric release
2. Controlled closure to prevent duct and HVAC component damage
3. Time to drive from full closed to open and or spring from full open to closed shall not exceed the following:

   a. FSD's: 15 seconds
   b. All others: 75 seconds.

4. Damper to automatically reopen after a test, smoke detection or power failure condition. In the event of heat activated closure, the damper must be manually reset at the damper.
5. Release temperature: as scheduled on drawings or use the following: 165 ºF. This must be <286 ºF for life safety system or whatever design-fire temperature is for exhaust dampers. Should be about 50°F above normal temperature, not less than 160°F per IBC. In non-life safety buildings, use 165ºF. For life safety bldgs with smoke control, use 250ºF which is more than 50ºF above the design smoke temperature, typically 165ºF.

6. Ruskin EFL or equal

F. Status end switches: None required.

G. Status end switches:

3. Where indicated on the Drawings
4. Ruskin SP100 or equal Switch Package

H. Type: as indicated on the Drawings

I. Type

1. Ruskin Type FSDR25, or equal for round ducts. (UL R5531, CSFM #3230-245:108)
2. Ruskin Type FSD36, or equal for 1800 feet per minute and below. (UL R5531, CSFM #3235-0245:0124)
3. Ruskin Type FSD60 or equal for 1800 feet per minute and above. (UL R5531, CSFM #3235-0245:0126).
4. Alternative Ruskin Type FSD60FA or equal for 1800 feet per minute and above. (UL R5531, CSFM #3230-245:116 respectively).
5. Ruskin Type FSD60M, for short sleeve where needed. (UL R5531, CSFM #3230-245:110)

J. Smoke Detector

1. Detects presence of smoke in the airstream of ductwork in HVAC systems without a minimum operating velocity including no flow operation.
2. UL Listed
3. CSFM Listing
4. Ruskin DSDN, or as provided by Div-26 or equal

2.6 DRAIN PANS

A. Field Installed Drain Pans

1. Required at field installed

a. Cooling coils

2. Pan material

a. 20 gage stainless steel

3. Supports: galvanized steel
4. Extend under coil casing

a. Upstream: minimum 3 inches
b. Downstream: minimum 18 inches or half the coil finned-height, whichever is larger

5. Extend on sides

a. To wall of casing
b. To receive condensate from piping and controls

6. Provide additional intermediate pans for coils mounted more than one section high
7. Slope to drain. Level installation not acceptable.
8. Drain connection:

a. Size per IMC based on coil capacity
b. Mounted in bottom of pan at lowest point or outside with a flush mount that allows complete draining

B. Auxiliary Drain Pans

1. Required at following locations:

a. Fan-coil units with cooling located in attics or above furred ceilings where required by IMC – Condensate Control. Not required if main drain pan includes secondary drain connection for this purpose

1) Size to capture any overflow from unit condensate drain pan

b. Fan-coil units with cooling located within rooms housing electrical equipment such as power panels, control panels, transformers, and computer equipment

1) Size to capture any overflow from unit condensate drain pan and extended to capture drips from control valves, strainers, and unions

2. Construction: galvanized steel

2.7 SOUND ATTENUATORS

A. Factory prefabricated

B. General

1. Transitions on inlet and outlet will not be accepted. Silencers shall fit the ducting system they are installed in without requiring duct fittings/transitions. Silencer inlet and outlet must match duct dimensions. See contract documents for silencer configuration.
2. Silencers shall be constructed in accordance with ASHRAE and SMACNA standards for the pressure and velocity classification specified for the air distribution system in which it is

installed. Material gauges noted in other sections are minimums. Material gauges shall be increased as required for the system pressure and velocity classification. The silencers shall not fail structurally when subjected to a differential air pressure of 8 inches water gauge.

3. All casing seams and joints shall be lock-formed and sealed or stitch welded and sealed except as noted in Section G below, to provide leakage-resistant construction. Airtight construction shall be achieved by use of a duct-sealing compound supplied and installed by the contractor at the jobsite.
4. All perforated steel shall be adequately stiffened to insure flatness and form.

C. Shell

1. Galvanized steel – G90: minimum 22 gage
2. Leakproof at pressure differential of 8 inches water gage

D. Media:

1. Flamespread: maximum 25
2. Fuel contributed and smoke developed: maximum 50
3. Minimum 4.5 pounds per cubic foot density glass or mineral fiber packed under 5 percent compression
4. Media shall meet erosion test method described in UP Publication No. 181
5. Filler to be inert, vermin and moisture proof
6. Surfaces in contact with airstream shall comply with ASHRAE 62.1-2010.

E. Internal construction: Galvanized perforated steel baffles: minimum 24 gauge

F. Principal Sound-Absorbing Mechanism

1. Dissipative silencers:

a. Media shall be of acoustic quality, shot-free glass fiber insulation with long, resilient fibers bonded with a thermosetting resin. Glass fiber density and compression shall be as required to insure conformance with laboratory test data. Glass fiber shall be packed with a minimum of 15% compression during silencer assembly. Media shall be resilient such that it will not crumble or break, and conform to irregular surfaces. Media shall not cause or accelerate corrosion of aluminum or steel. Mineral wool will not be permitted as a substitute for glass fiber.

G. Attenuator Performance

1. See schedule on the Drawings for

a. Net insertion ratings
b. Maximum allowable air pressure drop
c. Model number

H. Certified tests

1. Submit a laboratory certified test data for pressure drop and insertion loss ratings

a. For square or rectangular attenuators: 24 inch x 24 inch cross-section attenuator
b. For round attenuators: 24 inch diameter conical attenuator
c. Certification data for pressure drop and net insertion loss: based on tests of same attenuator

d. Attenuators and tests: subject to inspection upon request

I. Price, Vibro-Acoustics, Kinetics, Industrial Acoustics, Inc. Quiet-Duct

J. Critical area attenuator

1. General: as specified above
2. Media enclosed in polyvinyl
3. Removable internal parts for cleaning
4. Industrial Acoustics Company, Type HS-3 Clean-Flow or equal

K. Expansion Plenums

1. As indicated on the Drawings

2.8 CONDENSATE PUMP

A. Manufacturer: Little Giant, Diversitech, or equal

B. Provide where scheduled

C. Contractor shall verify pumping head requirements

D. Features

1. Discharge check valve
2. 115-volt with grounded plug connection
3. High level alarm contact

2.9 BELT GUARDS

A. Fabricated per OSHA and SMACNA Duct Construction Standards

2.10 WALL LOUVERS & COMBINATION LOUVER/DAMPERS

A. Louvers licensed to bear AMCA Certified Ratings Seal. Ratings based on tests and procedures performed in accordance with AMCA 511 and comply with AMCA Certified Ratings Program. AMCA Certified Ratings Seal applies to air performance and water penetration ratings.

B. Materials

1. Frame

a. Extruded aluminum, Alloy 6063-T5
b. Wall Thickness: 0.081 inch, nominal
c. Depth: 6 inches minimum
d. Downspouts and caulking surfaces

2. Blades

a. Horizontal rain resistant style
b. Extruded aluminum, Alloy 6063-T5

c. Wall Thickness: 0.081 inch, nominal
d. 2 inch blade spacing

C. Screen

1. Aluminum wire screen
2. 14 gage
3. 3/4 inch x 0.051 inch mesh
4. Frame: Removable, rewireable
5. Mounted on inside of louver

D. Gutters: Drain gutter in head frame

E. Downspouts: Downspouts in jambs to drain water from louver for minimum water cascade from blade to blade

F. Vertical Supports: Hidden vertical supports to allow continuous line appearance up to 120 inches

G. Sill: Steeply angled integral sill eliminating areas of standing or trapped moisture where mold or mildew may thrive and effect indoor air quality

H. Assembly: Factory assemble louver components; mechanically fastened

I. Blank off panels for unused portions of louvers: 20 gage galvanized sheet metal

J. Factory Finish

1. Standard mill finish
2. Kynar 500 (70% Kynar Resin) 2-Coat Fluoropolymer Coating or equal

a. Conform to AAMA 2605-98
b. Apply coating following cleaning and pretreatment
c. Cleaning: AA-C12C42R1X
d. Dry louvers before final finish application
e. Total Dry Film Thickness: Approximately 1.2 mils, when baked at 450 degrees Fahrenheit for 10 minutes
f. Warranty: Limited 20 year warranty on standard colors
g. Color: Color as selected by Professional from manufacturer's standard colors

3. Baked Enamel, 50% Kynar Resin 2-Coat Coating or equal

a. Conform to AAMA 2604-98, sections 4.2 & 4.3
b. Apply coating following cleaning and pretreatment
c. Cleaning: AA-C12C42R1X
d. Dry louvers before final finish application
e. Total Dry Film Thickness: Approximately 1.2 mils, when baked at 450 degrees Fahrenheit for 10 minutes
f. Warranty: Limited 20 year warranty on standard colors
g. Color: Color as selected by Professional from manufacturer's standard colors

4. Color Anodize Finish

a. Comply with Aluminum Association AA-C22A44
b. Apply finish following chemical etching and pretreatment
c. Electrolytically deposited color anodized finish

d. Minimum Thickness: 0.7 mils
e. Color: coordinate with Professional.

5. Clear Anodize Finish

   a. Comply with Aluminum Association AA-C22A31; clear anodize finish 204-R1
   b. Apply finish following chemical etching and pretreatment
   c. Minimum Thickness: 0.4 mils, 30 minute anodizing process

6. Prime Coat

   a. Apply alkyd prime coat following chemical cleaning and pretreatment
   b. Primer preparation for field painting

7. Outside air intake: Greenheck EHH-601 or equal. 6-inch deep wind-driven rain louver
8. Exhaust outlet: Greenheck EHH-601 or equal. 6-inch deep wind-driven rain louver
9. Combination louver/damper: Greenheck EACA-601 or equal, 6” frame

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades

B. Install duct accessories in accordance with manufacturer’s written installation instructions

C. See Section 23 31 13 – Ducts

D. Volume dampers

1. Provide at locations indicated on the Drawings

   a. Volume dampers shall be installed as far away from air outlets as functionally reasonable to avoid noise in the occupied space.
   b. Provide also in wyes and branch take-offs to outlets whether indicated on the Drawings or not, except

      (1) Where dampers are not indicated on the Drawings above inaccessible ceilings
      (2) To sidewall outlets in exposed ducts (opposed blade dampers in outlets shall be provided)

2. Additional locations where dampers appear to be required for balancing, place request for information with Engineer prior to construction.
3. For ductwork exposed to occupant view, volume damper handles shall be on top of duct or otherwise concealed from occupant view.

E. Fire and smoke dampers

1. Provide in ducts and openings as indicated in the Drawings
2. Provide access door in duct adjacent to each in location where damper may be inspected and internal fusible link or fire-stat may be replaced
3. Install duct smoke detector provided by Division 26 if required; see Division 26 drawings
4. Smoke and fire dampers installed in tunnel corridors shall have weight of damper supported

from structure above.

F. Control dampers

1. Field mounted control dampers installed with concealed linkage shaft accessible on side of damper with space for direct-coupled actuator
2. Actuator installation: See Section 23 09 13 – EMCS Basic Materials and Devices

G. Install belt guards at all exposed belts

H. Drain pans

1. See Section 22 13 16 – Sanitary Waste and Vent Piping
2. Condensate drain pans (including pans on fan-coils, packaged units, and air handlers)

a. Slope to drain connection to allow complete draining of pan
b. Provide condensate pump where scheduled.
c. Piping from intermediate drain pan to lowest pan

(1) Pipe to within 1 inch of and discharge into lowest drain pan

d. Piping from lowest pan drain connection to sewer

(1) Trap height and offset must allow water seal to remain and to allow complete drainage of pan both when fan is operating or not

e. Field test

(1) Test all drain pans after installation to ensure proper slope and drainage and to prevent conditions of water stagnation that result in microbial growth.
(2) Drainage shall be considered acceptable if after covering the entire pan with 1/2 inch water, the pan drains within 3 minutes to leave puddles no more than 2 inch in diameter and no more than 1/8 inch deep.
(3) Test with the fan system in operation for pans on the suction side of the fan, and with the fan off for pans on the discharge side of the fan.
(4) Document tests: See Section 23 00 10 – Mechanical General Provisions

3. Auxiliary drain pans

a. Piping: See Section 23 21 12 Heating and Cooling Piping
b. Separate drain from main drain pan.
c. Discharge where water flow is readily observed but not over any material or equipment that may be damaged by water.

3.2 MOUNTING AND ALIGNMENT

A. Install all accessories to prevent air leakage.

B. Install closed bearing end on all damper blades that penetrate duct to prevent air leakage.

C. Support extra weight of duct accessories. See Section 23 05 48 – Mechanical Sound and Vibration Control

3.3 INSPECTION

A. Verify that adequate clearance between duct accessories and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 PRE-OPERATING CHECKS

A. Before operating duct accessories: Set all components in normal operating condition

3.5 TESTING AND ADJUSTING

A. Before operating duct accessories see Section 01 91 00 – Commissioning

B. After starting duct accessories

1. Check for noise and leakage; repair as required at no additional cost to the Using Agency
2. Operation test: Test each piece of equipment to show that it will operate in accordance with requirements.

C. See Section 23 05 93 – Testing, Adjusting, and Balancing

D. See Section 23 80 00 – Mechanical Commissioning

END OF SECTION 23 33 00

SECTION 23 34 00 - FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Centrifugal fans
2. Propeller fans
3. Centrifugal inline fans
4. Ceiling exhaust fans
5. Roof mounted fans
6. Axial flow fans
7. Roof type gravity ventilators
8. All fans except where integral with manufactured piece of equipment

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. ANSI/AFBMA Standard 9 – Load Rating and Fatigue Life for Ball Bearings

B. AMCA 99 – Standards Handbook

C. AMCA 210 – Laboratory Methods of Testing Fans for Aerodynamic Performance Rating

D. AMCA 300 – Reverberant Room Method for Sound Testing of Fans

E. AMCA 301 – Methods for Calculating Fan Sound

F. ANSI/AFBMA 11 – Load Ratings and Fatigue Life for Roller Bearings

1.4 QUALITY ASSURANCE

A. AMCA certified ratings per applicable AMCA standard based on the testing conducted in an independent laboratory

B. Performance Ratings: Conform to AMCA 210 and bear the AMCA Certified Rating Seal

C. Sound Ratings: AMCA 301; tested to AMCA 300 and bear the AMCA Certified Sound Rating Seal

D. Fabrication: Conform the AMCA 99

E. Conform to AMCA Bulletins regarding construction and testing

1. Fans shall bear AMCA certified rating seal

F. Scheduled equipment performance is minimum capacity required.

G. Scheduled electrical capacity shall be considered as maximum available.

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Fans	R	R		R
Fan accessories	R	R		

C. Include

1. Complete graph of fan curves, not just curve for design conditions
2. Sound power levels

a. Fans 1 horsepower and larger: dB by octave bands
b. Fans less than 1 horsepower: sones

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Greenheck Fan Corporation

C. Loren Cook Company

D. PennBarry

2.2 GENERAL

A. AMCA certification in accordance with ARI Standard 210 and 211, and AMCA Standard 2408 for centrifugal fans

B. Fans used shall not increase motor size, increase noise level, or increase tip speed by more than 10 percent, or increase inlet air velocity by more than 20 percent, from specified criteria.

C. Performance

1. See fan schedule on the Drawings
2. Capacities: minimum as scheduled on the Drawings
3. Brake horsepower rating: Maximum 10 percent above that scheduled on the Drawings
4. Fans and drives shall be capable of accommodating static pressure variations of plus or minus 10 percent
5. Motor horsepower: No larger than that scheduled on the Drawings, or compensate Division 26 contractor for any associated cost to increasing motor size

D. Wheels

1. Class as stated per AMCA rating for static pressure.
2. Formed steel or extruded aluminum
3. Statically and dynamically balanced in its own bearings with a maximum full amplitude shaft deflection at bearings not to exceed 0.001-inch at 1200 RPM
4. Exposed fan wheels protected by finger proof screen

E. Motors: See Section 23 05 13 – Motors and Controllers

F. Housing

1. Heavy gage steel, spot welded for AMCA 99 designated Class I and II fans, and continuously welded for Class III, adequately braced, designed to minimize turbulence with spun inlet bell and shaped cut-off.
2. Factory finish before assembly with enamel or prime coat
3. Provide bolted construction
4. Weatherproof motor and drive covers at utility sets
5. Provide inspection access panels at the wheels of all blowers
6. Externally paint fans exposed to weather to provide corrosion resistance to the environment
7. Provide 3/4-inch threaded scroll drain.

G. Direct Drive

1. Less that 1 horsepower: Internal thermally protected motor

H. Belt Drive

1. Matched, multiple V-belt
2. Capacity: minimum 1.5 times motor horsepower
3. Pulleys
   a. Cast iron
   b. Variable pitch diameter

(1) Except motors with variable speed drives
(2) Fans up to 7-1/2 hp motor
(3) Fans from 10 hp to 25 hp, under 1000 rpm

c. Fixed pitch diameter

(1) All motors with variable speed drives
(2) Fans 10 hp and over 1000 rpm

d. Select at mid-point of range
e. For fans that operate as part of the life safety system, provide a minimum of two belts

4. Companion sheaves to maintain belts parallel
5. Drive guards

a. Comply with requirements of State OSHA
b. Provide holes in belt guards for tachometer readings
c. Indoor Belt Drives: 16 gage expanded metal or wire screen enclosure with 70 percent free area and steel frame
d. Outdoor Belt Drives: 16 gage solid galvanized sheet metal with stamped louvers near top and bottom for ventilation

I. Bearings

1. Ball, roller or taper

a. Pressure type lubricating fittings with pressure relief fittings

(1) Extended to accessible locations
(2) Lubricating fittings: Equal to Alemite
(3) Pressure relief fittings: Equal to Keystone.

2. Air Handling Quality Bearings
3. Bearing shaft mounting mechanism shall be concentric mount, not set screw mount.
4. Life rating: minimum L10-200,000 hours per AFBMA Standard 9 rating, at maximum catalog rating

J. Painting

1. Prime coat fan wheels and housing factory inside and outside: Prime coating on aluminum parts is not required
2. Provide two additional coats of paint on fans handling air downstream of humidifiers
3. Finish painting not required for fans with corrosion resistant coatings

K. Variable Speed Drive: See Section 23 05 13 – Motors and Controllers

L. Discharge: As indicated on the Drawings

M. Removable flanged screens at inlets or outlets where no connecting ductwork is indicated: Exclude inlets to fans in field erected casings

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades

B. Install fans in accordance with manufacturer's written installation instructions.

C. See Section 23 31 13 – Ducts for duct connections

D. See Section 23 09 00 – Energy Management & Control Systems

E. See Section 23 08 00 – Mechanical Commissioning

F. Flexible duct connection at inlet and outlet: See Section 23 31 13 – Ducts

G. Backdraft Dampers

1. Comply with ASHRAE 90.1 and IMC
2. Provide backdraft or shutoff dampers for suction or discharge of every exhaust fan as scheduled on the Drawings
3. See schedules on the Drawings and Section 23 33 00 – Duct Accessories for where fan manufacturer may provide dampers and when specialty damper manufacturer must provide them.

H. Propeller Fans

1. Secure housing or sleeve to wall
2. Provide additional support from overhead construction or floor by steel rods or angles if fan extends more than approximately 24 inches from wall.

I. Roof Mounted Fans

1. Install on factory fabricated curbs

    a. Exception: Install Utility fans as indicated on the Drawings

2. See Division 7 Thermal and Moisture Protection for waterproofing and roofing.
3. Roof curbs

    a. Secured to structure with hold down methods as detailed
    b. Made fully weatherproof

J. Pipe scroll drains to code compliant waste receptacle

3.2 MOUNTING AND ALIGNMENT

A. See Section 23 05 48 – Mechanical Sound and Vibration Control

3.3 INSPECTION

A. Verify that adequate clearance between fans and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 PRE-OPERATING CHECKS

A. Before operating fans

1. See Section 01 91 00 – Commissioning
2. Complete the attached Pre-Functional Test Data Sheet, specification 23 08 00, for each fan

B. Do not operate fans for any purpose, temporary or permanent, until

1. Ductwork is clean
2. Filters in place
3. Bearings lubricated

3.5 TESTING AND ADJUSTING

A. Before starting fans

1. See Paragraph 3.4B
2. See Section 01 91 00 – Commissioning
3. Install belt and motor guards

B. Start and test fans in accordance with manufacturers written installation instructions.

C. Start up and adjust fans to insure proper operation.

D. The submitted sound power level shall be verified through actual measurements and calculations in accordance with AMCA standards 300 and 301.

1. In the event the sound power level data measured or being submitted exceeds the designed level, provide additional sound traps or other sound attenuating devices to supplement the design in order to comply with sound power level specifications. Perform this work, including the additional noise control and any increase in motors Hp and increase in electrical service at no additional cost to the Using Agency. Submit calculations or measurement results to the Professional, which substantiate that sound power level produced by the submitted equipment and any required sound attenuating devices do not exceed the specified sound power levels.

E. After starting fans: Check for objectionable noise or vibration. Correct as needed at no additional cost to the Using Agency.

F. Balancing: See Section 23 05 93 – Testing, Adjusting and Balancing

G. Commissioning: See Section 23 08 00 – Mechanical Commissioning

3.6 TRAINING

A. See Section 23 00 10 – Mechanical General Provisions and Section 23 08 00 – Mechanical Commissioning

END OF SECTION 23 34 00

SECTION 23 37 00 - AIR OUTLETS AND INLETS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following: All air outlets, inlets, grilles, registers and diffusers except where integral with manufactured piece of equipment

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

1.4 QUALITY ASSURANCE

A. Comply with ARI Standard 650 – Air Outlets and Inlets

B. Comply with ASHRAE Standard 70 – Methods of Testing for Rating the Airflow Performance of Outlets and Inlets

C. Comply with AMCA Standard 500 – Laboratory Methods of Testing dampers for Rating

D. Comply with NFPA Standard 90A – Installation of Air Conditioning and Ventilating Systems

E. Comply with BSR/NFPA 90B – Standard for the Installation of Warm Air Heating and Air Conditioning Systems

F. Provide outlets and inlets that have, as minimum, throw and noise criteria ratings for each size device as listed in manufacturer's current data, rated as required by the above standards.

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Grilles, registers, and diffusers	R			R
Accessories	R			

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Titus

C. Price

D. MetalAire

2.2 GENERAL

A. Manufacturer shall examine and approve of application of each outlet.

B. Noise level at design capacities: no larger than diffuser selection indicated on the drawings.

C. Volume dampers

1. Do not provide dampers built into grille or directly attached to the grille unless specifically called out on drawings or in this Section.
2. Volume damper key-operated adjustable from face of diffuser on register except as noted
3. Opposed blade

D. Diffuser frame

1. Frame type shall be coordinated with ceiling type. Refer to architectural reflected ceiling Drawings.
2. Plaster or drywall ceilings: lay-in diffuser with drywall frame (to allow for ceiling access through grille). Drywall frame to match diffuser color.
3. No visible screw allowed on diffusers or frames, unless otherwise indicated on the Drawings.

E. Outlets may be steel or aluminum unless otherwise indicated on the Drawings.

F. Color

1. Face and frame: Factory-baked #26 white enamel unless otherwise indicated on the Drawings

2. Internal parts of grille visible from occupied space, including all parts behind perforated face diffusers and visible parts of plenums: flat black

2.3 STYLES

A. General

1. See diffuser schedule on the Drawings for outlet style and size
2. Throw pattern per the Drawings
3. Specific frame, border, and other product references refer to Price Products
4. Provide square to round adapters where required

B. T-Bar Diffuser Price TBD375

1. Two (2) 3/4" slots
2. Extruded aluminum center T painted white.
3. External aluminum foil backed fiberglass insulation

C. Square Cone Diffuser Price SCD

1. 3 cones

D. Louvered Face Diffuser Price SMDA

1. Adjustable air pattern

E. Round Cone Diffuser Price RCD

1. 3-position adjustment
2. Removable inner assembly of cones that extend below the diffuser face
3. Air flow pattern, field adjustable

F. Double Deflection Supply Register Price 620

1. 3/4" blade spacing, fully adjustable.
2. Front set of blades shall run parallel with the short grille dimension.
3. Drywall frame with recessed screw holes.
4. Register with aluminum opposed blade damper.

G. Egg Crate Grille Price 80

1. 1/2" x 1/2" x 1/2" aluminum grid core.
2. Drywall frame with recessed screw holes.

H. Fixed Grille 45° Deflection Price 630

1. 3/4" blade spacing, fully adjustable.
2. Front set of blades shall run parallel with the short grille dimension.
3. Drywall frame with recessed screw holes.
4. Register with aluminum opposed blade damper.

2.4 SCREENED OPENINGS

A. Mesh

1. 3/4 in. square pattern
2. No. 16 galvanized wire
3. Interwoven
4. Welded or secured to frame

B. Frames:

1. 1 inch by 1 inch by 1/8 inch galvanized steel angles
2. Continuous around perimeter of screen (welded at corners)

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate with work of other trades.

B. Install air outlets and inlets in accordance with manufacturer's written installation instructions and Section 23 31 13 – Ducts.

C. Return and exhaust registers: Install with blades oriented to prevent sight through outlets.

D. Grille backs or plenums visible through grilles painted flat black

E. Transfer grilles

1. See indications on the Drawings
2. Wall installations, unless otherwise indicated, provide two grilles

a. One on each side of wall, except where open to return air plenum
b. Connecting sheet metal collar with 18 inch elevation offset for sound and light attenuation

F. Provide duct screens at termination ducts as indicated on the Drawings

3.2 MOUNTING AND ALIGNMENT

A. See Section 23 05 48 – Mechanical Sound and Vibration Control

B. All air outlets and inlets shall be secured to building

1. Ceiling grilles shall be secured to prevent falling from ceiling during construction or service with minimum of two 16-gage ceiling wires, two 22-gage by 1 inch galvanized sheet metal strap or two #10 sheet metal screws.
2. Comply with IBC

C. Mount directional grilles as indicated on the Drawings.

D. Adjust grille throw patterns

1. As indicated on the Drawings

2. For double-deflection grilles, adjust rear blades horizontal and front blades in 45 degree pattern at each end gradually rotating to be almost straight at blades in center of grille.
3. Prior to test and balance

3.3 INSPECTION

A. Verify mounting, direction and adjustments are installed as indicated on the Drawings.

3.4 TESTING AND ADJUSTING

A. See Section 01 91 00 – Commissioning

B. See Section 23 05 93 – Testing, Adjusting and Balancing

C. See Section 23 08 00 – Mechanical Commissioning

END OF SECTION 23 73 00

SECTION 23 40 00 - AIR CLEANING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 WORK INCLUDED

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Filter media
2. Filter frames in built-up systems

B. Related Sections

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.3 REFERENCE STANDARDS

A. ASHRAE Standard 52.1-1992 – Gravimetric and Dust Spot Procedures for Testing Air Cleaning Devices Used in General Ventilation for Removing Particulate Matter

B. ASHRAE Standard 52.2-1999 – Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size

C. ANSI/UL 900 – Test Performance of Air Filter Units

1.4 QUALITY ASSURANCE

A. All filters shall be dust-spot rated in accordance with ASHRAE/ANSI Standard 52.1 – Atmospheric Dust Spot Method.

B. Filters shall have MERV ratings in accordance with ASHRAE Standard 52.2-1999 – Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size.

1.5 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop

drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Filters	R			
Filter frames	R			
Filter gauges	R	R		

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Filter Media and Frames

1. Camfil/Farr Filtration Group
2. Flanders/Precisionaire
3. American Air Filter
4. Or equal

2.2 FILTERS

A. General

1. Underwriters' Laboratories as Class 2
2. Disposable type
3. Each filter shall consist of media, media support grid and enclosing frame.

B. Type 1: Pleated Filter

1. 2 inch or 4 inch pleated
2. Media: Cotton & synthetic media (no polyester)
3. Minimum performance:

    a. 25 percent to 30 percent dust spot efficiency, complying with ASHRAE 52.1
    b. MERV 8, complying with ASHRAE 52.2

4. Maximum initial pressure drop at 500 feet per minute face velocity shall not to exceed 0.3 inches water column. Final pressure drop shall be no less than 1.0 inch water column.
5. Equal to Camfil/Farr Aeropleat IV

C. Type 2: Cartridge Filter

1. Media assembled in compact enclosing frame

2. Minimum depth: 12 inches as indicated on the Drawings
3. Enclosing frame

    a. Galvanized steel
    b. Media support contour stabilizers mechanically fastened to diagonal support members.

4. Media

    a. Microfine glass (no polyester)
    b. Mechanically and chemically bonded within the frame to prevent air bypass

5. Minimum performance

    a. 80 percent to 85 percent dust spot efficiency, complying with ASHRAE 52.1
    b. MERV 13 complying with ASHRAE 52.2
    c. 90 percent to 95 percent dust spot efficiency complying with ASHRAE 52.1
    d. MERV 14 complying with ASHRAE 52.2

6. Maximum initial pressure drop at 500 feet per minute face velocity shall not to exceed 0.5 0.7 inches water column. Final pressure drop shall be no less than 1.0 inch water column.
7. Equal to Camfil/Farr Riga-Flo

D. Type 3: Bag Filters

1. Deep pleated replaceable element
2. Minimum depth: 30 inches as indicated on the Drawings
3. Enclosing frame

    a. Galvanized steel frame and galvanized steel pocket retainers
    b. Header bonded to the media to prevent air bypass

4. Media

    a. Lofted microfine glass (no polyester)
    b. Chemically bonded to permeable media support backing

5. Minimum performance

    a. 80 percent to 85 percent dust spot efficiency complying with ASHRAE 52.1
    b. MERV 13 complying with ASHRAE 52.2
    c. 90 percent to 95 percent dust spot efficiency complying with ASHRAE 52.1
    d. MERV 14 complying with ASHRAE 52.2

6. Maximum initial pressure drop at 500 feet per minute face velocity shall not to exceed 0.4 0.55 inches water column. Final pressure drop shall be no less than 1.0 inch water column.
7. Equal to Camfil/Farr Hi-Flo

E. Type 4: HEPA Filters

1. Filter depth of 12 inches
2. Wetlaid water-resistant microfine glass media
3. Performance: Filters shall be capable of maintaining rated efficiency at 275 FPM face velocity with initial pressure drop of 1.0 inch and final pressure drop of 2.0 inches.
4. UL 900 Class I listed
5. Rating: (99.97)(99.99) percent efficiency on 0.3 microns based on IES RP-1 requirements

6. Frame: 20-gage galvanized steel or extruded aluminum with 3/4-inch wide by 1/4-inch thick closed cell neoprene gasket
7. Testing: Each filter shall be individually tested and certified to have a penetration of no more than 0.3 percent and a resistance of no more than 1.0 inch water column at 500 feet per minute velocity in accordance with Military Standard 282. The filter shall be so certified on a permanently affixed label. A letter of certification shall accompany each filter.

2.3 FRAMES

A. For air handlers and fan-coils, see individual specifications Sections.

B. Field-Built Bag Filter Frames

1. 16 gage galvanized steel
2. Hardware and fasteners zinc plated
3. Prefilter tracks
4. Closed cell foam gasket and woven pile barrier shall provide seal for installed filters
5. Filter holding brackets
6. Front access

2.4 FILTER GAUGE

A. See Section 23 09 00 – Energy Management & Control Systems (DP sensors with LCD display).

B. Differential pressure type

C. Accurate to 2 percent of full range

D. Sensing probes and shut off valves for each gauge port

E. Field adjustable to 2 inches water gauge

F. Dwyer 2000 Magnehelic gauge or equal

PART 3 - EXECUTION

3.1 FILTER MEDIA

A. Media as selected in equipment schedules on the Drawings

B. Construction filters

1. Type 1 for all equipment; roll media not acceptable

3.2 INSTALLATION

A. Factory installed in air handling equipment

B. Coordinate with work of other trades

C. Install Air Cleaning Devices in accordance with manufacturer's written installation instructions.

D. Filter gauges:

1. Required only for filters with MERV 8 and greater and on systems greater than 2000 cfm.
2. Install filter gauge to filter or AHU housing in a position where reading will be visible but not block maintenance access.
3. Mount probes on upstream and downstream side of filter and pipe to gauge ports with soft copper tubing per gauge manufacturer's instructions.

E. See Section 23 09 00 – Energy Management & Control Systems

F. See Section 23 05 93 – Testing, Adjusting and Balancing

G. See Section 23 08 00 – Mechanical Commissioning

3.3 START-UP PROCEDURES

A. Do not operate air handling unit fan systems for any reason until spaces served have been cleaned of dust and debris, to avoid contamination of supply air or return air paths and equipment.

B. Supply fans shall not be operated unless filters are installed, including temporary filters for use during test and balance.

C. If the final pressure drop of the temporary filters is reached during test and balance, replace them with a spare set.

D. Immediately before turning system over to Using Agency, remove temporary construction filters and install clean final filters. See also Section 23 05 93 – Testing, Adjusting and Balancing and Section 23 00 10 – Mechanical General Provisions for media installation during test and balance.

3.4 INSPECTION

A. Verify that adequate clearance between Air Cleaning Devices and adjacent walls or equipment is available to permit maintenance and replacement of filters.

B. Verify that filters are firmly seated in frame to minimize bypass.

3.5 TRAINING

A. See Section 23 00 10 – Mechanical General Provisions and Section 23 08 00 – Mechanical Commissioning

END OF SECTION 23 40 00

SECTION 23 54 00 - FURNACES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Condensing furnaces and accessories complete with controls.
2. Direct-expansion cooling coils with refrigerant piping.
3. Filter housing for furnaces.

B. Related Sections include the following:

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods
4. Section 23 23 00 – Refrigerant Piping

1.3 DEFINITIONS

A. Condensing Furnace: Furnace with annual fuel utilization efficiency rating more then 88 percent; designed to vent saturated flue gas.

B. CPVC: Chlorinated polyvinyl chloride.

C. PVC: Polyvinyl chloride.

1.4 SUBMITTALS

A. See Section 23 00 10 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Furnace	R	R		R
Furnace controls	R	R		
Furnace accessories	R	R		R

C. Product Data: For each furnace. Include rated capacities of selected models; shipping, installed, and operating weights; furnished specialties; and accessories. Include plan and elevation views of units, minimum clearances, and data on ratings and capacities.

D. Wiring Diagrams: Power, signal, and control wiring.

E. Operation and Maintenance Data: For each furnace to include in emergency, operation, and maintenance manuals.

F. Warranties: Special warranties specified in this Section.

1.5 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of furnaces and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace the following components of furnaces that fail in materials or workmanship within specified warranty period:

1. Furnace heat exchanger.
2. Control circuit board.

B. Warranty Period: 10 years from date of Final Completion for both heat exchangers in each furnace. Five (5) years limited parts warranty.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

2.2 GAS-FIRED CONDENSING FURNACES

A. Acceptable Manufacturers:

1. Lennox
2. Trane
3. York

B. Description: Factory assembled, piped, wired, and tested; complying with ANSI Z21.47, "Gas-Fired Central Furnaces," and NFPA 54, "National Fuel Gas Code"; and bearing label of American Gas Association.

C. Convertible from upflow, to horizontal with left or right airflow

D. Single wire twinning

E. Cabinet: Steel, with interior insulation around heat exchanger. Lift-out panels expose burners and all other items requiring access for maintenance.

1. Interior Insulation: Mineral-fiber board thermal insulation manufactured with glass fibers a minimum of 1/2 inch thick, bonded with a thermosetting resin. Comply with ASTM C 612, Type IB, with aluminum foil jacket.
2. Hinged blower door

F. Finish of External Casings and Cabinets: Factory painted, manufacturer's standard color.

G. Fan: Centrifugal, factory balanced, resilient mounted, direct drive.

H. Fan Motors: Constant torque Electrically Commutated Motor (ECM). See Section 23 05 13 – Motor and Controllers.

I. Type of Gas: Natural Gas (convertible to L.P.).

J. Heat Exchanger:

1. Primary: Stainless-steel tubing.
2. Secondary: Stainless-steel tubing with turbulators.

K. Burner Controls: Solid state; control gas valve and ignition with self-diagnostics.

1. Gas Valve: 24 V, 100 percent safety gas shutoff, pressure regulator, and manual shutoff.
2. Ignition: Electric pilot ignition, with electric spark igniter.

L. Automatic Controls: Solid-state board delays fan start and shutdown.

M. Accessories:

1. Concentric Combustion-Air Intake and Vent Termination: PVC plastic fitting to combine combustion-air inlet and vent through roof.
2. Condensate neutralizer kit.

2.3 CONTROLS

A. Furnace Controls: Include components required for satisfactory operation of furnaces and

auxiliary equipment in all seasons.

B. Control Transformer: 24-V ac output, factory installed, and wired in furnace.

C. Cooling Relay: To start condensing unit.

D. Blower Fan Control: Fan on-automatic.

E. See Section 23 09 00 – Energy Management and Control System (General) for additional control details.

2.4 FILTER HOUSING FOR FURNACES

A. Description: Factory assembled, side or top service housings, constructed of 18 gage galvanized steel with integral track to receive 2-inch filters.

B. Access Door: Continuous gasket on perimeter and locking device which does not require use of any tools to open or close.

C. Sealing: Size of housing shall match the size of the inlet of the furnace being served. Incorporate positive-sealing gasket material between furnace and filter housing and filter housing and return air plenum to prevent bypass of unfiltered air.

2.5 COOLING FEATURES

A. Evaporator Coil: Copper tubes mechanically expanded into aluminum fins. Comply with ARI 210/240, "Unitary Air-Conditioning and Air-Source Heat Pump Equipment." Match size with furnace. Match remote condensing unit specified in Section 23 81 14 - Condensing Units with type, capacity, pressure-drop ratings, restricted distributor, or expansion valve. Include condensate drain pan with accessible drain outlet.

B. Evaporator coil shall be constructed with 1/2 inch O.D. copper tube with 12 fins per inch of corrugated aluminum for maximum heat transfer. Maximum face velocity shall be less than 500 feet per minute.

C. Evaporator Coil Enclosure: Steel, matching furnace and evaporator coil, with access panel and flanges for integral mounting at or on furnace cabinet and non-corrosive (plastic or stainless steel) drain pan. Drain pan shall be double sloped for drainage. Properly sized and installed condensate drain trap is required and shall be furnished and piped by the installing contractor. Partial coil enclosures are not acceptable.

D. Thermal Expansion Device: Non-bleed thermal expansion valve or as recommended by manufacturer.

2.6 PLASTIC VENT MATERIALS

A. Provide with concentric vent kit.

B. CPVC Plastic, Schedule 40 Pipe: ASTM F 441/F 441M.

1. CPVC Plastic, Schedule 40 Fittings: ASTM F 438, socket type.
2. CPVC Solvent Cement: ASTM F 493.

C. PVC Plastic, Schedule 40 Pipe: ASTM D 1785.

1. PVC Plastic, Schedule 40 Fittings: ASTM D 2466, socket type.
2. PVC Solvent Cement: ASTM D 2564.

PART 3 - EXECUTION

3.1 FURNACE INSTALLATION

A. Install units level and plumb

B. Install gas-fired furnaces and associated fuel and vent features and systems according to NFPA 54

C. Control Wiring: Install control wiring as specified in Section 23 09 00 – Energy Management and Control System (General)

D. Identify furnaces according to Section 23 05 53 – Mechanical System Identification

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect gas piping according to Section 23 11 00 - Fuel Gas Piping

C. Vent and Outside-Air Connection, Condensing, Gas-Fired Furnaces: Connect plastic piping vent material to furnace connections and extend thru roof. Terminate vent outdoors with a concentric vent termination kit that protects against entry of birds, insects, and dirt.

1. Plastic pipe joint construction is specified in Section 23 05 00 - Basic Mechanical Materials and Methods.

D. Connect ducts according to Section 23 31 13 - Ducts

E. Install piping adjacent to machine to allow service and maintenance

F. Ground equipment according to Division 26.

G. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 MANUFACTURER’S FIELD SERVICE

A. Manufacture’s Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections.

1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
2. Verify bearing lubrication.
3. Verify proper motor rotation.
4. Test Reports: Prepare a written report to record the following:

    a. Test procedures used.
    b. Test results that comply with requirements.
    c. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

B. Tests and Inspections

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation

C. Remove and replace malfunctioning units and retest as specified above

D. Prepare test and inspection reports

3.4 ADJUSTING

A. Adjust initial temperature and humidity set points.

B. Set controls, burner, and other adjustments for optimum heating performance and efficiency. Adjust heat-distribution features, including shutters, dampers, and relays, to provide optimum heating performance and system efficiency.

3.5 CLEANING

A. After completing installation, clean furnaces internally according to manufacturer's written instructions.

B. Install new filters in each furnace prior to performing TAB work.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Using Agency’s maintenance personnel to adjust, operate, and maintain furnaces.

END OF SECTION 23 54 00

SECTION 23 55 23 - FUEL-FIRED RADIANT HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Gas-Fired Radiant Heaters

1.3 RELATED SECTIONS

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods

1.4 SUBM ITTALS

A. See Section 23 00 10 – Mechanical General Provisions.

B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. “R” means required.
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Radiant Heaters	R	R		R
Controls	R	R		
Accessories	R			

C. See Section 23 00 10 – Mechanical General Provisions

D. Product Data: Include rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories.

E. Shop Drawings:

1. Wiring Diagrams: Power, signal, and control wiring.

F. Field Quality-Control Test Reports: From Contractor.

G. Operation and Maintenance Data: For fuel-fired radiant heaters to include in emergency, operation, and maintenance manuals. Refer to Division 15 Section “Operation and Maintenance Data”.

E. Warranties: Special warranties specified in this Section.

1.4 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, with the experience and capability to conduct the testing indicated, as documented according to ASTM E 548.

B. Source Limitations: Obtain fuel-fired radiant heaters through one source from a single manufacturer.

C. Product Options: Drawings indicate size, profiles, and dimensional requirements of fuel-fired radiant heaters and are based on the specific system indicated. Refer to Division 1 Section "Product Substitutions".

D. Equipment shall be certified to the ANSI Z83.20 standard and bear the CSA certification label.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace heat exchanger of fuel-fired radiant heater that fails in materials or workmanship within specified warranty period.

B. Warranty Period: Five years from date of Final Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

B. Modine.

C. Reznor/Thomas & Betts.

D. Reverberray (Detroit Radiant Products Company)

2.2 GAS-FIRED, LOW INTENSITY INFRARED HEATERS

A. Description: Factory assembled, piped, and wired, and comp lying with ANSI Z83.6, "Gas-Fired Infrared Heaters."

1. AGA Approval: Designed and certified by and bearing label of American Gas Association.
2. Type of Gas: Designed and built to burn natural gas with characteristics same as those of gas available at Project site.

B. Fuel type: Burner shall be designed for natural gas having characteristics same as those of gas available at project site.

C. Burner type: Unit shall be a positive pressure power burner with a combustion fan upstream of the burner and exhaust gases. Negative pressure (pull through) type appliances will not be allowed.

D. Burner: Stainless-steel venturi burner. The flame anchoring screen shall have a minimum temperature rating equivalent to 304 grade stainless steel. Non stainless steel burners shall not be permitted.

E. Gas control: Operation shall include a defined input differential. Heater must be CSA Design Certified to operate at an input differential of at least 30% between the low and nominal rated input modes.

F. Combustion chamber: shall be 4 inch O.D. 16ga. Titanium stabilized aluminized steel (150-200MBH to allow for the operating temperature to exceed the 1030F as set forth in the ANSI Z83.20 standard) or aluminized steel (below 150 MBH), finished with a high emissivity rated, corrosion resistant, black coating with an emissivity level documented at .92 or higher.

G. Emitter tube: shall be 4 inch O.D. 16ga. aluminized steel finished with a high emissivity rated, corrosion resistant, black coating with an emissivity level documented at .92 or higher.

H. Fan enclosure: Combustion fan shall be totally housed inside burner control box and not exposed.

I. Tube connections: The heater’s combustion chamber and radiant emitter tube shall incorporate a 4 inch slip-fit, interlocking connection in which the upstream tube slides into the next tube and is held by a bolted clamp.

J. Ignition system: Hot surface silicon carbide capable of temperatures achieving 2400 F. Ignitor shall be readily accessible and serviceable without the use of tools.

K. Reflectors: Shall be .025 polished aluminum with a multi-faceted design which includes reflector end caps. Reflector shall have a polished bright finish with clear visual reflection ability. (A sample will be required at time of submittal). Reflector shall have a minimum of 7 sheet metal bends in its fabrication to optimize downward radiation. Reflectors shall be rotatable from 0 to 45 degrees when required. The heater’s reflector hanging system shall be designed to permit expansion while minimizing noise and/or rattles.

L. Control box: Heater's exterior control chassis shall be constructed of corrosion resistant enameled steel.

1. The heater's top cover shall be constructed of ABS plastic material.
2. Air intake: An air intake collar shall be supplied as part of the burner control assembly to accept a 4 inch O.D. supply duct.
3. The heater's control compartment shall be accessible without the use of tools and serviceable while heater is operating.
4. Outdoor modifications are required for any application that will be placed in space defined as outdoors. The rating label shall bear the outdoor certification approval.

M. Heaters shall be equipped with a sight glass allowing a visual inspection of ignitor and burner operation from the floor.

N. The heaters shall utilize a downstream turbulator baffle for maximum heat transfer.

O. Heater shall be supplied with a stainless steel flexible gas connector.

P. Burner Safety Controls:

1. Heater controls shall include a safety differential pressure switch to monitor combustion air flow, as to provide complete burner shutdown due to insufficient combustion air or flue blockage.
2. The heater shall incorporate a self-diagnostic ignition module, and recycle the heater after an inadvertent shutdown.
3. The heater's control system shall be designed to shut off the gas flow to the main burner in the event either a gas supply or power supply interruption occurs.
4. The heater's blower motor shall be thermally protected and the motor's impeller shall be balanced.
5. Heater control assembly shall include three indicator lights that define the units operating input ranges. One indicator shall validate air flow. Two indicator lights shall indicate low and high stages.
6. The heater's air flow control system shall provide a 45 second pre-purge prior to initiating burner operation and a 90 second post-purge upon completion, effectively removing all products of combustion from heat exchanger and/or radiant tubes.
7. No condensation shall form as a result of combustion in the combustion chamber or radiant tubes while at operating temperatures.
8. Thermostat control shall be two-stage operating on 24 volts.

Q. Venting: shall be per manufacturer approval and specifications.

R. Accessories:

1. Wire grid for increased efficiency.
2. Protective screen.
3. Heat-deflector shield. (where scheduled)
4. Stainless-steel flexible connector with manual valve.
5. Hanger chain with "S" hooks.
6. Preassembled chain mounting kit.

2.3 TEMPERATURE CONTROL

A. Wires and cables are specified in Division 16 Section.

B. Sensors, Components, and Wiring: Specified in Section 23 09 00 – Energy Management and Control System (General)

C. Thermostat: 2-stage, digital programmable wall-mounting type with 50 to 90 deg F operating range.

D. Control Transformer: Integrally mounted.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for radiant heater piping systems to verify actual locations of piping connections before equipment installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Coordinate with work of other trades

B. Install fans in accordance with manufacturer’s written installation instructions.

C. Install radiant heaters level and plumb.

D. Install and connect gas-fired radiant heaters and associated fuel features and systems according to NFPA 54, applicable local codes and regulations, and manufacturer's written installation instructions.

E. Suspended Units: Suspend from substrate using chain hanger kits and building attachments.

F. Maintain manufacturers' published clearances to combustibles.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Gas Piping: Comply with applicable requirements in Section 23 11 00 - Fuel Gas Piping. Connect gas piping to gas train inlet; provide union with enough clearance for burner removal and service. Provide AGA-approved flexible units.

D. Electrical: Comply with applicable requirements in Division 26 Sections.

1. Install electrical devices furnished with heaters but not specified to be factory mounted.

E. Ground equipment according to Division 26 Section.

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections.

1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
2. Test Reports: Prepare a written report to record the following:

   a. Test procedures used.
   b. Test results that comply with requirements.
   c. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

3.5 ADJUSTING

A. Adjust initial temperature set points.

B. Adjust burner and other unit components for optimum heating performance and efficiency.

3.6 TRAINING

A. Engage a factory-authorized service representative to train Using Agency's maintenance personnel to adjust, operate, and maintain fuel-fired radiant heaters. Refer to Section 23 00 10 – Mechanical General Provisions.

END OF SECTION 23 55 23

SECTION 23 81 14 - CONDENSING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. These heating, ventilating and air conditioning (HVAC) provisions specified herein apply to all Sections of Division 23.

B. Refer to the General and Supplementary Conditions and Division 01 for special requirements and conditions which apply to all Sections of Division 23.

1.2 SUMMARY

A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:

1. Air-cooled condensing units.

B. Related Sections include the following:

1. Section 01 91 00 – Commissioning
2. Section 23 00 10 – Mechanical General Provisions
3. Section 23 05 00 – Basic Mechanical Materials and Methods
4. Section 23 21 12 – Heating and Cooling Piping

1.3 SUBMITTALS

A. See Section 23 00 10 Mechanical General Provisions

B. Submit product data, O&M data, and samples and show item on shop and coordination drawings (where shop and coordination drawings are required) according to the following table.

1. “R” means required
2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Condensing Units	R	R		R
Specialties	R	R		R
Accessories	R	R		R

1.4 QUALITY ASSURANCE

A. Listing and Labeling: Provide electrically operated equipment specified in this Section that is listed and labeled.

1. The Terms "Listed" and "Labeled": As defined in NFPA 70, Article 100.

B. Fabricate and label refrigeration system according to ASHRAE 15, "Safety Code for Mechanical Refrigeration."

C. Comply with NFPA 70.

D. Comply with UL 303, "Refrigeration and Air-Conditioning Condensing and Compressor Units."

1.5 COORDINATION

A. Coordinate size and location of concrete support pad. Concrete, reinforcement, and formwork requirements are specified in Division 03 Section "Cast-in-Place Concrete."

1.6 WARRANTY

A. General Warranty: The special warranty specified in this Article shall not deprive the Professional of other rights the Professional may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.

B. Special Warranty: A written warranty, executed by Contractor and signed by manufacturer, agreeing to replace components that fail in materials and workmanship within the specified warranty period, provided manufacturer's written instructions for installation, operation, and maintenance have been followed.

1. Warranty Period: Manufacturers standard, but not less than 5 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.

2.2 AIR COOLED CONDENSING UNITS (1 to 5 tons)

A. Acceptable Manufacturers:

1. Lennox
2. Trane
3. Johnson Controls

B. Description: Factory assembled and tested, air cooled; consisting of compressors, condenser coils, fans, motors, refrigerant reservoirs, and operating controls.

C. Refrigerant: R-410A

D. Compressor: Scroll compressor hermetically sealed and isolated for vibration.

1. Motor: Include thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
2. Thermostatically controlled sump heater
3. Roto lock suction and discharge refrigeration connections
4. Centrifugal oil pump
5. Low vibration and noise

E. Condenser: Aluminum-tube, aluminum-fin coil, with liquid subcooler.

1. Coil: 5/16 inch O.D. seamless aluminum
2. Fin: aluminum continuous glued to coil
3. Lab tested to withstand 2,000 psi
4. Protected on all sides by louvered panels

F. Condenser Fan: Direct-drive, aluminum propeller fan; with permanently lubricated fan motor with thermal-overload protection.

G. Accessories include the following:

1. Liquid line dryer
2. Anti-short cycle timer
3. Electro-mechanical high and low pressure controls
4. Rubber isolator kit
5. Evaporator defrost control
6. Low ambient kit to permit operation down to 30 °F
7. Crankcase heater
8. Automatic reset timer to prevent compressor rapid cycle
9. Hard start kit for single phase units
10. 3-leg, compressor - overload protection

H. Casing: Steel, finished with baked enamel; with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Mount service valves, fittings, and gage ports on exterior of casing.

I. Coil Guards: Coil guards shall be constructed of louvered steel panels or 16 gauge expanded galvanized steel as detailed on the drawings. Guard finish shall match that of the condensing unit.

2.3 AIR COOLED CONDENSING UNITS (6 to 25 tons)

A. Acceptable Manufacturers:

1. Lennox
2. Trane
3. Johnson Controls

B. Description: Factory assembled and tested, air cooled; consisting of compressors, condenser coils, fans, motors, refrigerant reservoirs, and operating controls.

C. Refrigerant: R-410A

D. Compressor: Hermetic scroll compressor(s) designed for service with crankcase sight glass, crankcase heater, and backseating service access valves on suction and discharge ports.

1. Single Compressor Units

a. Single circuit with integral subcooling circuit
b. Suction gas-cooler motor w/±10% voltage utilization range of unit nameplate voltage
c. Crankcase heater
d. Internal temperature and current sensitive motor overloads
e. Factory installed liquid line filter drier
f. Phase loss/reverse rotation monitor
g. Liquid line service valve with gauge port
h. Suction line service valve with gauge port
i. External high and low pressure cutout devices
j. Evaporator defrost control
k. Loss of charge protection

2. Dual Compressor Units

a. Two separate and independent refrigerant circuits, each circuit with integral subcooling circuit
b. Suction gas-cooler motors w/±10% voltage utilization range of unit nameplate voltage
c. Crankcase heaters
d. Internal temperature and current sensitive motor overloads
e. Factory installed liquid line filter driers
f. Phase loss/reverse rotation monitor
g. Liquid line service valves with gauge port
h. Suction line service valves with gauge port
i. External high and low pressure cutout devices
j. Evaporator defrost control
k. Loss of charge protection

E. Condenser: Seamless copper-tube, aluminum-fin coil, with separate and independent refrigeration circuit for each compressor. Include liquid accumulator and subcooling circuit and backseating liquid-line service access valve. Factory test coils at 600 psig, then dehydrate by drawing a vacuum and fill with a holding charge of nitrogen.

1. 3/8 inch internally enhanced copper tube mechanically boded to lanced aluminum plate fins
2. Provide with factory installed perforated steel hail guards

F. Condenser Fans: Propeller-type vertical discharge; direct driven. Include the following:

1. Permanently lubricated ball-bearing motors
2. Separate motor for each fan
3. Motors with thermal-overload cutouts
4. Dynamically and statically balanced fan assemblies
5. Low Ambient Control: Factory-installed damper assembly, fan-speed control, or fan-cycling control

G. Operating and safety controls include the following:

1. Manual reset, electromechanical low pressure and high pressure cutout switches
2. Low oil pressure cutout switch

3. Anti-short cycle timer
4. Modulating low ambient (operation down to 0 °F)
5. Compressor-winding thermostat cutout switch
6. Crankcase heater
7. 3-leg, compressor-overload protection
8. Control transformer
9. Magnetic contactors for compressor and condenser fan motors
10. Automatic, nonrecycling pump down and a timing device to prevent excessive compressor cycling

H. Unit Casings: Designed for outdoor installation with weather protection for components and controls and with removable panels for required access to compressors, controls, condenser fans, motors, and drives. Additional features include the following:

1. Steel, galvanized or zinc coated, for exposed casing surfaces, treated and finished with manufacturer's standard paint coating
2. Shall comply with ASTM B117, 672 hour salt spray test
3. Lifting lugs to facilitate rigging of units
4. Unit base provisions for forklift and/or crane lifting
5. Gasketed control panel door
6. Unfused disconnect switch, factory mounted and wired, for single external electrical power connection

I. Coil Guards: Coil guards shall be constructed of louvered steel panels or 16 gauge expanded galvanized steel as detailed on the drawings. Guard finish shall match that of the condensing unit.

J. Accessories include the following:

1. Vibration isolators
2. BACnet MS/TP communication interface

2.4 MOTORS

A. Refer to Section 23 05 13 - Motor and Controllers

B. Motor Construction: NEMA MG 1, general purpose, continuous duty, Design B.

2.5 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate condensing units according to ARI 210/240 for units smaller than 135,000 BTUH.

B. Testing Requirements: Factory test sound-power-level ratings according to ARI 270.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install condensing units according to manufacturer's written instructions.

B. Install units level and plumb, firmly anchored in locations indicated; maintain manufacturer's

recommended clearances.

C. Install ground-mounted units on 4-inch- thick, reinforced concrete base, 4 inches larger than condensing unit on each side or as indicated on Contract Drawings whichever is greater. Concrete, reinforcement, and formwork requirements are specified in Division 3. Coordinate installation of anchoring devices.

3.2 CONNECTIONS

A. Connect refrigerant piping to air-cooled condensing units; maintain required access to unit. Install furnished field-mounted accessories.

B. Ground equipment: Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Leak Test: After installation, charge systems with refrigerant and oil and test for leaks. Repair leaks and replace lost refrigerant and oil.

B. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation, product capability, and compliance with requirements.

1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units with new units and retest.

D. Field installed options shall be installed by factory authorized personnel in strict accordance with the manufacturer's instructions. Installation shall be inspected by a factory employed service representative and written approval provided to the Professional at substantial completion.

3.4 CLEANING

A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Clean units to remove dirt and construction debris and repair damaged finishes.

3.5 COMMISSIONING

A. Verify that units are installed and connected according to the Contract Documents.

B. Complete installation and startup checks according to manufacturer's written instructions and do the following:

1. Inspect for physical damage to unit casing.
2. Verify that access doors move freely and are weathertight.
3. Clean units and inspect for construction debris.
4. Check that all bolts and screws are tight.
5. Adjust vibration isolation and flexible connections.
6. Verify that controls are connected and operational.

C. Lubricate bearings on fans.

D. Verify that fan wheel is rotating in the correct direction and is not vibrating or binding.

E. Start unit according to manufacturer's written instructions.

1. Complete manufacturer's starting checklist.

F. Measure and record airflow over coils.

G. Check operation of condenser capacity control device.

H. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

I. After startup and performance test, lubricate bearings and adjust belt tension.

3.6 DEMONSTRATION

A. Startup Services: Engage a factory-authorized service representative to train Using Agency's maintenance personnel as specified below:
1. Train Using Agency's maintenance personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, and preventive maintenance.
2. Review data in the maintenance manuals. Refer to Section 23 00 10 - Mechanical General Provisions.
3. Schedule training with Using Agency, through Professional, in accordance with Section 23 00 10 - Mechanical General Provisions.

END OF SECTION 23 81 14

SECTION 26 05 11 - ELECTRICAL GENERAL AND WORK IN EXISTING FACILITIES

PART 1 – GENERAL

1.1 GENERAL

A. All work shall conform to the latest editions of the National Electrical Code (NEC) [National Fire Protection Association (NFPA) 70], the Standard for Electrical Safety in the Workplace (NFPA 70E), the Life-Safety Code (NFPA 101), the International Building Code, the Americans with Disabilities Act, and all other applicable federal, state, and local codes and regulations.

B. All work shall be performed in strict compliance with NFPA 70E. Submission of bid shall stand as an agreement by the Contractor to indemnify and hold harmless the Engineer and Owner from all liability related to damage and/or injury to personnel and equipment during the installation of the project.

C. The contract documents are schematic in nature and are intended to convey the intent of the electrical work to be performed on this project. Provide all material, labor, equipment, etc., necessary to provide complete and operable electrical systems.

D. The General Conditions, Supplementary Conditions, General Requirements, Information to Bidders, and all other parts of this set of Contract Documents are hereby adopted and are applicable to the Division 26, 27, and 28 Contractor.

1.2 SCOPE OF WORK

A. Visit site prior to bid. Devise a plan for installation of complete and operable electrical systems meeting the requirements and intent of the Contract Documents. Submission of Bid stands as evidence that the Contractor accepts the Contract Documents as sufficient and complete for the work to be performed. Notify the engineer at least two weeks prior to bid of any discrepancies between the Contract Documents and actual field conditions. No change orders will be granted due to existing conditions that could have been observed during a site visit.

B. Provide temporary power and lighting during construction. Coordinate with the General Contractor for the exact requirements.

C. Electrical switchgear and panelboard layouts are based on sizes of Square D equipment. Equipment manufactured by General Electric, Siemens, and Cutler Hammer are equally acceptable. However, the Electrical Contractor is responsible for selecting and furnishing gear that will fit in the spaces provided and shall be responsible for arranging the gear to meet the required code clearances. Regardless of the manufacturer, the Electrical Contractor shall provide a drawn-to-scale electrical layout with the equipment brochures for all rooms in which panelboards, motor control centers, switchboards, or switchgear are placed. The drawings shall include the work of all other trades including mechanical system piping, ductwork, sprinkler piping, etc. No conduits shall be installed until layouts have been approved.

D. Locate junction boxes, pull boxes, disconnects, and other equipment requiring access in such a manner that they are accessible at the end of construction. Notify the Architect where it is impossible to plan conduit routing or equipment placement in such a manner, and provide the necessary access panels in the ceiling or wall as required. The access panel type and style shall be subject to the Architect's approval. Employ a painter to provide the appropriate coatings as directed by the Architect.

E. Relocate, or recircuit, all electrical equipment, conduit, and circuitry conflicting with or obstructing work on this project. Where the electrical systems are owned by other entities, pay them to relocate, or recircuit, their facilities.

F. Arrange for connection of service to all electrical systems by the appropriate utility company. Coordinate completely with all utility company requirements even if they are different than the contract documents. If utility company requirements are different from the contract documents, notify the engineer at least ten days prior to bid. Pay all utility company charges necessary for installation and connection of service. **No change orders will be granted for utility company connection fees.**

G. Provide all necessary equipment, raceway, circuitry, fittings, lugs, terminations, labor, etc. and connect to all equipment and appliances requiring electrical connections furnished herein, by the Owner, or by other Contractors. Prior to ordering electrical equipment and roughing in for equipment furnished by the Owner or other Contractors, verify all connection types, connection locations, connection heights, voltages, number of phases, conductor sizes, disconnecting means, breaker sizes, etc. Furnish the proper electrical equipment for the equipment actually being supplied.

1.3 WORK IN EXISTING FACILITIES

A. All work shall be scheduled and coordinated through the General Contractor with the Owner. Provide necessary costs for all work during both normal and premium work hours in bid.

B. Provide continuous uninterrupted power to all existing facilities to remain during the entire construction process. Any required power outages must be scheduled and approved by the Owner in writing at least three days prior to the outage.

1.4 SCOPE OF WORK IN EXISTING FACILITIES

A. Prior to beginning work, survey existing electrical systems. Document, in writing, signed by the Owner any portions of existing systems that are not operating properly before construction begins. Any electrical systems found inoperable at the end of the construction process that has not been so documented shall be repaired at the end of construction.

B. Remove electrical equipment in areas being demolished and electrical equipment feeding other equipment being demolished. Remove raceways and circuitry back to the panel of origination. Where raceways are installed in inaccessible areas, remove conductors back to the panel of origination. Where circuits are not being completely demolished, remove conductors back to a junction box or other connection point outside of the renovated area and recircuit existing electrical equipment that is to remain as required. Where necessary, completely refeed existing electrical equipment that is to remain. It is the intent of this specification that all existing equipment to remain be left completely operable at the end of the construction process.

C. Survey existing panel board circuitry and provide new typewritten directories giving complete as-built circuitry information for all pane lboards affected by the construction on this project.

D. Where new circuit breakers are installed in existing equipment, the new circuit breakers shall be manufactured for installation in that equipment. The Amperes Interrupting Current (AIC) Rating shall equal the AIC rating of the existing equipment. A breaker with a lower AIC rating may be used if the contractor provides calculations showing that the breaker rating is sufficient to handle the available fault current. Submit these calculations for approval prior to ordering the breaker. An AIC rating on an existing breaker in the panelboard or switchboard does not

demonstrate sufficient proof that the available fault current is less than that breaker's AIC rating.

1.5 SUBMITTALS AND SHOP DRAWINGS

A. Within 30 days after award of Contract and prior to beginning work, provide six bound copies of manufacturers' cut sheets containing information concerning each article of electrical equipment to be furnished on this project. These cut sheets shall contain sufficient information to prove compliance with the contract documents. Information addressing the requirements of the contract documents shall be highlighted. Each bound set shall bear the stamp of the Electrical Contractor as well as the General Contractor.

B. Within 30 days after award of Contract and prior to beginning work, provide six sets of full size shop drawings showing exact equipment locations with all equipment drawn to scale. Show all raceways with their junction boxes and pull boxes. Show all connection types, locations, and heights to equipment. Provide mounting and support details for all raceways and equipment. Coordinate with all other trades to ensure that there are no conflicts between systems. Each set of shop drawings shall bear the stamp of the Electrical Contractor, the General Contractor, and all Project Sub-Contractors. Failure to submit these Shop Drawings will render the Electrical Contractor responsible for resolving all conflicts between trades at his own expense.

C. Submittals and Shop Drawings are reviewed to determine quality of materials. Approval of submittals and shop drawings does not relieve the Contractor of meeting the requirements and intent of the Contract Documents.

D. Outlet, light fixture, and device locations are shown in their approximate locations on the drawings. Coordinate with Architectural drawings to get final locations. Mount all electrical outlets shown at counters such that the bottom of the box is two inches above the backsplash or six inches above a counter with no backsplash. The Owner reserves the right to relocate outlets, light fixtures, and devices a distance not to exceed twenty feet prior to the installation of outlet boxes.

PART 2 - PRODUCTS

2.1 All electrical equipment and materials shall be new. All equipment and materials shall be stored on the job site in weatherproof enclosures. Electronic equipment shall be stored in facilities where the temperature and humidity are controlled. In addition, comply completely with all manufacturers' requirements for storage and handling.

2.2 All equipment shall be UL listed for the application in which it is used and shall be labeled as evidence of its UL listing.

2.3 Each circuit breaker supplying a multiwire branch circuit shall be installed with a manufacturer supplied handle tie to simultaneously disconnect all ungrounded conductors. Each multi-wire branch circuit shall comply with NEC article 210.4.

2.4 Products shall be selected to maintain or improve the aesthetics of the facility. Gain approval of the Architect or Engineer prior to ordering or installing any electrical equipment or raceway.

PART 3 – EXECUTION

3.1 WORKMANSHIP

All work shall be performed with an emphasis on neatness. The Engineer, Architect, and Owner retain the right to reject work that is, in their judgment, unsatisfactory.

3.2 EXPERIENCE

The Contractor shall have completed at least two jobs of similar size and scope within the past five years. The Engineer reserves the right to reject Contractors based on their inability to submit evidence of their experience, or based on experience with the Contractor on previous projects.

3.3 PERMITS

Obtain and pay for all permits required for work.

3.4 FIREPROOFING

A. Fireproof all penetrations through firewalls with a fireproofing compound listed to maintain the rating of the wall through which the raceway passes.

B. The fire-stopping caulk shall be a one-part, intumescent, latex elastomer. The caulk shall be capable of expanding a minimum of 3 times at 1000°F. The material shall be thixotropic and be applicable to overhead, vertical and horizontal fire-stops. The caulk shall be listed by independent test agencies such as UL or FM and be tested to, and pass the criteria of, ASTM E 814 Fire Test, tested under positive pressure. It shall comply with the requirements of the NEC (NFPA-70), BOCA, ICBO, SBCCI and NFPA Code 101. Fire-stopping caulk shall be paintable, but shall be non-hardening. Fire-stopping caulk shall be 3M Fire barrier CP or approved equal.

C. The fireproofing materials shall be installed by individuals certified to perform such work. Submit evidence of personnel certifications with electrical equipment brochures.

D. Where cable trays are shown crossing firewalls, terminate the cable tray on each side of the wall and run the conductors through conduits installed in the wall. Fireproof around the conductors after installation.

E. Provide mineral wool packing and all other materials recommended by the manufacturer for a complete installation.

3.5 FLASHING

Provide all necessary equipment and flash all roof penetrations in such a manner to ensure that all penetrations are completely sealed and all roof warranties remain in effect. Where there are no roof warranties, the Electrical Contractor shall guarantee the electrical penetrations against leaking for a period of one year from project completion. Employ a professional roofing contractor to perform all flashing.

3.6 PROTECTION

A. Keep energized equipment covered during all phases of construction. Use enclosures, doors, covers, etc., to ensure that neither personnel nor machinery contact live electrical equipment.

B. Replace electrical equipment that is damaged during construction.

3.7 DAMAGED FACILITIES

A. Locate all existing site equipment and utilities prior to beginning construction. Repair all equipment and utilities damaged during construction, or pay for the repair of the equipment and utilities where required by the Owner of the damaged facilities.

B. Coordinate the routing of all circuits and the locations of all devices with the Architect or Engineer and the Owner. Shop drawings shall describe completely the locations and elevations of all raceways, boxes, fittings, and equipment.

3.8 EXCAVATION AND BACKFILL

A. Excavate in such a manner as to minimize erosion of the soil. Backfill trenches around conduits with fine sand that is free of rocks, clods, and debris. Fill sand a minimum of 4" over conduits. Backfill the rest of the trench in six inch increments, wetted, and tamped. Final compaction shall be a minimum of 95% of that of the adjacent earth. Resurface the grade with the same material as that excavated from the grade whether it be paving, concrete, sod, etc. Repair work shall be comparable to the quality of the original site prior to excavation.

B. Provide a 3" wide plastic labeled marker tape 12" below grade over all electrical conduits buried underground. Tapes for power circuits shall have a warning such as "Caution: Buried Electrical Line Below." Labels on tapes for telephone, data, cable television, and other facilities shall adequately describe the line over which they are buried.

C. Provide a #12 AWG wire in each buried conduit run labeled accordingly on each end.

3.9 IDENTIFICATION

A. Label all switchboards, panel boards, motor starters, disconnects, and motor control centers furnished under Division 26, 27, and 28 and other divisions of this contract with engraved rigid plastic nameplates having letters at least ¼ inch high. Nameplates shall be bolted to the enclosure. All labels shall indicate the voltage, number of phases, the AIC rating, and the panelboard and circuit number from which the device is fed.

B. All circuit breakers in Switchboards, Motor Control Centers, Square D I-Line, and similar pane lboards shall be labeled with plastic nameplates (as described in Part A) providing the name of the load served and the ampacity and number of poles of the breaker.

C. All Square D NQOD, NF and similar panel boards shall have typewritten circuit directories.

D. Label all conductors at all junction boxes, pull boxes, and terminations with typewritten adhesive markers indicating the panel board or switchboard name and circuit number of the conductor. Labels shall be Brady Datatab or approved equal.

E. Label all junction boxes and pull boxes with stenciled painted letters containing the name of the panel board and circuit numbers of the circuits contained within. Use black paint for normal circuits, red paint for emergency circuits, and orange paint for fire alarm circuits. The Contractor may select other colors for junction boxes and pull boxes for auxiliary systems.

F. Label all conduits in the most likely direction of access and view every 50' and on both ends of each bend with stenciled painted letters containing the name of the panel board and circuit numbers of the circuits contained within. Use black paint for normal circuits, red paint for emergency circuits, and orange paint for fire alarm circuits. The Contractor may select other colors for conduits for auxiliary systems.

3.10 AS-BUILT DRAWINGS

Maintain one set of drawings during construction for as-built markings. Mark these drawings in red to indicate field changes. Provide these drawings to the Engineer at the end of the construction process. Where required under the General Conditions, Special Conditions, or other portions of this contract, provide revised computer drawn as-built drawings to the Engineer at the end of construction.

3.11 TESTING

A. Test all systems, or pay testing agencies as required, for compliance with the requirements of all regulatory agencies.

B. Test the electrical power service ground using a Biddle Three-Terminal Ground Resistance Tester, or approved equal. Grounds shall meet the requirements of the NEC, or of Specification 26 05 26, whichever is more stringent. Test grounds only when the earth is dry. Provide additional ground rods as necessary to achieve the required results.

C. Prior to making final equipment connections, test all service, feeder, and branch circuit conductors for continuity, phase-to-phase faults, and phase-to-ground faults using a Megger BM100 or approved equal test instrument generating 500 Vdc. Insulation resistance shall be a minimum of 500,000 Ohms between any conductor and ground and 1,000,000 Ohms between any two conductors.

D. Test other systems as required in their respective specifications.

E. Provide three bound copies of all test results to the Engineer at the end of the construction process. No Recommendation of Substantial Completion will be granted until all testing reports have been submitted.

3.12 WARRANTY

Provide the Owner a written guarantee to repair, or replace, all faulty equipment and systems for a period of one year from date of Substantial Completion. During this one-year period, a representative of the Contractor shall be on the site actively working on the repairs within 24 hours of the Owner’s telephone call. During this period of time, the Owner shall not be charged for any repair work or expenses related with the repair work unless the Contractor can prove that the Owner has damaged the equipment or system.

END OF SECTION

SECTION 26 05 19 – 600V CONDUCTORS

PART 1 – GENERAL

Provide all circuitry, terminations, splices, connectors, lugs, and other equipment necessary for connection of all equipment requiring electrical connections.

PART 2 – PRODUCTS

2.1 All electrical conductors shall be soft-drawn annealed copper having 98% conductivity and an insulation rating of 600V.

2.2 Conductors shall be UL listed for installation in the raceway in which they are to be installed.

2.3 Conductors shall be rated 90 degrees C for use in residential, commercial, industrial, and institutional facilities, and shall be listed as 105 degrees C appliance wire. Conductors shall be listed under UL 83, UL 1063, and UL 758. If XLP or EPR insulation is used, conductors shall be listed under UL 44 and NEMA WC7.

2.4 Conductors used for branch circuits, feeders, auxiliary systems, and controls run in dry locations shall have PVC insulation and a Nylon outer jacket. They shall be THHN/THWN or XHHW-2.

2.5 Conductors used for branch circuits, feeders, auxiliary systems, and controls run in wet locations shall have XLP or EPR insulation and be type XHHW-2.

2.6 Conductors used for operating room isolation panels and associated branch circuits shall be copper stranded conductor having a cross-linked polyethylene insulation or equivalent with a dielectric constant of 3.5 or less. Wire-pulling compounds that increase the dielectric constant shall not be used on the secondary conductors of isolation panels. The isolated circuit conductors shall be identified as follows:

Isolated Circuit #1 – Orange
Isolated Circuit #2 – Brown

For 125 volt, 15 & 20 ampere receptacles: The orange conductor shall be connected to the terminal on the receptacle that is identified in accordance with NEC 200.10(B) for connection to the grounded circuit conductor.

2.7 Conductors used for services shall be type SE for aerial services or type USE-2 for underground services.

2.8 Sizes #10 and #12 shall be solid conductors except where used for controls. All controls conductors shall be stranded.

2.9 Use minimum #14 AWG conductors for controls and auxiliary circuits. Use larger conductors as required to compensate for voltage drops exceeding 3% of the system voltage.

2.10 Conductors shall be furnished in the colors described below unless local ordinances require different colors. Conductors #8 and smaller shall be furnished with colored insulation; conductors larger than #8 shall be taped with the appropriately colored tape for a length of at least 2” at each panelboard, junction box, pull box, load, or other exposed location. Ground conductors shall be taped green for their entire exposed length.

SystemVoltage	208Y/120V, 3-Phase, 4-Wire	120/240V, 3-Phase, 4-Wire	480Y/277V, 3-Phase, 4-Wire

Phase A	Black	Black	Brown
Phase B	Red	Orange	Orange
Phase C	Blue	Blue	Yellow
Neutral	White	White	Gray
Ground	Green	Green	Green

2.11 Conductor sizing chart:

Voltage Drop Chart for 20amp single pole circuits		
Voltage	Circuit Length	Conductor size (awg)
120	< 90'	#12
120	> 90'	#10
120	> 145'	#8
120	> 230'	#6
277	< 200'	#12
277	> 200'	#10
277	> 325'	#8
277	> 525'	#6

A. Circuit sizes indicated on the drawings are minimum NEC requirements. Refer to this chart for upsizing conductors based on circuit length.
B. Do not connect conductors larger than #10 directly to a receptacle or a switch. Provide a junction box to downsize the conductor to #12 at the device.
C. For circuits longer than those listed above, consult with the Engineer for conductor sizes.

PART 3 – EXECUTION

3.1 Install conductors carefully using a minimum of two tradesmen – one feeding the conductors into the conduit, and the other pulling the conductors into the conduit.

3.2 Each branch circuit and multiwire branch circuit shall be run with its own neutral conductor complying with NEC article 200.4.

3.3 Join stranded conductors with appropriate mechanical or compression lugs. Wire nuts may be used for solid conductors only.

3.4 Splices shall only be made in approved enclosures. Splices shall not be pulled inside conduits.

3.5 Provide cable supports and strain relief connectors as required by the NEC.

3.6 Furnish junction boxes, pull boxes, handholes, manholes, etc. as required to ensure that the maximum number of bends allowed by the NEC are not exceeded and to ensure that the cables are not damaged during installation.

END OF SECTION

SECTION 26 05 26 – GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.1 GENERAL

Ground all equipment, systems, structures, etc., per the latest edition of the National Electrical Code (NEC).

PART 2 – PRODUCTS

2.1 Use mechanical bolted connections in dry locations that are accessible.

2.2 Use exothermic welds in wet locations and locations that will be inaccessible at the end of construction.

2.3 Ground rods shall be UL listed 3/4” x 10’ copper-clad steel ground rods with a minimum copper cladding thickness of 10 mils.

PART 3 – EXECUTION

3.1 Ground rods shall be installed with their tops no less than 6” below grade.

3.2 Bond ground connections to metal raceways at each end of the conduit run. Provide grounding bushings where required by the NEC. Where cable trays are used, bond the ground conductor to each section and fitting of the tray.

3.3 Provide all circuits with an equipment grounding conductor sized per the NEC, or as shown on the drawings. Circuitry shown on drawings does not include the required equipment grounding conductor. Where multiple circuits are run with a common neutral, only one equipment grounding conductor is needed. The equipment grounding conductor shall be furnished with green insulation for conductors #8 AWG and smaller; where larger than #8, the equipment grounding conductor shall be taped green for its entire exposed length.

3.4 The grounding electrode conductor(s) shall be bare or shall be colored green for its entire exposed length.

3.5 Individual ground conductors shall be installed in PVC conduit sized per the NEC.

3.6 Provide receptacles, luminaires, and other devices with a green conductor that bonds the receptacle grounding screw or pigtail, the outlet box grounding screw, and the equipment grounding conductor together.

3.7 In health care facilities, where two or more different panel boards serve the same patient-care area, an 8 AWG insulated continuous copper conductor shall bond these different panel boards together.

3.8 Telephone, cable television, and other auxiliary systems shall be bonded to the electrical building service ground using a conductor no smaller than #6 AWG.

END OF SECTION

SECTION 26 05 33 – RACEWAYS, OUTLET BOXES AND JUNCTION BOXES FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.1 GENERAL

A. All electrical systems circuitry shall be contained in raceways unless expressly listed in the specification for that system.

B. Outlet Boxes and Junction Boxes

1. Furnish and install all outlet boxes and junction boxes in accordance with this specification and the requirements of the NEC.

2. Provide outlet boxes for all switches, receptacles, luminaires, telephone jacks, cable jacks, and other devices furnished in this Contract. Provide all necessary hardware including, but not limited to, additional structural support, support brackets, screws, bolts, fixture studs, etc.

3. Outlet boxes and junction boxes in dry locations shall be galvanized stamped steel boxes sized per the latest edition of the National Electrical Code (NEC), but no less than 4” x 4” x 2 1/8” deep. The thickness of the steel shall be in compliance with the requirements of the NEC. Provide stamped steel covers for all junction boxes manufactured to fit the particular box on which it is used.

4. Outlet boxes used in concrete and masonry walls and ceilings shall be of the concrete type manufactured for such applications.

5. Outlet boxes and junction boxes in wet locations shall be of cast metal construction with gasketed waterproof covers. All conduit connections to the boxes shall be made watertight.

6. Wall outlet boxes shall be 4” x 4” x 2 1/8”, or larger as required, with plaster rings provided for final flush installation. Plaster rings shall have single-gang openings unless the equipment mounted inside requires two-gang installation.

7. Floor boxes in slabs on grade shall be deep rectangular, cast iron, fully adjustable boxes with brass rings. Covers shall be made of brass and shall provide flip top access to the power or data jacks inside. Screw-on covers are not acceptable unless a flip-top cover is unavailable for the device installed in the floor box. Provide the box sized as required for the number of devices shown installed. Boxes shall be as follows, or approved equal:

   a. Single-Gang Boxes: Hubbell B2436
   b. Single-Gang Cover Plates: Hubbell S3825
   c. Double-Gang Boxes: Hubbell B4233
   d. Double-Gang Cover Plates: Two Hubbell S3825 Cover Plates
   e. Triple-Gang Boxes: Hubbell B4333
   f. Triple-Gang Cover Plates: Three Hubbell S3825 Cover Plates

8. In slabs above grade, use cast iron, semi-adjustable shallow boxes as follows, or approved equal:

   a. Single-Gang Boxes: Hubbell B2414
   b. Two-Gang Boxes: Hubbell B4214
   c. Three-Gang Boxes: Hubbell B4314

9. Receptacles installed in floor boxes shall be as described in Specification 26 09 23, Switches and Receptacles. Data, Telephone, or Combination Data and Telephone Outlets shall consist of Category 5 rated RJ45 jacks mounted in a Hubbell DJOI strap for use under a S3825 flip top cover plate.

10. In existing slabs above grade, use poke thru boxes as follows, or equal:

    a. Hubbell System One

11. Size all boxes per the requirements of the latest NEC.

1.2 SCOPE OF WORK

A. Raceways

1. Provide all raceways, fittings, couplings, anchors, supports, hangers, etc. for complete raceway systems.

2. Use Schedule 40 polyvinyl chloride (PVC) conduit for circuits run underground and in slabs on grade level. Provide PVC-coated galvanized rigid steel elbows and PVC-coated galvanized rigid steel conduit for all vertical runs extending to a point at least 6” above grade. Galvanized Rigid steel conduit coated with two complete coats of asphaltum or bituminous paint may be used in lieu of PVC-coated galvanized rigid steel conduit.

3. Use Galvanized Rigid Steel (GRS) conduit for all applications where circuits are run above ground exposed to the weather.

4. Use Intermediate Metal Conduit (IMC) for all branch circuits, feeders, and auxiliary circuits requiring conduit 1 ¼” nominal trade size or larger in dry locations.

5. Use Electrical Metallic Tubing (EMT) for all branch circuits and feeders less than 1 ¼” nominal trade size in dry locations and in slabs above grade level.

PART 2 – PRODUCTS

2.1 Products for Raceways

A. PVC conduits, fittings, couplings, adapters, and accessories shall be UL listed and approved for use with 90 degree Celsius conductors. The UL label shall be affixed to each ten foot length of conduit and each fitting. Conduits shall comply with NEMA Specification TC-2 and UL 651. Fittings shall comply with NEMA TC-3 and UL 514b.

B. PVC-coated conduits, fittings, couplings, adapters, and accessories shall be UL listed with PVC as the primary corrosion protection. They shall be hot dipped galvanized rigid steel conduit with threads electro-galvanized after cutting. The conduit shall meet UL 6. The fittings shall meet UL 514B. The PVC coating shall be uniformly applied to the interior and exterior of all conduit and fittings. The coating shall be nominally 2 mils thick. The PVC coating shall extend one pipe diameter or two inches, whichever is less, at every male fitting except unions to fit over the joining female connection. Couplings shall contain a series of longitudinal ribs, 40 mils in thickness, to protect the coating from damage by tools during installation. PVC-coated conduits shall be ETL Verified PVC-001. Fittings shall be manufactured to the same standard. PVC-coated conduit shall be Robroy Plastibond or approved equal.

C. GRS conduits, fittings, couplings, adapters, and accessories shall be UL listed. They shall be hot-dipped galvanized steel. They shall meet the safety standards of UL 6, and shall be manufactured to ANSI C80.1. Threads shall be hot galvanized after cutting.

D. IMC conduits, fittings, couplings, adapters, and accessories shall be UL listed. They shall be hot-galvanized steel. Fittings, couplings, adapters, and accessories shall be the same as those for GRS conduit described above. IMC shall meet UL 1242 and ANSI C80.6. Threads shall be hot galvanized after cutting. The inside of the conduit shall be finished with a corrosion-resistant coating.

E. EMT conduits, fittings, couplings, adapters, and accessories shall be UL listed. They shall be hot galvanized steel and shall be produced in accordance with UL 797 and ANSI C80.3. The inside shall be finished with a corrosion-resistant lubricating coating.

F. Conduit fittings used with EMT conduits may be set screw indenter type or compression type. All metallic fittings for IMC and Rigid conduit shall be compression type fittings.

G. Flexible metallic conduit shall be constructed of galvanized steel and shall be UL listed as compliant with UL 1 and UL 1479.

H. Liquidtight flexible conduit shall be constructed of galvanized steel and shall be coated with a PVC jacket to resist liquids, dirt, grease, and oils. All fittings shall be designed, constructed, and installed to maintain the integrity of the liquidtight connections. Liquidtight flexible conduit shall comply with UL 360.

2.2 ACCEPTABLE MANUFACTURERS FOR OUTLET BOXES AND JUNCTION BOXES.

A. Outlet boxes and junction boxes shall be manufactured by Raco, Steel City, Crouse Hinds, or Appleton.

PART 3 – EXECUTION

3.1 CONDUIT EXECUTION

A. Conduits run underground shall be buried no less than 24” deep. Services and primary conduits feeding transformers shall be buried no less than 48” deep.

B. **Do not install conduits in or below ground floor slabs, except for service conduits, site lighting, and where specifically indicated on the drawings.**

C. Do not install conduits within 6” of the deck where a screw down type roof system is utilized.

D. PVC-coated conduits may be field-bent provided that manufacturer-approved tools are used. Individuals installing PVC-coated conduits shall be trained for installation by factory-certified trainers. Provide evidence of training with equipment brochures.

E. Support and install all conduits per the latest edition of the National Electrical Code. Support groups of conduits with electrical strut supported by threaded rods anchored to the building structure. Supports shall be designed to hold no less than twice the weight of the conduit and conductors to be supported plus an additional 250 pounds at midspan.

F. All conduits shall be grouped and run parallel to each other and to building walls.

G. All conduits shall be assembled according to the manufacturer’s instructions.

H. Conduits run underground shall be assembled to be watertight.

I. Cap all conduits during installation. Pull a mandrel sized for that conduit and a cleaning brush through each conduit before installation of any conductors.

J. Conduits that are obviously damaged and field bends that are obviously out of round shall be replaced.

K. Provide final connections to equipment with flexible metallic conduit. In wet or damp locations, use liquidtight flexible conduit. Flexible conduit shall not exceed 72".

L. Terminate conduits entering boxes with a locknut inside the box and a locknut outside the box. Provide protective bushings on all conduit threads. Use watertight hubs where conduit terminations are exposed to moisture.

M. Use grounding bushings on all feeder conduits, all underground conduits, and where required by the National Electrical Code.

N. Conduits shall be run no closer than 12" to hot water pipes.

O. Where conduits are run through the ceiling and are required to make connections to equipment within the room that is not located near a wall, support the conduit from the structural ceiling and provide a flange bolted to the floor. Install a tee conduit fitting in the vertical run of conduit, and make the connection to the equipment with a piece of flexible conduit extending from the tee conduit fitting to the equipment.

P. Provide expansion fittings where conduits cross building expansion joints. Provide grounding jumpers between the conduits.

Q. Provide EMT conduit sleeves where conduits pass through walls, floors, or footings sized a minimum of two nominal trade sizes larger than the conduit that must pass through the sleeve.

R. Equip all empty conduits with a pullwire or string capable of withstanding 200 pounds of pulling tension.

3.2 Execution for Outlet Boxes and Junction Boxes.

A. All devices shall be flush mounted unless specific written permission is obtained from the Engineer for a particular device in a particular location.

B. Install outlet boxes in walls, and provide plaster rings such that wall finish contractor's finish is flush against the edge of the plaster ring. Workmanship will not be accepted where the hole in the wall shows behind the cover plate, or the wall finish is uneven or unpainted at the edge of the cover plate.

C. Use round or square ceiling outlet boxes as required for the device being installed. The ceiling shall be finished flush against the box; the fixture shall completely cover the box and mount tight against the ceiling. Coordinate the requirements of the fixture prior to installing the box.

D. Provide junction boxes, pull boxes, and conduit fittings where required by the NEC to limit the number of bends in the raceway, and where required to prevent damage to conductors due to long runs.

E. Junction boxes and pull boxes installed in the ground outside shall be Quazite Composolite or approved equal. Mount the boxes over 24" of washed gravel fill. If splices are to be made inside

the boxes, the boxes shall be of the type furnished with a bottom, and all conduit connections shall be watertight. In addition, all conductor splices shall be made watertight using an appropriate splice kit as manufactured by 3M, or an approved equal.

END OF SECTION

SECTION 26 09 23 - SWITCHES AND RECEPTACLES

PART 1 – GENERAL

Furnish and install all switches and receptacles in accordance with this specification and the requirements of the NEC.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

Switches and receptacles shall be manufactured by Hubbell, Cooper Wiring Devices, Leviton, or Pass & Seymour.

2.2 GENERAL

A. Switches and receptacles shall be specification grade. They shall have ampacity and voltage ratings suitable for the application in which they are used.

B. Consult architect or engineer for device colors prior to ordering devices.

C. Provide brushed stainless steel cover plates for all devices. A single cover plate shall cover all devices in one box.

D. Light switches shall be 20 Ampere, 120-277V back-wired and side-wired toggle switches. They shall be rated up to 2 HP at 240V. Each switch shall be equipped with a grounding screw. Switches shall be Hubbell CSB series or approved equal.

E. Duplex NEMA 5-20R receptacles shall be Hubbell HBL 5362A or approved equal.

F. Duplex GFI NEMA 5-20R receptacles shall be Hubbell HBL GF5362A or approved equal.

G. Weatherproof while-in-use cover plates shall be Teddico #34017-7 or approved equal. Cover plates shall be single gang, lockable, and constructed of heavy duty die cast metal.

H. All 125V, 15 and 20 ampere receptacles installed in dwelling units shall be of the tamper-resistant type.

I. All 15 and 20 ampere, 125 and 250V non-locking receptacles installed in wet or damp locations shall be listed as the weather-resistant type.

J. Devices furnished in this Contract, but not listed above, shall be of the same standard of quality as those items listed.

PART 3 – EXECUTION

3.1 Flush mount all devices unless specific written permission is obtained from the Engineer for a particular device in a particular location.

3.2 Install all devices vertically unless the drawings specifically state that the particular device should be mounted horizontally.

3.3 Install receptacles with the ground slot up.

END OF SECTION

SECTION 26 09 25 - OCCUPANCY SENSORS

PART 1 - GENERAL

1.1 Furnish and install a complete system of Occupancy sensors as shown on the drawings and as specified herein. The drawings are provided to show the general scope of the work, and show the absolute minimum components required. Actual system components, quantities, and locations shall be determined by the motion detector vendor and provided to the Contractor with the installation shop drawings.

1.2 The Contractor and Sales Representatives are advised to take notice of specified component characteristics when attempting to select and propose substitutions. It is highly unlikely that substitutions on a one-for-one component basis will produce results that provide acceptable system performance.

1.3 Provide all power packs, hardware, software, devices, circuitry, and other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer.

1.4 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections.

1.5 The wiring diagrams on these drawings are based on our best interpretation of the manufacturer's data that was available at the time of design; however, they shall not be used for system installation and configuration. The controls equipment vendor is expected to be thoroughly knowledgeable of the equipment that is being proposed, and shall provide detailed shop drawings tailored for each circuit and lighting zone on the project. General manufacturer's data sheets shall not be acceptable. The shop drawings shall be suitable for the installing electrician to use for complete installation of the circuitry without referring to data sheets or installation manuals for connection of lighting control equipment. These requirements shall be followed whether the specified equipment, or products of other manufacturers, is provided.

PART 2 - PRODUCTS

2.1 Wireless Occupancy Sensor: Wireless occupancy sensors shall be passive infrared, ceiling-mounted units. They shall be Lutron #LRF2-OCR2B-P-WH or approved equal.

2.2 Areas up to 500 Square Feet: Occupancy sensors used in areas up to 500 square feet shall be dual technology infrared and microphonics, ceiling-mounted units with a 360 degree, 500 square foot coverage.

2.3 Areas up to 2000 Square Feet: Occupancy sensors used in areas up to 2000 square feet shall be dual technology infrared and microphonics, ceiling-mounted units with a 360 degree, 2000 square foot coverage. They shall be Lutron #LOS-CDT-2000-WH or approved equal.

2.4 Power Packs: Power packs shall be of the same manufacturer as the occupancy sensors. Each shall be capable of controlling a 20 ampere circuit. They shall be rated for operation at the voltage of the system on which they will be used.

2.5 Circuitry: Provide control circuitry as required by the manufacturer for optimum system operation, but no less than the following: Control cables shall be 3-conductor #22 AWG copper with an overall jacket. Adjust conductor sizes as required to overcome unacceptable voltage drop.

PART 3 - EXECUTION

3.1 Occupancy sensors shall be provided so that their coverage areas overlap and there are no dead zones in the rooms where persons may stand and not be detected.

3.2 All work shall be done by qualified system technicians.

3.3 Wiring, including control wiring, shall be in Raceways meeting Specification 16110.

3.4 Guarantee workmanship and material for a period of one year after final acceptance. During the warranty period, repair or replace faulty equipment at no cost to the Owner for labor, material, or expenses.

3.5 Upon completion of job, test entire system. After testing submit a certificate to the Architect stating verification of the following:

A. All devices have been tested and are working properly.

PART 4 – CLOSE-OUT DOCUMENTS

4.1 Provide the following documents to the Architect for delivery to the Owner at the time of substantial completion:

A. Written Guarantee
B. Two sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, a description of operation, shop drawings, wiring diagrams, maintenance procedures, and other literature required for operation and maintenance of equipment.

4.2 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written step-by-step instructional material.

4.3 Notify the General Contractor that you are to present during the Pre-final Inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels covers as required to show the quality of the installation. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 26 22 00 - TRANSFORMERS

PART 1 – GENERAL

Provide all equipment, labor, and materials required for complete and operable installation of transformers as shown on the drawings and specified herein.

PART 2 – PRODUCTS

2.1 Transformers 1000 KVA and smaller shall be listed by UL. They shall conform to the requirements of ANSI/NFPA 70. They are to be manufactured and tested in accordance with NEMA ST20.

2.2 Transformers shall be designed for operation at 60 Hz. Unless otherwise shown on the drawings, each transformer shall be a three-phase unit with a 480 volt, delta connected primary, and a 208Y/120 volt secondary.

2.3 Transformer shall be of the energy-efficient type.

2.4 Where transformers are shown on the drawings to be K-rated, they shall be UL listed and labeled for the K-rating indicated based on the sum of fundamental and harmonics per UL 1561. They shall be listed for 115 degrees C average temperature rise. K-rated transformers shall have an impedance of 3% to 5% with a minimum reactance of 2% in order to help reduce neutral current when supplying loads with large amounts of third harmonic current.

2.5 All insulating materials shall exceed NEMA ST20 standards and be rated for 220 degrees Celsius according to UL's component recognized insulation system.

2.6 Transformers 15 KVA and larger shall be rated for 150 degrees C temperature rise above an ambient temperature of 40 degrees C. Transformers 25 KVA and above shall have four 2.5% full capacity primary taps (two above and two below).

2.7 The maximum temperature of the top of the enclosure shall not exceed 50 degrees C above an ambient temperature of 40 degrees C.

2.8 Furnish transformers located outside with factory-furnished weatherproof enclosures.

2.9 Transformer coils shall be of continuous wound construction.

2.10 Transformer cores are to be visibly grounded to the enclosure by means of a flexible grounding conductor sized in accordance with applicable UL and NEC standards.

2.11 Transformers shall be ventilated and fabricated of heavy gauge sheet steel. The entire enclosure shall be finished utilizing a continuous process of degreasing, cleaning and phosphatizing, followed by electrostatic deposition of polymer polyester powder coating and baking to provide a uniform coating of all edges and surfaces.

2.12 Sound levels shall be warranted by the manufacturer not to exceed the following:

- 15 to 50 KVA – 45 dB
- 51 to 150 KVA – 50 dB
- 151 to 300 KVA – 55 dB
- 301 to 500 KVA – 60 dB
- 501 to 700 KVA – 62 dB

- 701 to 1000 KVA – 64 dB
- 1001 to 1500 KVA – 65 dB
- 1501 to 2000 KVA – 66 dB

PART 3 – EXECUTION

3.1 Install transformers in strict compliance with the manufacturer's instructions and the latest version of the National Electrical Code.

3.2 Provide concrete housekeeping pads for transformers mounted indoors. Housekeeping pads shall consist of 3.5" thick pads containing #4 reinforcing bars on 6" centers in both horizontal directions in the center of 3000 psi concrete. Where transformers are located outside, the pad shall extend at least 6" above grade and shall have a 12" wide footing at least 4" below the frost line; the footing shall be a minimum of 12" deep.

3.3 Transformers not exceeding 75 KVA may be wall-mounted where sufficient proof is provided that the structure can support the weight and where factory-provided wall brackets are used.

END OF SECTION

SECTION 26 24 00 - PANELBOARDS

PART 1 – GENERAL

1.1 Furnish and install all panelboards, complete with their circuit breakers, phase buses, neutral buses, ground buses, structural supports, and other equipment necessary for complete systems.

1.2 The equipment vendor shall perform all calculations necessary and provide complete Arc Flash Labels as required by the National Electrical Cod (NEC) and the drawings. Note: The drawings typically require more detail than required by the NEC.

PART 2 – PRODUCTS

2.1 GENERAL

A. Panelboards shall be designed, manufactured, and tested to be in compliance with NEMA PB 1, UL 50, UL 67, UL 489, NFPA 70, and the ASTM.

B. Circuit breakers shall be designed, manufactured, and tested to be in compliance with NEMA AB 1, UL 489, and Federal Specification W-C-375B/GEN.

C. Panelboards shall be UL listed for service entrance where used for that purpose.

D. Panelboard ampere interrupting current (AIC) ratings shall equal the lowest rated device in the panelboard. Provide panelboards with the AIC ratings shown on the Contract Drawings. Buses shall be braced to withstand the AIC rating shown on the drawings. Series ratings shall only be used where shown on the panelboard schedules.

E. All panelboards shall be furnished with dead-front, door-in-door construction.

F. Lug locations shall be determined during the creation of shop drawings for proper arrangement with the raceway system.

G. Buses shall be constructed of 98% conductivity copper or tin-plated copper.

H. Panelboard enclosures shall be NEMA 1 when they are to be mounted indoors, and NEMA 3R when they are to be mounted outdoors. Provide special enclosures where shown on the Contract Drawings.

2.2 ACCEPTABLE MANUFACTURERS

Panelboards shall be manufactured by Siemens, Square D, General Electric, or Cutler Hammer.

2.3 PANELBOARD CLASSES

A. Power distribution panelboards shall be available with mains and branch devices up to 1200 amperes. AIC ratings shall be available up to 200,000 Amperes. Power distribution panelboards shall be equipped with a nameplate containing the appropriate system voltage, number of wires, and number of phases for the system on which they are installed.

B. In 480Vac and less applications where a main breaker not exceeding 600 Amperes is required, the AIC rating does not exceed 65,000 Amperes, and no branch breakers exceed 125Amperes, Square D NF and equivalent panelboards may be used.

C. In 480Vac and less applications where a main breaker not exceeding 225 Amperes is required, the AIC rating does not exceed 14,000 Amperes, and no branch breakers exceed 100Amperes, Square D NEHB and equivalent panelboards may be used.

D. In 240Vac and less applications where a main breaker not exceeding 400 Amperes or main lugs not exceeding 600 Amperes is required, the AIC rating does not exceed 22,000 Amperes, and no branch breakers exceed 125 Amperes, Square D NQOD and equivalent panelboards may be used.

2.4 CIRCUIT BREAKERS

A. Circuit breakers shall be thermal magnetic, molded-case with quick-make, quick-break contact action. They shall have thermal and magnetic tripping elements on each pole. Breakers with multiple poles shall have common tripping of all poles. Circuit breaker ampere ratings shall be stamped on the handle. Interrupting ratings of the circuit breakers shall be equivalent to the specified AIC rating of the panelboard. Breakers handles shall reside in a position between “ON” and “OFF” after a trip condition. Breakers shall be rated HACR when used for heating, air-conditioning, and refrigeration; HID when used with High Intensity Discharge fixtures; and shall be rated SWD when used for switching duty.

B. Circuit breaker sizes for motor loads are based on Square D recommendations for use of their breakers at the motor horsepowers listed on the mechanical drawings. If equipment is used other than Square D, adjust breaker sizes per the manufacturer’s recommendations.

C. Each circuit breaker supplying a multiwire branch circuit shall be installed with a manufacturer supplied handle tie to simultaneously disconnect all ungrounded conductors. Each multiwire branch circuit shall comply with NEC article 210.4.

D. Circuit breakers with slash ratings, such as 120/240V or 480Y/277V, shall be used in solidly grounded systems where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the breaker’s voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker’s voltage rating.

E. Circuit breakers with straight voltage ratings, such as 240V or 480V, shall be used in systems other than solidly grounded systems (Corner-Grounded Delta, Ungrounded, Impedance Grounded, etc.) where the nominal voltage between any two conductors does not exceed the circuit breaker’s voltage rating. A two-pole circuit breaker shall not be used to protect a three-phase, Corner-Grounded Delta system unless the circuit breaker is marked 1Φ-3Φ.

PART 3 – EXECUTION

3.1 Install panelboards in complete compliance with all manufacturers’ installation instructions.

3.2 Install conductors neatly in panelboards. Group and tie-wrap circuits that share a common neutral.

3.3 Number circuits exactly as shown on the contract drawings.

END OF SECTION

SECTION 26 28 00 - DISCONNECTS AND SEPARATELY-MOUNTED CIRCUIT BREAKERS

PART 1 – GENERAL

Furnish and install all disconnects and separately mounted circuit breakers as shown on the drawings, specified herein, and required by the NEC.

PART 2 – PRODUCTS

2.1 GENERAL

A. Disconnects shall be of the heavy-duty type, and shall be UL listed for service entrance use. They shall meet or exceed the requirements of NEMA Standard KS1. Provide fuses sized to appropriately protect the load served. Equipment manufacturer's recommendations shall take precedence over the Contract Drawings.

B. Fuses shall be dual element, time-delay, Class J fuses. They shall be Bussman Low-Peak or approved equal.

C. Circuit breakers shall be thermal magnetic, molded-case with quick-make, quick-break contact action. They shall have thermal and magnetic tripping elements on each pole. Breakers with multiple poles shall have common tripping of all poles. Circuit breaker ampere ratings shall be stamped on the handle. Interrupting ratings of the circuit breakers shall be equivalent to the specified AIC rating of the panelboard. Breakers handles shall reside in a position between "ON" and "OFF" after a trip condition. Breakers shall be rated HACR when used for heating, air-conditioning, and refrigeration; HID when used with High Intensity Discharge fixtures; and shall be rated SWD when used for switching duty.

D. Circuit breaker sizes for motor loads are based on Square D recommendations for use of their breakers at the motor horsepowers listed on the mechanical drawings. If equipment is used other than Square D, adjust breaker sizes per the manufacturer's recommendations.

E. Circuit breakers with slash ratings, such as 120/240V or 480Y/277V, shall be used in solidly grounded systems where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the breaker's voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker's voltage rating.

F. Circuit breakers with straight voltage ratings, such as 240V or 480V, shall be used in systems other than solidly grounded systems (Corner-Grounded Delta, Ungrounded, Impedance Grounded, etc.) where the nominal voltage between any two conductors does not exceed the circuit breaker's voltage rating. A two-pole circuit breaker shall not be used to protect a three-phase, Corner-Grounded Delta system unless the circuit breaker is marked 1Φ-3Φ.

G. Disconnect and individually-mounted circuit breaker ampere interrupting current (AIC) ratings shall equal the rating of the panelboard from which they are fed unless otherwise noted.

H. Buses shall be constructed of 98% conductivity copper or equivalently rated aluminum.

I. Switches shall be horsepower rated where used to serve motors.

J. Enclosures shall be NEMA 1 when they are to be mounted indoors, NEMA 3R when they are to be mounted outdoors, and NEMA 4X where they are subject to washdown. Provide special enclosures where shown on the Contract Drawings.

2.2 ACCEPTABLE MANUFACTURERS

Disconnects and separately-mounted circuit breakers shall be manufactured by Siemens, Square D, General Electric, or Cutler Hammer.

PART 3 – EXECUTION

3.1 Install disconnects and individually-mounted circuit breakers in complete compliance with all manufacturers' installation instructions. Where necessary, provide structural supports and bracing for installation.

3.2 Disconnects are to be surface-mounted.

3.3 Individually-mounted circuit breakers are to be flush-mounted unless otherwise shown.

END OF SECTION

SECTION 26 36 23 – AUTOMATIC TRANSFER SWITCHES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes transfer switches rated 600 V and less, including the following:

1. Automatic transfer switches

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, weights, operating characteristics, furnished specialties, and accessories.

1. Technical data on all major components of all transfer switches and other products described in this section. Data is required for the transfer switch mechanism, control system, cabinet, and protective devices specifically listed for use with each transfer switch. Include steady state and fault current ratings, weights, operating characteristics, and furnished specialties and accessories.

2. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.

B. Shop Drawings: Dimensioned plans, elevations, sections, and details showing minimum clearances, conductor entry provisions, gutter space, installed features and devices, and material lists for each switch specified.

1. Dimensioned outline drawings of assembly, including elevations, sections, and details including minimal clearances, conductor entry provisions, gutter space, installed features and devices and material lists for each switch specified.
2. Internal electrical wiring and control drawings.
3. Interconnection wiring diagrams, showing recommended conduit runs and point-to-point terminal connections to generator set.
4. Installation and mounting instructions, including information for proper installation of equipment to meet seismic requirements.

C. Manufacturer and Supplier Qualification Data

1. The transfer switch manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.
2. The manufacturer of this equipment shall have produced similar equipment for a minimum period of 10 years. When requested, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

D. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Features and operating sequences, both automatic and manual.
2. List of all factory settings of relays, timers and protective devices; provide setting and calibration instructions where applicable.

E. Warranty documents demonstrating compliance with the project's contract requirements.

1.4 QUALITY ASSURANCE

A. Only approved bidders shall supply equipment provided under this contract.

B. Manufacturer Qualifications: The equipment supplier shall maintain a service center capable of providing training, parts, maintenance and emergency repairs to equipment, including transfer switch generator sets and remote monitoring equipment (if applicable) at the site within a response period of less than twenty-four (24) hours from time of notification.

1. The transfer switch shall be serviced by technicians employed by, and specially trained and certified by, the generator set supplier and the supplier shall have a service organization that is factory-certified in both generator set and transfer switch service. The supplier shall maintain an inventory of critical replacement parts at the local service organization, and in service vehicles. The service organization shall be on call 24 hours per day, 365 days per year.
2. Submit names, experience level, training certifications, and locations for technicians that will be responsible for servicing equipment at this site.
3. The manufacturer shall maintain model and serial number records of each transfer switch provided for at least 20 years.

C. Source Limitations: All transfer switches are to be obtained through one source from a single manufacturer. The generator set manufacturer shall warrant transfer switches to provide a single source of responsibility for products provided.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked as suitable for use in emergency, legally required or optional standby use as appropriate for the connected load.

E. The automatic transfer switch installation and application shall conform to the requirements of the following codes and standards:

1. Transfer switches and enclosures shall be UL 1008 listed and labeled as suitable for use in emergency, legally required, and optional standby applications.
2. CSA 282, Emergency Electrical Power Supply for Buildings, and CSA C22.2, No. 14-M91 Industrial Control Equipment
3. NFPA 70, National Electrical Code. Equipment shall be suitable for use in systems in compliance with Articles 700, 701 and 702.
4. Comply with NEMA ICS 10-1993 AC Automatic Transfer Switches
5. IBC 2006 – The transfer switch(es) shall be prototype-tested and third-party certified to comply with the requirements of IBC group III or IV, Category D/F. The equipment shall be shipped with the installation instructions necessary to attain installation compliance
6. IEEE 446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications
7. EN55011, Class B Radiated Emissions and Class B Conducted Emissions
8. IEC 1000-4-5 (EN 61000-4-5); AC Surge Immunity
9. IEC 1000-4-4 (EN 61000-4-4) Fast Transients Immunity
10. IEC 1000-4-2 (EN 61000-4-2) Electrostatic Discharge Immunity

11. IEC 1000-4-3 (EN 61000-4-3) Radiated Field Immunity
12. IEC 1000-4-6 Conducted Field Immunity
13. IEC 1000-4-11 Voltage Dip Immunity
14. IEEE 62.41, AC Voltage Surge Immunity
15. IEEE 62.45, AC Voltage Surge Testing

F. Comply with NFPA 110 – Emergency and Standby Power Systems. The transfer switch shall meet all requirements for Level 1 systems, regardless of the actual circuit level.

G. The manufacturer shall warrant the material and workmanship of the transfer switch equipment for a minimum of one (1) year from registered commissioning and start-up, or eighteen (18) months from date of shipment.

H. The warranty shall be comprehensive. No deductibles shall be allowed for travel time, service hours, repair parts cost, and etc. during the minimum noted warranty period described above.

1.5 COORDINATION

A. Size and location of concrete bases and anchor bolt inserts shall be coordinated. Concrete, reinforcement and formwork must meet the requirements specified in Division 03. See section 3.1 for additional information on installation

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cummins Power Generation
2. Russelectric
3. ASCO

B. Equipment specifications for this Project are based on automatic transfer switches manufactured by Cummins Power Generation. Switches manufactured by Russelectric or ASCO that meet the requirement of this specification are acceptable, if approved not less than two weeks before scheduled bid date. Proposals must include a line-by-line compliance statement based on this specification.

C. Transfer switches utilizing molded case circuit breakers do not meet the requirements of this specification and will not be accepted.

2.2 GENERAL TRANSFER-SWITCH PRODUCT REQUIREMENTS

A. Provide transfer switches in the number and ratings that are shown on the drawings. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer.

B. Fault-Current Closing and Withstand Ratings: UL 1008 WCR ratings must be specifically listed as meeting the requirements for use with protective devices at installation locations, under specified fault conditions. Withstand and closing ratings shall be based on use of the same set of contacts for the withstand test and the closing test.

C. Solid-State Controls: All settings should be accurate to +/- 2% or better over an operating temperature range of - 40 to + 60 degrees C (- 40 to + 140 degrees F).

D. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.41. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.

E. Electrical Operation: Accomplished by a non-fused, momentarily energized solenoid or electric motor operator mechanism, mechanically and electrically interlocked in both directions (except that mechanical interlock is not required for closed transition switches).

F. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.

1. Switches using molded-case switches or circuit breakers, or insulated case circuit breaker components are not acceptable.
2. Transfer switches shall be double-throw, electrically and mechanically interlocked, and mechanically held in the Source 1 and Source 2 positions.
3. Main switch contacts shall be high-pressure silver alloy. Contact assemblies shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.
4. Contacts shall be operated by a high-speed electrical mechanism that causes contacts to open or close within three electrical cycles from signal.
5. The transfer switch operation shall include the ability to switch to an open position (both sources disconnected) for the purpose of load shedding from the generator set.
6. The power transfer mechanism shall include provisions for manual operation under load with the enclosure door closed. Manual operation may be electromechanical or mechanical, but must be coordinated with control function.
7. Transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with components that could be operating at line voltage levels.
8. The transfer switch shall include the mechanical and control provisions necessary to allow the device to be field-configured for operating speed. Transfer switch operation with motor loads shall be as is recommended in NEMA MG1.
    a. Phase angle monitoring/timing equipment is not an acceptable substitute for this functionality
9. Transfer switches designated on the drawings as “4-pole” shall be provided with a switched neutral pole switched which is switched simultaneously with phase poles.
10. Transfer switches designated on the drawings as “3-pole” shall have a full current-rated neutral bar with lugs.
11. Transfer switches designated on the drawings as “isolation-bypass” switches shall meet the requirements of section 2.4 of this specification.
12. Transfer switches designated on the drawings as “non-automatic” switches shall meet the requirements of section 2.5 of this specification.
13. Transfer switches designated on the drawings as “closed transition” switches shall meet the requirements of section 2.6 of this specification.
14. Transfer switches designated on the drawings as “service entrance” switches shall meet the requirements of section 2.7 of this specification.

G. Control: Transfer switch control shall be capable of communicating with the genset control, other switches and remote programming devices over a high-speed network interface.

H. Factory wiring: Transfer switch internal wiring shall be composed of pre-manufactured harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plug(s), to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism

I. Terminals: Terminals shall be pressure type and appropriate for all field wiring. Terminal arrangement and cabinet space must be such that feeder conductors can enter from the top, side or bottom of the switch, at the installer's discretion. Control wiring shall be equipped with suitable lugs, for connection to terminal strips.

J. Enclosures: All enclosures shall be third-party certified for compliance to NEMA ICS 6 and UL 508, unless otherwise indicated:

1. The enclosure shall provide wire bend space in compliance to the latest version of NFPA70, regardless of the direction from which the conduit enters the enclosure.
2. Exterior cabinet doors shall provide complete protection for the system's internal components. Doors must have permanently mounted key-type latches. Bolted covers or doors are not acceptable.
3. Transfer switches shall be provided in enclosures that are third party certified for their intended environment per NEMA requirements.

    a. Transfer switches mounted in a controlled indoor environment shall be provided in NEMA Type 1 enclosures (IEC type IP30).
    b. Transfer switches installed indoors shall be NEMA Type 12 (IEC type IP61) if the Project environment requires dust-proof and/or drip-proof equipment.
    c. Transfer switches located outdoors shall be supplied in NEMA Type 3R (IEC IP34) when dust-proof and/or rain-proof enclosures are required.
    d. Transfer switches that are installed outdoors or in any other uncontrolled environment shall be supplied with NEMA Type 4 or 4X (stainless steel) enclosures (IEC IP65).

2.3 AUTOMATIC TRANSFER SWITCHES

A. Comply with requirements for Level 1 equipment according to NFPA 110.

B. Indicated current ratings:

1. Refer to the Project drawings for specifications on the sizes and types of transfer switch equipment, withstand and closing ratings, number of poles, voltage and ampere ratings, enclosure type, and accessories.
2. Main contacts shall be rated for 600 VAC minimum.
3. Transfer switches shall be rated to carry 100% of rated current continuously in the enclosure supplied, in ambient temperatures of -40 to +60 degrees C (-40 to +140 degrees F), relative humidity up to 95% (non-condensing), and altitudes up to 10,000 feet (3000 meters).

C. Manual Switch Operation: The power transfer mechanism shall include provisions for manual operation under load with the enclosure door closed. Manual operation may be electromechanical or mechanical, but must be coordinated with control function

D. Relay Signal: Control shall include provisions for addition of a pre-transfer relay signal, adjustable from 0 to 60 seconds, to be provided if necessary for elevator operation, based on equipment provided for the project.

E. Control: Transfer switch control shall be provided with necessary equipment and software to communicate with the genset control, other transfer switches, remote annunciation equipment, and other devices over a high speed control network.

F. Neutral Switching: Transfer switches designated on the drawings as 4-pole shall be provided with a switched neutral pole. The neutral pole shall be of the same construction and have the same ratings as the phase poles. All poles shall be switched simultaneously using a common crossbar. Substitute equipment using overlapping neutral contacts is not acceptable.

G. Transfer switches that are designated on the drawings as 3-pole shall be provided with a neutral bus and lugs. The neutral bus shall be sized to carry 100% of the current designated on the switch rating.

H. The transfer switch physically located closest to the generator and not more than 50 ft (15 meters) away, except those served by generator paralleling equipment, shall be provided with a battery charger suitable for the requirements of the application and in compliance with NFPA 110 requirements for Level 1 systems. If no transfer switch is located within this distance, a battery charger shall be installed on the generator set.

I. Automatic Transfer Switch Control Features

1. The transfer switch control system shall be configurable in the field for any operating voltage level up to 600 VAC. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions that are not field configurable are not acceptable.
2. All transfer switch sensing shall be configurable from an operator panel or from a Windows XP or later PC-based service tool. Designs utilizing DIP switches or other electromechanical devices are not acceptable.
3. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device for load shedding purposes. On receipt of this signal, the transfer switch shall switch to a neutral position when connected to Source 2. If Source 1 is available when the load-shed signal is received, the transfer switch shall connect to Source 1.
4. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device to prevent transfer to the generator service.
5. The transfer switch shall provide a relay contact signal prior to transfer or re-transfer. The time period before and after transfer shall be adjustable in a range of 0 to 50 seconds.
6. The control system shall be designed and prototype tested for operation in ambient temperatures from - 40 degrees C to + 60 degrees C (- 40 to +140 degrees F). It shall be designed and tested to comply with the requirements of the noted voltage and RFI/EMI standards.
7. The control shall have optically isolated logic inputs, high isolation transformers for AC inputs and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.
8. The transfer switch network monitoring equipment, when supplied, shall be provided with a battery-based auxiliary power supply to allow monitoring of the transfer switch when both AC power sources are non-operational. The battery power supply shall be monitored for proper condition, and the transfer switch shall include an alarm condition to indicate low battery condition.

J. Transfer Switch Control Panel: The transfer switch shall have a microprocessor-based control with a sealed membrane panel incorporating pushbuttons for operator-controlled functions, and LED lamps for system status indicators. The panel shall also include an alphanumeric display for detailed system information. Panel display and indicating lamps shall include permanent labels.

1. The indicator panel LEDs shall display:
   a. Which source the load is connected to (Source 1 or Source 2)

b. Which source or sources are available
c. When switch is not set for automatic operation, because the control is disabled or the bypass switch is in use
d. When the switch is in test/exercise mode

2. The indicator shall have pushbuttons that allow the operator to activate the following functions:
   a. Activate pre-programmed test sequence
   b. Override programmed delays, and immediately go to the next operation
   c. Reset the control by clearing any faults
   d. Test all of the LEDs by lighting them simultaneously

3. The alphanumeric digital display shall be vacuum fluorescent-type, clearly visible in both bright sunlight and no-light conditions over an angle of 120 degrees, and shall display the following:
   a. AC voltage for all phases, normal and emergency
   b. Source status: connected or not connected.
   c. Load data, including voltage, AC current, frequency, KW, KVA, and power factor.

4. The display panel shall be password-protected, and allow the operator to view and make adjustments:
   a. Set nominal voltage and frequency for the transfer switch
   b. Adjust voltage and frequency sensor operation set points
   c. Set up time clock functions
   d. Set up load sequence functions
   e. Enable or disable control functions including program transition
   f. View real-time clock data, operation log (hours connected, times transferred, failures) and service history

K. Control Functions: Functions managed by the control shall include:

1. Software adjustable time delays:
   a. Engine start (prevents nuisance genset starts in the event of momentary power fluctuation): 0 to 120 seconds (default 3 sec)
   b. Transfer normal to emergency (allows genset to stabilize before load is transferred): 0 to 120 seconds (default 3 sec)
   c. Re-transfer emergency to normal (allows utility to stabilize before load is transferred from genset): 0 to 30 minutes (default 3 sec)
   d. Engine cooldown: 0 to 30 minutes (default 10 min)
   e. Programmed transition: 0 to 60 seconds (default 3 sec)

2. Undervoltage sensing: three-phase normal, three-phase emergency source.
   a. Pickup: 85 to 98% of nominal voltage (default 90%)
   b. Dropout: 75 to 98% of nominal voltage (default 90%)
   c. Dropout time delay: 0.1 to 1.0 seconds (default 0.5 sec)
   d. Accurate to within +/- 1% of nominal voltage

3. Over-voltage sensing: three-phase normal, three-phase emergency source.
   a. Pickup: 95 to 99% of dropout setting (default 95%)
   b. Dropout: 105 to 135% of nominal voltage (default 110%)
   c. Dropout time delay: 0.5 to 120 seconds (default 3 sec)
   d. Accurate to within +/- 1% of nominal voltage

4. Over/under frequency sensing:
   a. Pickup: +/- 5 to +/-20% of nominal frequency (default 10%)

b. Dropout: +/-1% beyond pickup (default 1%)
c. Dropout time delay: 0.1 to 15.0 seconds (default 5 sec)
d. Accurate to within +/- 0.2%

5. Voltage imbalance sensing:
   a. Dropout: 2 to 10% (default 4%)
   b. Pickup: 90% of dropout
   c. Time delay: 2.0 to 20 seconds (default 5 sec)

6. Phase rotation sensing:
   a. Time delay: 100 msec

7. Loss of single-phase detection:
   a. Time delay: 100 msec

L. Control features shall include:

1. Programmable genset exerciser: A field-programmable control shall periodically start the generator, transfer the load to generator for a preset time, then re-transfer and shut down the generator after a preset cool-down period.

   a. Push-button programming control shall have a selection of eight different schedules for exercising generator, with or without load.

2. In event of a loss of power to the control, all control settings, real-time clock setting and the engine start-time delay setting will be retained.
3. The system continuously logs information including the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. An event recorder stores information, including time and date-stamp, for up to 50 events.
4. Transfer Override Switch: Overrides automatic re-transfer control so automatic transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light to indicate override status.

M. Control Interface

1. Provide one set Form C auxiliary contacts on both sides, operated by transfer switch position, rated 10 amps 250 VAC.
2. The transfer switch shall be provided with a network communication card, and configured to allow network-based communication with the transfer switch and other network system components, including the generator set(s) provided for the Project.
3. Unassigned Auxiliary Contacts: Two normally open, 1-pole, double-throw contacts for each switch position, rated 10A at 240 VAC.

N. Engine Starting Contacts
1. One isolated and normally closed, and one isolated and normally open; rated 10A at 32 VDC minimum.

2.4 SERVICE ENTRANCE TRANSFER SWITCHES

A. Transfer switches must be specifically intended for service entrance applications, and labeled “Suitable for service entrance use only”
B. Transfer switch shall meet NEC requirements for emergency, legally required and standby applications as specified in UL 1008.

C. Entire transfer switch including enclosure must be listed and labeled to UL 1008; switches with only the mechanism listed are not acceptable.
D. Molded case circuit breaker must be UL 489 listed.

2.5 REMOTE ANNUNCIATOR SYSTEM

A. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches. Annunciation shall include the following:

1. Sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
2. Switch position.
3. Switch in test mode.
4. Failure of communication link.

B. Annunciator Panel: LED-lamp type with audible signal and silencing switch.

1. Indicating Lights: Grouped for each transfer switch monitored.
2. Label each group, indicating transfer switch it monitors, location of switch, and identity of load it serves.
3. Mounting: Flush, modular, steel cabinet, unless otherwise indicated.
4. Lamp Test: Push-to-test or lamp-test switch on front panel.

C. Malfunction of annunciator, annunciation and control panel, or communication link shall not affect functions of automatic transfer switch. In the event of failure of communication link, automatic transfer switch automatically reverts to stand-alone, self-contained operation.

D. Automatic transfer-switch sensing, controlling, or operating function shall not depend on remote panel for proper operation. The remote annunciation system shall not prevent transfer to the alternate source when the primary power source fails, nor prevent return to the primary source if the alternate source fails

PART 3 - EXECUTION

3.1 INSTALLATION

A. Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

B. Floor-Mounting Switch: Anchor to floor by bolting.

1. Floor-mounted transfer switches (except drawout switches supported by wheeled carriages, which must be rolled out at floor level) shall be mounted on concrete bases complying with the following requirements:

a. Concrete Bases: 4 inches (100 mm) high, reinforced, with chamfered edges. Extend base no more than 4 inches (100 mm) in all directions beyond the maximum dimensions of switch, unless otherwise indicated or unless required for seismic support. Construct concrete bases according to Division 26 Section "Hangers and Supports for Electrical Systems."

B. Annunciator and Control Panel Mounting: Flush in wall, unless otherwise indicated.

C. Identify components according to Division 26 Section "Identification for Electrical Systems."

D. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

3.2 CONNECTIONS

A. Wiring to Remote Components: Match type and number of cables and conductors to control and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.

B. Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

C. Transfer switch shall be provided with AL/CU mechanical lugs sized to accept the full output rating of the switch. Lugs shall be suitable for the number and size of conductors shown on the drawings.

D. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

E. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.3 SOURCE QUALITY CONTROL

A. Prior to shipping, factory shall test and inspect components, assembled switches, and associated equipment to ensure proper operation.

B. Factory shall check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements.

C. Factory shall perform dielectric strength test complying with NEMA ICS 1.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: The supplier of the transfer switch(es) and associated equipment shall inspect, test, and adjust components, assemblies, and equipment installations, including connections, and report results in writing.

B. Manufacturer’s representative shall perform tests and inspections and prepare test reports.

C. After installing equipment and after electrical circuitry has been energized, installer shall test for compliance with requirements.

1. Perform recommended installation tests as recommended in manufacturer’s installation and service manuals.
2. After energizing circuits, demonstrate interlocking sequence and operational function for each switch.

    a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
    b. Verify time-delay settings.
    c. Verify that the transfer switch is accurately metering AC voltage and current (when provided).

d. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
e. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

3. Ground-Fault Tests (if integral to transfer switch): Coordinate with testing of ground-fault protective devices for power delivery from both sources.

a. Verify grounding connections and locations and ratings of sensors.

D. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.

1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
3. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 DEMONSTRATION

A. After generator set installation, the generator and transfer switch supplier shall conduct a complete operation, basic maintenance, and emergency service seminar covering generator set and transfer switch equipment, for up to 10 people employed by the Owner.

1. The seminar shall include instruction on operation of the transfer equipment, normal testing and exercise, adjustments to the control system, use of the PC based service and maintenance tools provided under this contract, and emergency operation procedures.
2. The class duration shall be at least 8 hours in length, and include practical operation with the installed equipment.

3.6 SERVICE AND SUPPORT

A. The manufacturer shall supply the Owner with a complete set of the service and maintenance software required to support the product. The software shall be provided at a training class attended by the user, to qualify the user in proper use of the software. The software shall have the following features and capabilities:

1. The software shall be 32 bit and shall be XP and Vista compatible.
2. The software shall use the Windows Explorer format, for ease of use and commonality with other software in use at the facility.
3. The software shall allow adjustment of all functions described herein, adjustment of operating levels of all protective functions, and programming of all optional functions in the controller. Adjustments shall be possible over modem from a facility that is remote from the generator set.
4. The software shall be capable of storing and displaying data for any function monitored by the generator set control. This data shall be available in common file formats, and on graphical “strip chart” displays.
5. The software shall automatically record all control operations and adjustments performed by any operator or software user, for tracking of changes to the control.

6. The software shall display all warning, shutdown, and status changes programmed into transfer switch controller. For each event, the control shall provide information on the nature of the event, when it last occurred, and how many times it has occurred.

END OF SECTION

SECTION 26 43 00 - SURGE PROTECTIVE DEVICES (SPDs)

PART 1 – GENERAL

1.1 SCOPE

A. The Contractor shall furnish and install the Surge Protective Device (SPD) equipment having the electrical characteristics, ratings, and modifications as specified herein and as shown on the contract drawings. To maximize performance and reliability and to obtain the lowest possible let-through voltages, the ac surge protection shall be integrated into electrical distribution equipment such as switchgear, switchboards, panelboards, busway (integrated within bus plug), or motor control centers. Refer to related sections for surge requirements in:

1.2 RELATED SECTIONS

A. Section 26 24 00 – Panelboards

1.3 REFERENCES

A. SPD units and all components shall be designed, manufactured, and tested in accordance with the latest applicable UL standard (ANSI/UL 1449 3rd Edition).

1.4 SUBMITTALS – FOR REVIEW/APPROVAL

A. The following information shall be submitted to the Engineer:

1. Provide verification that the SPD complies with the required ANSI/UL 1449 3rd Edition listing by Underwriters Laboratories (UL) or other Nationally Recognized Testing Laboratory (NRTL). Compliance may be in the form of a file number that can be verified on UL's website or on any other NRTL's website, as long as the website contains the following information at a minimum: model number, SPD Type, system voltage, phases, modes of protection, Voltage Protection Rating (VPR), and Nominal Discharge Current (I_n).
2. For sidemount mounting applications (SPD mounted external to electrical assembly), electrical/mechanical drawings showing unit dimensions, weights, installation instruction details, and wiring configuration.

B. Where applicable the following additional information shall be submitted to the engineer:

1. Descriptive bulletins
2. Product sheets

1.5 SUBMITTALS – FOR CONSTRUCTION

A. The following information shall be submitted for record purposes:

1. Final as-built drawings and information for items listed in Section 1.04 and shall incorporate all changes made during the manufacturing process

1.6 QUALIFICATIONS

A. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

B. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

D. The SPD shall be compliant with the Restriction of Hazardous Substances (RoHS) Directive 2002/95/EC.

1.7 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer's instructions. One (1) copy of manufacturer's instructions shall be included with the equipment at time of shipment.

1.8 OPERATION AND MAINTENANCE MANUALS

A. Operation and maintenance manuals shall be provided with each SPD shipped.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Eaton Cutler-Hammer

The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Engineer ten (10) days prior to bid date.

2.2 VOLTAGE SURGE SUPPRESSION – GENERAL

B. Electrical Requirements

1. Unit Operating Voltage – Refer to drawings for operating voltage and unit configuration.
2. Maximum Continuous Operating Voltage (MCOV) – The MCOV shall not be less than 125% of the nominal system operating voltage.
3. The suppression system shall incorporate thermally protected metal-oxide varistors (MOVs) as the core surge suppression component for the service entrance and all other distribution levels. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may crowbar the system voltage leading to system upset or create any environmental hazards.
4. Protection Modes – The SPD must protect all modes of the electrical system being utilized. The required protection modes are indicated by bullets in the following table:

	Protection Modes			
Configuration	L-N	L-G	L-L	N-G
Wye	●	●	●	●
Delta	N/A	●	●	N/A
Single Split Phase	●	●	●	●
High Leg Delta	●	●	●	●

5. Nominal Discharge Current (I_n) – All SPDs applied to the distribution system shall have a 20kA I_n rating regardless of their SPD Type (includes Types 1 and 2) or operating voltage. SPDs having an I_n less than 20kA shall be rejected.
6. ANSI/UL 1449 3rd Edition Voltage Protection Rating (VPR) – The maximum ANSI/UL 1449 3rd Edition VPR for the device shall not exceed the following:

Modes	208Y/120	480Y/277	600Y/347
L-N; L-G; N-G	700	1200	1500
L-L	1200	2000	3000

C. SPD Design

1. Maintenance Free Design – The SPD shall be maintenance free and shall not require any user intervention throughout its life. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.
2. Balanced Suppression Platform – The surge current shall be equally distributed to all MOV components to ensure equal stressing and maximum performance. The surge suppression platform must provide equal impedance paths to each matched MOV. Designs incorporating replaceable SPD modules shall not be accepted.
3. Electrical Noise Filter – Each unit shall include a high-performance EMI/RFI noise rejection filter. Noise attenuation for electric line noise shall be up to 50 dB from 10 kHz to 100 MHz using the MIL-STD-220A insertion loss test method. Products unable able to meet this specification shall not be accepted.
4. Internal Connections – No plug-in component modules or printed circuit boards shall be used as surge current conductors. All internal components shall be soldered, hardwired with connections utilizing low impedance conductors.
5. Monitoring Diagnostics – Each SPD shall provide the following integral monitoring options:
   a. Protection Status Indicators - Each unit shall have a green / red solid-state indicator light that reports the status of the protection on each phase.

      i. For wye configured units, the indicator lights must report the status of all protection elements and circuitry in the L-N and L-G modes. Wye configured units shall also contain an additional green / red solid-state indicator light that reports the status of the protection elements and circuitry in the N-G mode. SPDs that indicate only the status of the L-N and L-G modes shall not be accepted.

      ii. For delta configured units, the indicator lights must report the status of all protection elements and circuitry in the L-G and L-L modes.

      iii. The absence of a green light and the presence of a red light shall indicate that damage has occurred on the respective phase or mode. All protection status indicators must indicate the actual status of the protection on each phase or mode. If power is removed from any one phase, the indicator lights must continue to indicate the status of the protection on all other phases and protection modes. Diagnostics packages that simply indicate whether power is present on a particular phase shall not be accepted.

   b. Remote Status Monitor – The SPD must include Form C dry contacts (one NO and one NC) for remote annunciation of its status. Both the NO and NC contacts shall change state under any fault condition.

c. Audible Alarm and Silence Button – The SPD shall contain an audible alarm that will be activated under any fault condition. There shall also be an audible alarm silence button used to silence the audible alarm after it has been activated.

d. ∃Surge Counter – The SPD shall be equipped with an LCD display that indicates to the user how many surges have occurred at the location. The surge counter shall trigger each time a surge event with a peak current magnitude of a minimum of 50 ± 20A occurs. A reset pushbutton shall also be standard, allowing the surge counter to be zeroed. The reset button shall contain a mechanism to prevent accidental resetting of the counter via a single, short-duration button press. In order to prevent accidental resetting, the surge counter reset button shall be depressed for a minimum of 2 seconds in order to clear the surge count total.

i. The ongoing surge count shall be stored in non-volatile memory. If power to the SPD is completely interrupted, the ongoing count indicated on the surge counter's display prior to the interruption shall be stored in non-volatile memory and displayed after power is restored. The surge counter's memory shall not require a backup battery in order to achieve this functionality.

6. Overcurrent Protection

a. The unit shall contain thermally protected MOVs. These thermally protected MOVs shall have a thermal protection element packaged together with the MOV in order to achieve overcurrent protection of the MOV. The thermal protection element shall disconnect the MOV(s) from the system in a fail-safe manner should a condition occur that would cause them to enter a thermal runaway condition.

7. Fully Integrated Component Design – All of the SPD's components and diagnostics shall be contained within one discrete assembly. SPDs or individual SPD modules that must be ganged together in order to achieve higher surge current ratings or other functionality shall not be accepted.

8. Safety Requirements

a. The SPD shall minimize potential arc flash hazards by containing no user serviceable / replaceable parts and shall be maintenance free. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.

b. SPDs designed to interface with the electrical assembly via conductors shall require no user contact with the inside of the unit. Such units shall have any required conductors be factory installed.

c. Sidemount SPDs shall be factory sealed in order to prevent access to the inside of the unit. Sidemount SPDs shall have factory installed phase, neutral, ground and remote status contact conductors factory installed and shall have a pigtail of conductors protruding outside of the enclosure for field installation.

2.3 SYSTEM APPLICATION

A. The SPD applications covered under this section include distribution and branch panel locations, busway, motor control centers (MCC), switchgear, and switchboard assemblies. All

SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments.

B. Surge Current Capacity – The minimum surge current capacity the device is capable of withstanding shall be as shown in the following table:

Minimum surge current capacity based on ANSI / IEEE C62.41 location category			
Category	Application	Per Phase	Per Mode
C	Service Entrance Locations (Switchboards, Switchgear, MCC, Main Entrance)	250 kA	125 kA
B	High Exposure Roof Top Locations (Distribution Panelboards)	160 kA	80 kA
A	Branch Locations (Panelboards, MCCs, Busway)	120 kA	60 kA

C. SPD Type – all SPDs installed on the line side of the service entrance disconnect shall be Type 1 SPDs. All SPDs installed on the load side of the service entrance disconnect shall be Type 1 or Type 2 SPDs.

2.4 LIGHTING AND DISTRIBUTION PANELBOARD REQUIREMENTS

A. The SPD application covered under this section includes lighting and distribution panelboards. The SPD units shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category B environments.

1. The SPD shall not limit the use of through-feed lugs, sub-feed lugs, and sub-feed breaker options.
2. SPDs shall be installed immediately following the load side of the main breaker. SPDs installed in main lug only panelboards shall be installed immediately following the incoming main lugs.
3. The panelboard shall be capable of re-energizing upon removal of the SPD.
4. The SPD shall be interfaced to the panelboard via a direct bus bar connection. Alternately, an SPD connected to a 30A circuit breaker for disconnecting purposes may be installed using short lengths of conductors as long as the conductors originate integrally to the SPD. The SPD shall be located directly adjacent to the 30A circuit breaker.
5. The SPD shall be included and mounted within the panelboard by the manufacturer of the panelboard.
6. The SPD shall be of the same manufacturer as the panelboard.
7. The complete panelboard including the SPD shall be UL67 listed.

B. Sidemount Mounting Applications Installation (SPD mounted external to electrical assembly)
1. Lead length between the breaker and suppressor shall be kept as short as possible to ensure optimum performance. Any excess conductor length shall be trimmed in order to minimize let-through voltage. The installer shall comply with the manufacturer's recommended installation and wiring practices.

C. Switchgear, Switchboard, MCC and Busway Requirements

1. The SPD application covered under this section is for switchgear, switchboard, MCC, and busway locations. Service entrance located SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C environments.

2. The SPD shall be of the same manufacturer as the switchgear, switchboard, MCC, and busway
3. The SPD shall be factory installed inside the switchgear, switchboard, MCC, and/or bus plug at the assembly point by the original equipment manufacturer
4. Locate the SPD on the load side of the main disconnect device, as close as possible to the phase conductors and the ground/neutral bar.
5. The SPD shall be connected through a disconnect (30A circuit breaker). The disconnect shall be located in immediate proximity to the SPD. Connection shall be made via bus, conductors, or other connections originating in the SPD and shall be kept as short as possible.
6. The SPD shall be integral to switchgear, switchboard, MCC, and/or bus plug as a factory standardized design.
7. All monitoring and diagnostic features shall be visible from the front of the equipment.

2.5 ENCLOSURES

A. All enclosed equipment shall have NEMA 1 general purpose enclosures, unless otherwise noted. Provide enclosures suitable for locations as indicated on the drawings and as described below:

1. NEMA 1 – Constructed of a polymer (units integrated within electrical assemblies) or steel (sidemount units only), intended for indoor use to provide a degree of protection to personal access to hazardous parts and provide a degree of protection against the ingress of solid foreign objects (falling dirt).
2. NEMA 4 – Constructed of steel intended for either indoor or outdoor use to provide a degree of protection against access to hazardous parts; to provide a degree of protection of the equipment inside the enclosure against ingress of solid foreign objects (dirt and windblown dust); to provide a degree of protection with respect to the harmful effects on the equipment due to the ingress of water (rain, sleet, snow, splashing water, and hose directed water); and that will be undamaged by the external formation of ice on the enclosure. (sidemount units only)
3. NEMA 4X – Constructed of stainless steel providing the same level of protection as the NEMA 4 enclosure with the addition of corrosion protection. (sidemount units only)

PART 3 – EXECUTION

3.1 EXAMINATION

3.2 FACTORY TESTING

A. Standard factory tests shall be performed on the equipment under this section. All tests shall be in accordance with the latest version of NEMA and UL standards.

3.3 INSTALLATION

A. The Contractor shall install all equipment per the manufacturer's recommendations and the contract drawings.

3.4 WARRANTY

A. The manufacturer shall provide a full ten (10) year warranty from the date of shipment against any SPD part failure when installed in compliance with manufacturer's written instructions and any applicable national or local code.

END OF SECTION

SECTION 26 51 00 - LIGHTING

PART 1 – GENERAL

1.1 Provide all lighting fixtures (luminaires), lamps, end caps, connectors, fittings, structural support members, supports, brackets, etc., for a complete and operable lighting system.

PART 2 – SUBMITTALS

2.1 SHOP DRAWINGS

A. Indicate dimensions and components for each luminaire that is not a standard product of the manufacturer.

B. Provide photometric calculations where luminaires are proposed for substitution.

C. Product Data: Provide manufacturer's standard catalog pages and data sheets including detailed information on construction, dimensions, ratings, finishes, mounting requirements, listings, service conditions, and installed accessories; include model number nomenclature clearly marked with all proposed features.

2.2 Certificates for Dimming Ballasts: Manufacturer's documentation of compatibility with dimming controls to be installed.

2.3 Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

2.4 Operation and Maintenance Data: Instructions for each product including information on replacement parts.

2.5 Project Record Documents: Record actual connections and locations of luminaires and any associated remote components.

PART 3 – PRODUCTS

3.1 DELIVERY, STORAGE, AND PROTECTION

A. Receive, handle, and store products according to NECA/IESNA 500 and manufacturer's written instructions.

B. Keep products in original manufacturer's packaging and protect from damage until ready for installation.

3.2 LUMINAIRES

A. Luminaires are shown in the Luminaire Schedule on the drawings to establish a standard of quality. Manufacturer’s names and model numbers shall not be interpreted as a proprietary specification. Notify the engineer at least two weeks prior to bid if an equivalent for a fixture listed in the schedule is not readily available.

B. Prior to submitting electrical equipment brochures for review and approval, coordinate with the General Contractor and verify that the fixtures are appropriate for the ceiling types in which they

are shown to be installed. Also verify that the voltage on the submittals is appropriate for the electrical system on which the fixtures are to be installed (regardless of voltage listed in the part number in the Fixture Schedule). Submit with equipment brochures a certificate stating that these items of coordination have been completed.

C. Coordinate the work to provide ballasts/drivers compatible with the lighting controls to be installed.

D. Color samples for all fixture finishes shall be submitted to the Architect for approval prior to ordering fixtures.

E. Emergency Power Supply Units: Suitable for use with indicated luminaires, complying with NFPA 101, all applicable state and local codes, and listed and labeled as complying with UL 924.

3.3 LAMPS

A. T8 fluorescent lamps shall be rapid-start with a Color Rendering Index (CRI) of 75 and a color temperature of 3500K.

B. T5 & T5HO fluorescent lamps shall be rapid-start with a Color Rendering Index (CRI) of 82 and a color temperature of 3500K.

C. HID Lamps shall be clear unless otherwise noted. They shall have a color temperature of 3500K. Coordinate base size with fixture socket prior to ordering lamps.

D. LED lamps shall be LM79 and LM80 tested.

3.4 LED DRIVERS

A. General Requirements:

1. Operate for at least 50,000 hours at maximum case temperature and 90 percent non-condensing relative humidity.

2. Provide thermal fold-back protection by automatically reducing power output (dimming) to protect LED driver and LED light engine/fixture from damage due to over-temperature conditions that approach or exceed the LED driver's maximum operating temperature at calibration point.

3. UL 8750 recognized or listed as applicable.

4. Class A sound rating; Inaudible in a 27 dBA ambient.

5. Demonstrate no visible change in light output with a variation of plus or minus 10 percent change in line-voltage input.

6. LED drivers of the same family/series to track evenly across multiple fixtures at all light levels.

7. Offer programmable output currents in 10 mA increments within designed driver operating ranges for custom fixture length and lumen output configurations, while meeting a low-end dimming range of 100 to 1 percent or 100 to 5 percent as applicable.

8. Employ integral fault protection up to 277 V to prevent LED driver damage or failure in the event of incorrect application of line-voltage to communication link inputs.

9. LED driver may be remote located up to 100 feet (30 m) from LED light engine depending on power outputs required and wire gauge utilized by installer.

B. Driver Control:

1. Provide integral fault protection to prevent driver failure in the event of a mis-wire.

2. Operate from input voltage of 120 V through 277 V at 50/60 Hz.

3. Drivers and their associated controls shall be coordinated to ensure they are compatible.

3.5 BALLASTS

A. Fluorescent luminaires shall be furnished with energy-saving, high power factor (0.9 or greater), electronic ballasts. Ballasts shall operate lamps without noticeable flicker and shall operate within the IES recommended noise levels. Ballasts shall operate at a frequency no less than 20,000 Hz. Total harmonic distortion shall be less than 10%. Ballasts shall be able to withstand voltage transients in accordance with IEEE C62.41, Category A for normal and common modes. Ballasts shall be compatible with the lamps furnished. Furnish number and size of ballasts as required to operate the number of lamps indicated with the control schemes shown.

B. Fluorescent ballasts for light fixtures controlled by occupancy sensors shall be programmed start ballasts with the lamps wired in parallel. Failure of one lamp shall leave the rest of the lamps illuminated.

C. Emergency Battery Packs: Emergency Battery Packs in fixtures shall consist of an automatic power failure device and a test switch. They shall contain a fully automatic solid state charger in a self-contained power pack. Wiring Diagrams shall be furnished with the fixture showing switching connections. The battery shall be of the sealed electrolyte type with the capacity to provide power to the lamps provided for a minimum of 90 minutes at an 1100 lumens.

The battery shall be able to operate unattended with no maintenance for a period of no less than five years. Emergency ballasts shall be fully compatible with solid state ballasts. Battery packs shall be mounted inside the fixture unless remotely mounted ballasts are shown on the drawings, or unless the fixture is of a type that does not have room for internally mounted battery packs.

D. Where quartz restrike fixtures are fed at voltages different than 120V, they shall be furnished with integral transformers and all equipment necessary to feed the quartz fixtures at 120V.

3.6 SUPPORTS

A. Provide all structural members necessary to support fixtures in locations shown on the contract drawings. Submit mounting and support details to the Architect or Engineer for approval with the project shop drawings. Notify the General Contractor prior to bid of any structural work that will be required to support the fixtures.

B. Provide hangers, cords, stems, etc., where required. Coordinate with the Architect or Engineer for proper stem lengths prior to ordering fixtures.

C. Support the ceiling grid at all four corners of recessed light fixtures.

D. Provide clips for fixtures installed in lay-in ceilings. Clips shall be equal to Erico Caddy clips # 515 or #515A.

PART 4 – EXECUTION

4.1 Raceways for lighting systems in accessible ceilings shall be run to junction boxes mounted in locations that do not interfere with the ceiling installation, the luminaire installation, or other building systems. Provide final connections to fixtures using conductors in flexible conduit. Flexible conduit whips shall not exceed six feet in length.

4.2 Coordinate locations of outlet boxes provided under Section 26 0533 as required for installation of luminaires provided under this section.

4.3 Perform work in a neat and workmanlike manner in accordance with NECA 1.

4.4 Install luminaires in accordance with NECA/IESNA 500 (commercial lighting).

4.5 Install luminaires plumb and square and aligned with building lines and with adjacent luminaires. All recessed fixtures shall be mounted with their trims flush against the ceiling.

4.6 Remote Ballasts/Drivers: Install in accessible location as indicated or as required to complete installation, using conductors per manufacturer's recommendations not exceeding manufacturer's recommended maximum conductor length to luminaire.

4.7 Comply completely with all manufacturers' installation instructions.

4.8 Fixture lengths shall be measured and submitted to the manufacturer in accordance with the manufacturer's installation requirements. Fixtures shall be of exact lengths required for the application as determined during construction. Fixtures shall be installed to the Owner, Architect, and Engineer's satisfaction.

4.9 Inspect each product for damage and defects.

4.10 Operate each luminaire after installation and connection to verify proper operation.

4.11 Test emergency power supply units to verify proper operation upon loss of normal power supply.

4.12 Correct wiring deficiencies and repair or replace damaged or defective products. Repair or replace excessively noisy ballasts as determined by Architect.

4.13 Clean surfaces according to NECA/IESNA 500 and manufacturer's instructions to remove dirt, fingerprints, paint, or other foreign material and restore finishes to match original factory finish.

4.14 Fixtures shall be warranted for a period of one year after beneficial occupancy. Incandescent lamps shall be warranted for 90 days after beneficial occupancy. Fluorescent and HID lamps shall be warranted for 180 days after beneficial occupancy. LED lamps shall be warranted for a period of two years after beneficial occupancy.

END OF SECTION

SECTION 26 51 01 - MOTION DETECTORS

PART 1 GENERAL

1.1 Furnish and install a complete system of Motion Detectors as shown on the drawings and as specified herein. The drawings are provided to show the general scope of the work, and show the absolute minimum components required. Actual system components, quantities, and locations shall be determined by the motion detector vendor and provided to the Contractor with the installation shop drawings.

1.2 The Contractor and Sales Representatives are advised to take notice of specified component characteristics when attempting to select and propose substitutions. It is highly unlikely that substitutions on a one-for-one component basis will produce results that provide acceptable system performance.

1.3 Provide all power packs, hardware, software, devices, circuitry, and other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer.

1.4 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable. Shop drawings shall be provided whether the contractor provides specified components or materials of other manufacturers.

PART 2 PRODUCTS

2.1 Motion detectors shall be furnished with the manufacture and model number shown on the drawings or an approved equal.

2.2 Power Packs: Power packs shall be of the same manufacturer as the motion detectors. Each shall be capable of controlling a 20 ampere circuit. They shall be rated for operation at the voltage of the system on which they will be used.

2.3 Circuitry: Provide control circuitry as required by the manufacturer for optimum system operation, but no less than the following: Control cables shall be 3-conductor #22 AWG copper with an overall jacket. Adjust conductor sizes as required to overcome unacceptable voltage drop.

PART 3 EXECUTION

3.1 Motion detectors shall be provided so that their coverage areas overlap and there are no dead zones in the rooms where persons may stand and not be detected.

3.2 All work shall be done by qualified system technicians.

3.3 Wiring, including control wiring, shall be in Raceways meeting Specification.

3.4 Guarantee workmanship and material for a period of one year after final acceptance. During the warranty period, repair or replace faulty equipment at no cost to the Owner for labor, material, or expenses.

3.5 Upon completion of job, test entire system. After testing, submit a certificate to the Architect stating

verification of the following:

A. All devices have been tested and are working properly.

PART 4 CLOSE-OUT DOCUMENTS

4.1 Provide the following documents to the Architect for delivery to the Owner at the time of substantial completion:

A. Written Guarantee

B. Two sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, a description of operation, shop drawings, wiring diagrams, maintenance procedures, and other literature required for operation and maintenance of equipment.

4.2 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written step-by-step instructional material.

4.3 Notify the General Contractor that you are to present during the Pre-final Inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels covers as required to show the quality of the installation. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 27 05 13 - CABLE TELEVISION

PART 1 - GENERAL

1.01 SCOPE OF WORK:

A. Provide a complete and operable Cable Television System including, but not limited to, cabling, conduits, raceways, boxes, outlets, jacks, splitters, preamplifiers, amplifiers, and attenuators.

B. Comply completely with all Cable Company requirements. Include all costs associated with this compliance in bid. Notify Architect at least ten days prior to bid if Cable Company requirements differ from those described in the construction documents.

PART 2 - PRODUCTS

1. Cable for Distribution from Terminal Blocks to Outlet Jacks: Television cable shall be plenum-rated double-shielded RG6/U, #18 AWG bare copper with an aluminum polyester aluminum tape with 100% coverage and an aluminum braid with 45% coverage.

2. Jacks: Outlet boxes shall be flush mounted. Each shall be equipped with a cover plate containing a type F female connector.

3. Conduit shall be sized per the NEC for the number of cables provided, but no less than ¾" nominal trade size.

4. Conduit shall comply with the RACEWAYS specification.

5. Terminal Board: Provide a ¾" x 48" x 48" sheet of plywood, primed, and coated with two coats of enamel paint (consult architect for color and finish texture). Verify terminal board requirements with local cable company.

6. Terminal Blocks: Provide terminal blocks for termination of the Local Cable Television Cables at the New Terminal Board having the number of outlets required to serve the outlets provided in this contract plus 10% spare. Provide terminators as required on the spare outlets.

7. Amplifiers, Preamplifiers, and Attenuators: Provide amplifiers, preamplifiers, and attenuators as required for optimum system operation.

PART 3 - EXECUTION

3.01 CONDUIT ROUTING:

A. Interior conduits for the Cable Television System shall extend from the wall outlets and terminate with a bushing above the cable tray.

B. Provide a 4" PVC conduit from the Main Telephone Data Backboard to the right-of-way for the Cable Television Service. Use only long radius bends. Provide the conduit with a pull string. Coordinate with the cable company to have cable service provided to the building. Pay all costs associated with having the cable service connected.

3.02 CABLING:

Homerun one cable from each Type F jack in each outlet box to the nearest telephone data backboard.

Terminate one cable on the terminal block, or amplifier, for Local Cable Television Service.

3.03 WORKMANSHIP & TESTING:

A. Provide a television set and test each outlet for a clear signal and proper operation. Demonstrate operation of the television set at each jack in the presence of the Architect. Provide a typewritten log listing each outlet jack and obtain the Architect's signature as evidence that you have demonstrated proper operation of the system.

B. All work shall be performed by competent technicians trained and experienced for at least two years in the installation of telephone equipment.

C. The Architect and/or Owner may reject work that performs unsatisfactorily or that is not installed to be aesthetically pleasing.

END OF SECTION

SECTION 27 30 00 - TELEPHONE AND DATA SYSTEMS

PART 1 – GENERAL

1.1 Provide complete telephone and data systems in accordance with this specification and the contract drawings. All systems shall be furnished and installed to meet or exceed EIA/TIA Category 6 Standards.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 All new wiring on this project shall conform to the EIA TIA 568A T568A or T568B scheme. **Verify with Owner's representative at the coordination meeting which termination configuration to use.**

1.4 Prior to ordering equipment, provide six sets of manufacturer's cut sheets to the Architect or Engineer for the equipment to be installed. Also submit shop drawings showing the floor plan with all wiring tag identification and conduit and cable routing. Do not order any equipment without receiving submittals and shop drawings that have been reviewed and approved by the Engineer.

1.5 Contractors furnishing and installing telephone and data system components shall be regularly involved in furnishing and installing systems of the type specified. They shall have installed five systems similar in size and scope within the past six months. The Telephone and Data System Contractor shall pull the cable as well as install all jacks and make all other system terminations.

PART 2 – PRODUCTS

2.1 Outlet Boxes: Provide outlet boxes in accordance with Specification 26 05 33.

2.2 Plaster Rings: Plaster rings shall be furnished to provide single-gang openings in outlet boxes unless otherwise noted.

2.3 Raceways: Provide raceways in accordance with Specification 26 05 33.

2.4 Jacks: Provide outlet boxes with a strap containing the number of Jacks indicated on the drawings. Outlet jacks shall be 8-position, 8-conductor, RJ-45 jacks that are multivendor supportive accepting most phone and data plugs. Jacks shall have gold-plated (50 microinches minimum) contacts with 110 connections on the back. The jacks shall snap in the straps. The straps shall be colored to match the switches and receptacle color selected by the Architect. The straps shall be covered by a stainless steel wallplate identical to those of the receptacles and switches. Telephone outlet jacks shall be yellow; data jacks shall be blue.

2.5 Cable: All cable shall be Category 6 rated and shall conform to or exceed the EIA/TIA 578 Commercial Building Wiring Standard, Horizontal Cable Section and the EIA/TIA Technical Systems Bulletin 36 for Unshielded Twisted Pair Cables. Other standards supported shall include IEEE 802.3, Ibase5, 10BASE-T; IEEE 802.5, 4 Mbps, 16 Mbps (328 ft/100m), 104 Workstations, proposed ANSI X3T9.5 TP-PMD requirements for UTP at 100 Mbps, and 155 MB ATM. Cabling

shall be UL listed. Telephone cables shall be yellow; data cables shall be blue. All Cable shall be plenum rated.

2.6 Telephone and Data Backboard (TDBB): Wall mount a ¾" x 4' x 4' sheet of fire retardant plywood, primed and painted with two coats of fire retardant paint of the color and finish selected by the Architect. Do not paint over the fire retardant stamp. Provide a ¼" x 4" x 17.75" copper ground block (Erico Eritech TMGB-A18L23PT or approved equal) on the wall, bond a #2 AWG copper conductor to the ground block with a two hole compression lug and run the #2 AWG ground wire to the electrical power system ground. Bond the #2 AWG ground wire to the power system electrode using an exothermic weld.

2.7 Punchdown Blocks: Telephone cables shall terminate at the Telephone & Data Backboard on Punchdown Blocks. Telephone Cabling shall be terminated on 110 punchdown blocks maintaining the Category 6 rating. Furnish punchdown blocks for all telephone outlets in this contract plus 25% additional outlets.

2.8 Patch Panels: Data Cables shall terminate at the Telephone & Data Backboard in patch panels. Provide a patch panel (or panels) at each TDBB to accommodate all cabling plus 15% spare capacity. Provide crossconnecting cables as required to interconnect the patch panels providing the Owner a single connection point for a connection to a server.

2.9 Racks: Provide a freestanding, minimum 78" tall, 19" rack for mounting of the patch panels. The rack shall be mounted on the floor in front of the TDBB.

PART 3 – EXECUTION

3.1 Provide a 1" conduit extending from each outlet box to a point above equipment rack. Terminate the conduit with a protective bushing.

3.2 Route conductors from the outlet box to the patch panels through the conduits.

3.3 Provide a minimum of two data cables to each data outlet or combination telephone/data outlet. Provide one cable to each telephone outlet.

3.4 Mount plywood backboard securely to wall framing members. The bottom of the backboard shall be 6" above the finished floor.

3.5 Provide a #2 copper ground wire in 1" PVC conduit from the Telephone and Data Backboard to the Building Power System Ground.

3.6 Service Conduits: Provide two 4" PVC conduits with long radius elbows from the Telephone and Data Backboard to a point 5' outside of the building. These conduits shall be for future use by the Owner. Conduits bends shall contain radii that are no less than 10 times the conduit diameter. Furnish conduits with pullstrings. Stub conduits up 4" above the floor at the Telephone and Data Backboard and cover with plastic caps. Do not glue the caps on the conduits. Seal conduits below grade to prohibit the entrance, of dirt, water, and gases. Service conduits shall be buried 24" to 36" below grade. Mark the end of the conduits by placing a vertical stick of conduit from the end of the conduit vertically to a point at least 12" above grade. Provide physical protection as well as warning tape attached to stakes around the marker.

Equip all spare conduits with a pullwire or string capable of withstanding 500 pounds of pulling tension.

3.7 Uniquely identify and label all cables at each end using EIA/TIA Standards. Provide engraved or professionally stenciled label markings on the faceplate beside each jack.

3.8 Test each cable for opens, shorts, correct pairs, crossed wiring, and proper termination using a CT200 tester from Atcom Services, Inc. or approved equal. Replace any cable that is unable to pass the tests. Provide a written log of the test results of each cable to the Engineer at the prefinal inspection. Demonstrate testing of any cables selected by the Engineer.

END OF SECTION

SECTION 27 51 13 - PAGING SYSTEM

PART 1 – GENERAL

1.1 Provide a complete and operable Paging System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide. This specification requires the furnishing vendor to appropriately size the amplifier for the speakers to be provided.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 The Paging System shall consist of all components necessary to provide paging through the Owner's telephone system. Minimum system components shall include speakers, circuitry, an amplifier, and a telephone interface module. Provide all additional equipment, material, circuitry, labor, etc. for a complete and operable Paging System.

1.4 Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the intercom equipment prior to bid. The Electrical Contractor shall include all costs for powering the intercom equipment in the bid.

1.5 The specification provided is intended to establish a standard of quality – not to limit competition. Equivalent systems of other manufacturers will be acceptable. Gain approval of other manufacturers at least 10 days prior to bid. Acceptance of the manufacturer does not ensure that the actual components submitted after bid will be considered equivalent.

1.6 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

1.02 SUBMITTALS:

Submit six sets of the following documents to the Architect for the Engineer's review and approval prior to ordering any equipment:

A. Technical specification sheets on each equipment item.
B. Complete wiring diagram indicating wire and cable numbers, terminal strip designations, and equipment model numbers.
C. Equipment mounting elevations.
D. Single line diagram.
E. Floor plans showing all equipment locations and conduit routing.
F. Amplifier Sizing Calculations

1.03 QUALIFICATIONS:

A. The Contractor furnishing and installing the system shall be a licensed distributor for the

system being installed. The Contractor shall regularly provide systems of the size, scope, and quality specified.

B. The Contractor shall have completed five projects in the last 2 years of the same complexity and dollar value.

C. The Contractor shall employ qualified electronic technicians, trained in the installation, setup, and repair of systems of the type specified.

PART 2 - PRODUCTS

2.01 All equipment shall be new, U.L. listed equipment.

2.02 Ceiling-Mounted Speakers shall be 8 inch, 6 oz., flush ceiling mount speakers with 70V impedance-matching transformers and integral volume control. Speakers shall be Bogen S86T725-BRV-CG8AW or approved equal. Furnish speakers complete with backboxes, T-grid ceiling supports where required, and aluminum baffle finished with semi-gloss white enamel. Provide appropriate mounting hardware for ceiling into which the individual speakers will be installed.

2.03 Horn Type Speakers shall be weatherproof, 15 watt horn type speakers with a 70V transformer. Horn Type Speakers shall be Bogen SPT-15A or approved equal.

2.04 Amplifier: Bogen TPU15A, TPU35B, TPU60B, TPU100B, TPU250, or approved equal. Size the amplifier for system speakers provided assuming that all are set at their highest tap. Provide attenuators as required to protect speakers from excess power.

2.05 Provide an appropriate telephone interface module at the telephone and data backboard to allow all-call pages to be made via the Owner’s telephone system.

2.06 Mounting Bracket: Mount the amplifier on the telephone and data backboard with a metallic mounting bracket manufactured for the purpose.

2.07 Terminal Blocks: All conductors in cabinets, on equipment racks, etc. shall be terminated on Siemens 66M1-50 punch blocks or approved equal.

2.08 Speaker Cabling: All speaker cabling shall be stranded, twisted, shielded pairs with PVC jacket and a tinned copper drain wire. The shield shall be an aluminum polyester foil providing 100% coverage. The conductors shall be sized as required for system to function appropriately, but shall not be less than #22 AWG.

2.09 Conduit shall be provided per Specification Section 16110, sized per the NEC, but no less than 3/4" nominal trade size.

PART 3 - EXECUTION

3.01 All wiring shall be installed in conduit. Conduit shall be run concealed in office areas.

3.02 Install all components per the manufacturer's specifications and instructions.

3.03 Furnish terminal strips, punch blocks, and connectors for all interconnections.

3.04 Identify all normally operated controls and electronic devices with an engraved plastic nameplate.

3.05 Installation Testing: Set taps and adjust speakers for Architect’s approval. Demonstrate all features of system. Submit a signed Certificate at the end of system testing certifying that all

equipment has been installed in accordance with the manufacturer's requirements and the system is operating properly.

3.06 Guarantee workmanship and/or material executed under this division for one (1) year after final acceptance. During the warranty period, the Owner shall receive repairs and replacement of faulty equipment at no cost for labor, material, or expenses. A repair technician shall respond to Owner calls by arriving at the school within twenty-four hours of any repair request.

3.07 Coordinate work with other trades. Notify the electrical power system contractor of all power requirements for your equipment prior to bid. Include all labor, installation, and equipment costs for additional power system components not shown on the contract drawings, but required by your equipment in your bid. Notify the Engineer of any conflicts at least ten days prior to bid.

3.08 Install work in accordance with the General Contractor's schedule.

Part 4 – CLOSE-OUT DOCUMENTS

4.01 Provide the following documents to the Architect for delivery to the Owner at time of substantial completion:

A. Written guarantee.

B. Two (2) sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, description of operation, shop drawings, wiring diagrams, maintenance procedures and other literature required for maintenance of equipment. The data shall reflect as-built conditions.

4.02 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written instructional material.

4.03 Notify the General Contractor that you are to be present during the system pre-final inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels as required to show the quality of the installation. The system shall demonstrate proper operation and operate without any audible hum, distortion, or erroneous noises. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 27 51 23 - INTERCOM SYSTEM

PART 1 - GENERAL

1.1 Provide a complete and operable Intercom System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 The specification provided is intended to establish a standard of quality – not to limit competition. Equivalent systems of other manufacturers will be acceptable. Gain approval of other manufacturers at least 10 days prior to bid. Acceptance of the manufacturer does not ensure that the actual components submitted after bid will be considered equivalent.

1.4 Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the intercom equipment prior to bid. The Electrical Contractor shall include all costs for powering the intercom equipment in the bid.

1.5 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

PART 2 – PRODUCTS

2.1 Intercom Master Stations: The Intercom System shall be of the open voice selective call type. It shall mount semi-flush and be equipped with door answering, room monitoring, and privacy capabilities. The unit shall be able to place a call to every station in the system. Master Stations shall be able to place calls to Sub-stations and receive calls from the Sub-Stations. Master Units shall sound an audible tone and be equipped with an LED that illuminates upon being called from a Sub-Station or Master. Master Stations shall be Aiphone LEF-10 or approved equal.

2.2 Intercom Sub-Stations: Intercom-Sub Stations shall be surface mounted and weatherproof. They shall be compatible with the Master Stations. Sub-stations shall be equipped with a button that requests communication with the master station. They shall be Aiphone LE-D or approved equal.

2.3 Intercom Power Supply: The power supply shall be capable of supporting Two Master stations and up to three door stations. The unit shall be an Aiphone PC-12C or approved equal.

2.4 Cable: All cables shall be plenum-rated. Verify the following cabling requirements with the vendor prior to bid.:

(1) Cable for the Intercom Power Supply shall be 3-conductor 22 gauge.

(2) Cable for Master Station to Master Station shall be 10-conductor 20 gauge.
(3) Cable from the first Master Station to the Power Supply shall be 3-conductor, 20 gauge.

PART 3 - EXECUTION

3.1 All Intercom System cabling shall be installed in raceways meeting the requirements of Specification 16110 RACEWAYS.

3.2 Each cable passing from outside to inside the building shall be equipped with surge protectors at each end meeting the requirements of the TRANSIENT VOLTAGE SURGE SUPPRESSORS (TVSSs) FOR COMMUNICATIONS AND AUXILIARY SYSTEMS Specification.

3.3 Provide fuses sized per manufacturers' instructions for all system components.

3.4 Test the entire system to ensure that it is completely operable prior to the pre-final inspection. Notify the General Contractor that you are to be present at the pre-final inspection.

3.5 Provide two hours of instruction to the Owner on operation and use of the system.

3.6 Provide a one-year warranty for the system and all components. The warranty shall begin at the date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

SECTION 28 20 00 - INTRUSION DETECTION SYSTEM

PART 1 - GENERAL

1.1 Furnish and install a complete and operable Security System as shown on the drawings and as specified herein.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 Provide all enclosure, hardware, software, devices, circuitry, and other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect and Engineer.

1.4 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

PART 2 - PRODUCTS

2.1 Security System Controller: The Security System Controller shall support up to 9 hardwired zones with a total of 64 zones. It shall support addressable motion detectors and door switches. The controller shall support up to 8 relays or X-10 devices. It shall be connected to the building telephone system and send coded signals to the monitoring agency of the Owner's preference. Pay the monitoring fee from the testing of the system until the General Contractor is granted the Letter of Substantial Completion. The Security System Controller shall be an ADEMCO VISTA-40 or approved equal.

2.2 Keypads: Keypads shall have a backlit display that displays system events. They shall make audible "beeps" for entry/exit delays, system status and other alarm conditions. Keypads shall be ADEMCO 6139 or approved equal.

2.3 Motion Detectors: Motion Detectors shall have a 50' x 50', 90 degree coverage and shall detect using passive infrared technology. They shall have both dip switch and serial number addressing. They shall have both horizontal and vertical patterning adjustment. Motion Detectors shall be ADEMCO 998MX or approved equal.

2.4 Glass Break Detectors: Glass Break Detectors shall detect using a dual technology audio and shock glass break detector with a 25' range from the glass. Glass Break Detectors shall be ADEMCO 2500 or equal.

2.5 Door Switches: Door Switches shall be addressable, magnetic contact, recessed type. Door Switches shall be ADEMCO 4191SN or equal.

2.6 Sirens: Sirens mounted indoors shall have an output of 95 Db at 10'. They shall be ADEMCO 747 or approved equal. Sirens mounted in damp locations, such as on the Ground Floor, shall produce 117 dB at 10'. They shall be ADEMCO 702 or approved equal.

2.7 Circuitry: Provide circuitry and cabling as required for optimum system operation, but meeting no less than the following specifications:

(1) Cable for Keypads, Motion Detectors, and Glass Break Detectors shall be 4-conductor, 22 gauge with PVC jacket.
(2) Cable for Door Switches shall be 2-conductor, 20 gauge with PVC jacket.

PART 3 - EXECUTION

3.1 All work shall be done by qualified system technicians.

3.2 Wiring shall be in Raceways meeting Specification 16110.

3.3 Connect to telephone system for complete dialing capability. Employ Owner's designated monitoring agency to monitor system. Consult Owner prior to configuring system.

3.4 Guarantee workmanship and material for a period of one year after final acceptance. During the warranty period, repair or replace faulty equipment at no cost to the Owner for labor, material, or expenses.

3.5 Upon completion of job, test entire system. After testing submit a certificate to Architect stating verification of the following:

PART 4 – CLOSE-OUT DOCUMENTS

4.1 Provide the following documents to the Architect for delivery to the Owner at the time of substantial completion:

A. Written Guarantee
B. Two sets of data prepared by the manufacturer for each item of electrical equipment completely describing each piece of equipment. The data shall include parts lists, a description of operation, shop drawings, wiring diagrams, maintenance procedures, and other literature required for operation and maintenance of equipment.

4.2 Instruct the Owner on system operational procedures. Notify the Owner and Architect at least one week in advance of the training session. Provide written step-by-step instructional material.

4.3 Notify the General Contractor that you are to present during the Pre-final Inspection. During that inspection, demonstrate all system functionality and capabilities; remove cover plates and panels covers as required to show the quality of the installation. The Owner, Architect, and Engineer reserve the right to reject unsuitable workmanship or performance.

END OF SECTION

SECTION 28 23 23 - CLOSED CIRCUIT TELEVISION (CCTV) SYSTEM

PART 1 – GENERAL

A. Provide a complete and operable IP Based Closed Circuit Television System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide.

B. Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

C. Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Architect, Owner, and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the CCTV equipment prior to bid. The Electrical Contractor shall include all costs for powering the CCTV equipment in the bid.

D. Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

E. Prior to submitting equipment brochures for approval, the successful Electronic Systems Contractor shall completely review the design to ensure that the lens selection is optimum for each application, that all mounting brackets are appropriate for the wall or ceiling on which they will be mounted, and that all cabling is adequate to overcome any voltage drop problems or distance limitations that may occur.

F. The POE switches, Network Attached Storage, and all camera-related networking devices shall be completely operational on a standalone network that is accessible by the Owner's network. Provide the necessary connections to interface the camera network to the Owner-supplied equipment.

G. All components required for the following basic system operation shall be furnished in the quantities required to completely implement the desired mode of operation. Additional components shall be supplied by the Contractor as required to fully implement the system described. All system components shall record and display high definition color images.

    1) A 19 inch monitor connected to the Data Storage System shall be located in the Telephone Equipment Room. It shall be capable of viewing all images.

    2) Fire Admin: Two computer systems shall be furnished, installed, and configured for viewing CCTV images. One computer shall be installed at the Reception Desk in Room 116 and at the desk in Office 204.

    3) Police Admin: Four computer systems shall be furnished, installed, and configured for viewing CCTV images. One computer shall be installed at Security A103. The other three computer systems shall be installed in locations specified by the Owner.

4) There shall be no annual charges for any equipment or software licenses for equipment and software furnished on this project. Remote viewing software shall be entirely free of charge.

PART 2 – PRODUCTS

2.1 Video Management Software

The Video Management Software shall be provided with the system free of charge, with no hidden license or update fees. It shall be a Microsoft Windows based software.

2.2 Cameras

A. Type A Cameras: Type A cameras shall be Mobotix MX-D15Di-Sec-DNight-FIX-D25N25 or approved equal. Provide with corner wall mount MX-MH-Dome where shown wall mounted.

B. Type AW Cameras: Type A cameras shall be Mobotix MX-D15Di-Sec-DNight-FIX-D25N25 or approved equal. Provide with wall mount MX-WH-Dome where shown wall mounted.

C. Type B Cameras: Type B cameras shall be Mobotix MX-Q24M-Sec-D11 or approved equal.

D. Type C Cameras: Type C cameras shall be Mobotix MX-M24M-Sec-N22 or approved equal. Provide with pole mount MX-MH-SecureFlex-ESWS where shown pole mounted.

2.3 POE Switches: The camera POE switches shall be HP ProCurve Switch 2510 Series or approved equal. A POE switch shall be mounted in the Telecommunications Equipment Rack in the Telephone Equipment Room.

2.4 Data Storage System: Provide a complete system of equipment for data storage and viewing for all camera images. All images shall be recorded continuously. Provide the network attached storage (NAS), transmitters, receivers, cabling, software, installation and all other equipment required for a complete and operable system. The NAS shall be a QNAP TS-469U-SP with 6 TB of hard drive storage included or approved equal.

2.5 Equipment Mounting: Mount the equipment in the Telecommunications Equipment Rack furnished under Section 27 30 00. The NAS and switches in the Telephone Equipment Room shall be mounted in the rack.

2.6 Computer Systems: The computer systems shall meet the following specifications:

A. Central Processing Unit (CPU): The personal computer system CPU shall be dual core @ 2.4 GHz (Core Duo Intel processor or equivalent AMD). The system shall have at least 4 gigabytes of RAM and be equipped with at least a 250 gigabyte hard drive. The unit shall be furnished with a CD-RW drive and a DVD-RW drive. The CPU shall be equipped with at least two communications ports along with all other necessary hardware and software to support all components of the system. The system shall have a parallel port, a serial port, no less than three USB ports, and a 10/100/1000 Mbps (Gigabit) Ethernet port. The system shall have a graphics card with 512 megabytes video memory or higher and DVI/HDMI ports compatible with the provided monitor. The CPU, monitor, keyboard, and entire system shall be manufactured by Hewlett Packard, Dell, Toshiba, or Sony.

B. Monitor: The monitor shall be at least a 21” Flat Screen.

C. Keyboard: The keyboard shall be a standard QWERTY keyboard with numeric keypad on the right side.

D. Mouse: The mouse shall be a Microsoft or Logitech three-button mouse. Track balls will not be accepted.

E. Software: The computer shall be furnished with the vendor's latest Windows-based software installed.

2.7 Monitor: The 19" multiplex monitor connected to the DAS shall be Pelco PMCL419HB or approved equal.

2.8 Circuitry: Provide all circuitry necessary for optimum performance of system components. Minimum requirements are provided as follows. Increase conductor sizes and modify cable types as required to compensate for voltage drop or other system or site conditions.

A. Video Signal Cable: All CCTV video cabling shall be Category 6 rated UTP, outdoor-rated cable installed in conduit.

B. Fiber Optic Cabling: Cameras at distances exceeding the limitations of Category 6 cable shall be fed with four strand, single mode fiber optic cable. Media converters shall be provided at the nearest POE switch and at the camera. Coordinate remote camera locations with the Electrical Contractor to ensure that he provides 120V power in those locations.

C. Power Cable: Coordinate remote camera locations with the Electrical Contractor to ensure that he provides 120V power in the locations where fiber optic to POE media converters are provided. Power cable shall be #12 AWG unshielded cable with PVC jacket. It shall be West Penn #227 or approved equal. Increase conductor sizes as required to accommodate voltage drop. The Owner shall not be responsible for additional 120V power as required to accommodate additional media converters.

PART 3 – EXECUTION

3.1 All CCTV cabling shall be installed in raceways meeting the requirements of the RACEWAYS specification.

3.2 Surge Protective Devices shall be installed on all cables where they leave and where they enter any building.

3.3 Test the entire system to ensure that it is completely operable prior to the pre-final inspection. Notify the General Contractor that you are to be present at the pre-final inspection.

3.4 Schedule a training session with the Owner through the General Contractor at the Owner's convenience. The training session shall be scheduled to occur after the Owner's switches have been installed and the Owner's computer network has been made operable. The installation and configuration of remote viewing of CCTV images shall be demonstrated with the completed CCTV system provided in this contract. Begin scheduling this training at least one month prior to substantial completion. Provide four hours of instruction to the Owner on operation and use of the system. Video the training session and provide a DVD of the training session to the Owner with the close-out documents. The training session shall not be conducted until all system components have been tested and verified to be operating properly.

3.5 Provide a one-year warranty for the system and all components and a five-year warranty on all fixed cameras. The warranty shall begin at the date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

SECTION 28 30 00 - ACCESS CONTROL SYSTEM

PART 1 - GENERAL

1.1 Provide a complete and operable Door Locking Control System as shown on the drawings and as specified herein. The drawings and this specification are provided to convey the intent of the complete system and do not indicate every cable or component necessary for the complete system that the Contractor shall provide.

1.2 Prior to the submitting equipment brochures for review, the Electrical Contractor shall coordinate with the General Contractor to call for a coordination meeting with all special systems equipment vendors, the electrical engineer of record, and the Owner's Information Technology and Security Personnel. During this coordination meeting, all aspects of the Telecommunications Cabling System, the CCTV System, the Access Control System, the Intrusion Detection System, the Paging System, and the Intercom System shall be thoroughly reviewed and discussed to ensure that the systems that will be proposed will meet all of the Owner's needs.

1.3 The specification provided is intended to establish a standard of quality – not to limit competition. Equivalent systems of other manufacturers will be acceptable.

1.4 Provide all support hardware including additional steel framing, enclosures, hardware, electronics, cables, terminations, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Owner and Engineer. Notify the Electrical Contractor furnishing the power equipment, circuitry, and devices required for the Door Locking Control System equipment prior to bid. The Electrical Contractor shall include all costs for powering the Door Locking Control System equipment in the bid.

1.5 Submit six sets of manufacturer's cut sheets describing completely all equipment, and six sets of shop drawings showing all circuitry including terminal-to-terminal connections. The shop drawings shall provide a complete schematic of all components used on this project with their interconnecting circuitry. General manufacturer's data sheets are not acceptable.

PART 2 – PRODUCTS

2.1 Card Reader Controller: The controller shall be capable of controlling access to the doors shown on the drawings plus at least four more.

2.2 Personal Computer System: Provide a complete personal computer system with all hardware and software as required to program the proximity cards as well as to program and operate the locking control system. Provide all cables necessary for complete operation of the computer and peripherals. Minimum requirements for system components are provided as follows:

A. Central Processing Unit (CPU): The personal computer system CPU shall be dual core @ 2.4 GHz (Core Duo Intel processor or equivalent AMD). The system shall have at least 4 gigabytes of RAM and be equipped with at least a 250 gigabyte hard drive. The unit shall be furnished with a CD-RW drive and a DVD-RW drive. The CPU shall be equipped with at least two communications ports along with all other necessary hardware and software to support all components of the system. The system shall have a parallel port, a serial port, no less than three USB ports, and a 10/100/1000 Mbps (Gigabit) Ethernet port. The system shall have a graphics card with 512 megabytes video memory or higher and DVI/HDMI ports compatible with the provided monitor. The CPU, monitor, keyboard, and entire system shall be manufactured by Hewlett Packard, Dell, Toshiba, or Sony.

B. Monitor: The monitor shall be at least a 21" Flat Screen.

C. Keyboard: The keyboard shall be a standard QWERTY keyboard with numeric keypad on the

right side.

D. Mouse: The mouse shall be a Microsoft or Logitech three-button mouse. Track balls will not be accepted.

E. Software: The computer shall be furnished with the vendor's latest Windows-based software installed.

2.3 Power Supplies: The Power Supplies shall provide power to the Card Access Control Panel and the door locks and shall be provided with batteries for up to 24 hour operation in the event of a power outage.

2.4 Card Readers: Card readers shall be proximity type readers. They shall be suitable for indoor and outdoor use.

2.5 Biometric Readers: Biometric readers shall be a fingerprint type reader.

2.6 Cards: Furnish 200 proximity photoID cards for the Owner's use.

2.7 Provide camera and all equipment necessary for producing and installing color photographs on the cards. Provide supplies for 200 proximity cards.

2.8 Magnetic Locks: The magnetic door locks shall be rated for 1500 pounds holding force. Provide all brackets necessary for mounting on doors where magnetic locks are shown. Provide strikes on doors as required.

2.9 Motion Detectors: Provide passive infrared (PIR) motion detectors as required per NFPA 101.

2.10 Exit Pushbuttons with Timers: Each exit pushbutton shall be provided in a stainless steel wallplate on a flush-mounted single gang outlet box. They shall be of the double-pole, double-throw type and configurable with momentary or latching contact status. They shall operate within a temperature range of 32 degrees F to 158 degrees F.

2.11 Suppressor Kits: Provide two suppressor kits for each relay output. Install one suppressor kit at the Card Access Control Panel and one suppressor kit at the magnetic door lock.

2.12 Circuitry: Provide circuitry as required for optimum system performance, but meeting the following minimum requirements.

PART 3 - EXECUTION

3.1 All Door Lock Control System cabling shall be installed in raceways meeting the requirements of Specification 26 05 33 RACEWAYS.

3.2 Each cable passing from outside to inside the building shall be equipped with surge protectors at each end meeting the requirements of the manufacturer's specifications.

3.3 Provide fuses sized per manufacturers' instructions for all system components.

3.4 Test the entire system to ensure that it is completely operable prior to the pre-final inspection. Notify the General Contractor that you are to be present at the pre-final inspection.

3.5 Provide eight hours of instruction to the Owner on operation, maintenance, and modification of the system.

3.6 Provide a one-year warranty for the system and all components. The warranty shall begin at the

date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

SECTION 28 31 00 - FIRE ALARM SYSTEM

PART 1 – GENERAL

1.1 GENERAL

A. Furnish and install a complete and operable fire alarm system in accordance with the Contract drawings and all federal, state, and local codes. Equipment on the drawings represents the absolute minimum required for the project. Include costs for all other required devices and equipment required for a complete and operable code compliant system. Notify the engineer in writing of any devices required by code, but not shown, at least ten days prior to bid.

B. Comply completely with the latest edition of all applicable federal, state, and local codes including, but not limited to the following:

1) National Electrical Code (NFPA 70)
2) Life Safety Code (NFPA 101)
3) National Fire Alarm Code (NFPA 72)
4) The International Building Code
5) ANSI/ASME A17.1, Safety Code for Elevators and Escalators

1.2 SCOPE OF WORK

A. Provide all enclosures, hardware, software, devices, and all other components, material, and labor required to install, configure, and test the entire system to the satisfaction of the Engineer and all authorities.

B. All components of the system shall be manufactured by the same company. The system and its components shall be approved by UL and Factory Mutual.

C. All system components shall be installed by a franchised distributor of the fire alarm system having a repair and service department on call 24 hours a day, seven days a week. The repair and service department shall be located within 150 miles of the project.

D. Submit complete shop drawings showing all devices including mounting locations and heights and terminal-to-terminal connections. **Employ an independent third party testing agency that will be involved in certification of the system to review the shop drawings to ensure compliance with the contract documents and all applicable codes.**

PART 2 – PRODUCTS

2.1 Provide an intelligent, addressable fire alarm control panel complete with all equipment necessary to monitor and control the devices shown. The system shall sound a non-coded general alarm. Upon an alarm condition, the fire alarm control panel shall automatically report the alarm condition to a monitoring agency. Provide all telephone connections, circuitry, and conduit to perform this functionality back to the telephone backboard.

2.2 Provide a NiCad battery sized to operate the control panel without normal power for 24 hours, and then to alarm the panel continuously for at least five minutes (or as required by codes). Submit battery sizing calculations with the manufacturer's cut sheets and shop drawings.

2.3 All devices shall be addressable and shall be electrically supervised.

2.4 Smoke detectors shall be of the photoelectric type.

2.5 Duct detectors shall be of the air sampling type. Furnish complete with sampling tubes and duct housings.

2.6 Smoke detectors mounted under raised computer floors shall be of the photoelectric type. They shall be UL listed for installation in plenums.

2.7 Pull stations shall be of metallic construction. They shall be furnished with lexan shields and warning horns.

2.8 Horns shall be rated a minimum of 85 dB at 10'.

2.9 Speakers shall be square. They shall be wall-mounted to a 4" square box. They shall produce a minimum sound level of 85dB at 10'. They shall have adjustable taps for volume level adjustment.

2.10 Strobes shall have a nominal rating of at least 75 Cd.

2.11 Combination horn-strobe units or speaker-strobe units shall meet the specified requirements of the individual horns, strobes, and speakers.

2.12 Monitor all sprinkler system flow switches at the facility. Provide an alarm upon flow indication.

2.13 Monitor all sprinkler system tamper and supervisory switches at the facility. Provide a trouble signal upon tamper indication.

2.14 Provide duct detectors in the return duct of all air units. If a fresh air intake duct is installed, all duct detectors shall be mounted upstream of the intake duct. For air units with flow ratings greater than 15,000 CFM, provide duct detectors in both the return and supply ducts.

2.15 Provide all necessary relays and circuitry, and shut down all air units upon an alarm condition of the fire alarm system.

2.16 Provide all necessary equipment and circuitry for control of the elevator in accordance with ANSI/ASME A17.1, Safety Code for Elevators and Escalators.

2.17 Provide all necessary equipment and circuitry to automatically release the magnetic door locks upon an alarm of the Fire Alarm System.

2.18 Conductors shall be #14 AWG copper rated THHN/THWN. Provide larger conductors where required to compensate for voltage drop.

PART 3 – EXECUTION

3.1 All components and circuitry shall be assembled and installed per the requirements of all applicable codes and the manufacturer's recommendations.

3.2 All devices shall be mounted with their boxes flush in the walls.

3.3 Smoke detectors shall be mounted at least 36" away from supply and return vents.

3.4 All outlet boxes, junction boxes, and cover plates shall be painted red.

3.5 All circuitry shall be in concealed conduit sized per the NEC, but no less than 3/4" EMT. All fire alarm conduits shall be painted red.

3.6 The Fire Alarm System Contractor shall employ an independent third party testing agency to test and certify all system components, including each smoke detector, duct detector, and pull station prior to the pre-final inspection. All systems shall be completely operable prior to the request for a pre-final site observation. The system shall be tested in the presence of the Owner, Architect, and Engineer at the prefinal site observation.

3.7 Provide a one-year warranty for the system and all components. The warranty shall begin at the date of final acceptance of the building. During the warranty period, the system shall be repaired or replaced as necessary at no cost to the Owner. During the warranty period, a technician shall be on the job site within twenty-four hours of a problem report from the Owner.

END OF SECTION

ADVERTISEMENT FOR BIDS

Sealed bids will be received by the **City of Hattiesburg** at the Hattiesburg City Council Chamber located at **200 Forrest Street, Hattiesburg, MS, 39401** until **10:00 a.m.** local time on **Friday, December 21, 2018**, at which time all proposals will be opened and read aloud for:

Hattiesburg Public Safety Complex
701 James Street
Hattiesburg, Mississippi 39401

Bid documents may be obtained in hard copy form for a deposit of $500.00 per set of documents, made payable to Albert & McCleskey Associate Architects. 50% of the deposit will be refunded to all document holders upon the return of the documents to the Architect in good condition no later than 10 calendar days after the bid date. Official bid documents can be downloaded from Central Bidding at www.centralbidding.com. Electronic bids can be submitted at www.centralbidding.com. For any questions relating to the electronic bidding process, please call Central Bidding at 225-810-4814. Bid preparation shall be in accordance with Instructions to Bidders bound in the Project Manual.

A Pre-bid meeting will be held on Wednesday, December 5, 2018 at 10:00 a.m. at the Hattiesburg Public Safety Complex site. Attendance by all Bidders is strongly encouraged.

Each bid must be received in a sealed envelope which is marked in the lower left-hand corner with the legend, **"Hattiesburg Public Safety Complex Bid Package".**

No bid may be withdrawn for a period of sixty (60) days. The lowest and best proposal received will be accepted, subject to the provisions of Section 31-7-13 of the Mississippi Code of 1972, Annotated and Amended, and other applicable State law; but the Council reserves the right to reject any or all proposals received and to waive informalities or irregularities therein.
